CANNIBAL PLANTS.

AN IMPROBABLE STORY OF THE BORDERLAND BETWEEN VEGETABLE AND ANIMAL LIFE.

Some years ago a striking story was published in France describing a wonderful flesh-eating plant discovered by a great botanist. If we remember rightly the story recounted how a a certain collector discovered a plant of the flytrap species of so gigantic a size that it could consume huge masses of raw meat. Just as the fly-catching plant snaps up a fly and draws nutriment from the fly's dead body, says a writer in the London *Spectator*, so this one fed itself on the legs of mutton and sirloins of beef which were thrown into its ravenous maw. The botanist in the story, for some reason, possibly fear of having his plant destroyed as dangerous to public safety, keeps the existence of the plant a secret and preserves it in a locked-up conservatory. His wife, however, who is made miserable by his absorption of mind—he thinks of nothing but how to feed and improve his wonderful and fascinating plant—determines to follow him. This she does, accompanied by an old school friend of the husband. When the pair reach the inner conservatory they see, to their horror, the infatuated botanist tossing bleeding joints of raw meat into the huge jaws of a giant flytrap. They are at first petrified with horror. At last, however, the wife throws herself into the arms of her husband and implores him to give up dwelling with the horrible carnivorous monstrosity which he has discovered and reared. Unfortunately, however, the wife in appealing to her husband goes too close to the plant. Its huge tentacles surround her and then proceed to drag her in and the two stupefied men see the plant begin to devour its victim. Fortunately, however, the friend catches sight of an ax lying near and seizing this he strikes at the root of the plant. A few frenzied blows do the necessary work, and the flesh-eating plant tumbles to the ground and releases from its clutches the terrified woman. The botanist, however, cannot survive his most cherished discovery, and with the exclamation. "You have killed my plant!" he falls back dead. The story is good enough as a story, but if we are to believe an article said in the *Review of Reviews* to be taken from *Lucifer*—it is only another instance of fiction being prophetic and anticipating scientific discovery. According to the article quoted by Mr. Stead there has been discovered in Nicaragua a flesh-eating, or rather man-eating, plant, which for horror is quite the equal of the novelist's imagination. This plant is found, it is asserted, in Nicaragua, and is called by the natives "the devil's snare." In form it is a kind of vegetable octopus, or devil fish, and is able to drain the blood of any living thing which comes within its clutches. We give the story with all reserve, but it must be admitted to be circumstantial enough in all its details to be possible. It appears that Mr. Dunstan, a naturalist, has lately returned from Central America, where he spent two years in the study of the plants and animals of those regions. In one of the swamps which surround the great Nicaragua Lake he discovered the singular growth of which we are writing. "He was engaged in hunting for botanical and entomological specimens when he heard his dog cry out, as if in agony, from a distance. Running to the spot whence the animal's cries came, Mr. Dunstan found him enveloped in a perfect network of what seemed to be a fine, rope-like tissue of roots and fibers. "The plant, or vine, seemed composed entirely of bare, interlacing stems, resembling, more than anything else, the branches of the weeping willow denuded of its foliage, but of a dark, nearly black hue, and covered with a thick, viscid gum that exuded from the pores." Drawing his knife, Mr. Dunstan attempted to cut the poor beast free; but it was with the very greatest difficulty that he managed to sever the fleshy, muscular fibers of the plant. When the dog was extricated from the coils of the plant Mr. Dunstan saw, to his horror and amazement that the dog's body was bloodstained, "while the skin appeared to have been actually sucked or puckered in spots," and the animal staggered as if from exhaustion. "In cutting the vine the twigs curled like living, sinuous fingers about Mr. Dunstan's hand, and it required no slight force to free the member from its clinging grasp, which left the flesh red and blistered. The gum exuding from the vine was of a grayish-dark tinge, remarkably adhesive, and of a disagreeable animal odor, powerful and nauseating to inhale." The natives, we are told, showed the greatest horror of the plant, which, as we have noted above, they call the "devil's snare," and they recounted to the naturalist many stories of its death-dealing powers. The neighborhood inhabited by that Amazonian tribe, who, by the use of some secret can reduce a human corpse to a tenth of its original size and so produce a perfectly proportioned miniature mummy of the dead man, would have been a good locality in which to "place" the tale of the cannibal plant. Again, Nicaragua is within the tropics and plant life there is therefore specially gross and vigorous. Besides, there is no inherent impossibility in the idea of a flesh-eating plant. It is merely a question as to whether evolution has or has not happened to develop the fly-eating plant on a sufficiently large enough scale to do what is related of the vampire plant. No one who has seen the ugly snap which that tiny vegetable crab, Venus' fly-trap, gives when the hairs inside its mouth are tickled by the human finger in the way that a fly would tickle them by walking can doubt for a moment that the development of a plant capable of eating or sucking the blood of a man is only a matter of degree. Even in England there are plants which act on a small scale exactly the part asserted to be played by the vampire vine—for example, Lathræa squamaria, the toothwort, "a pale chlorophyl-less parasite found in British woods." There are known to be several hundred dicotyledons which, in some way or other, catch and live on animal food. From such a basis the evolution of a giant and man-eating dicotyledon is within the bounds of possibility. We cannot help hoping very much that the story of the vampire vine will turn out to be true, for if it does the botanists will be able to try some curious experiments as to how these vegetables which are half animals, digest, and whether their movements can properly be regarded as muscular movements. It is true that Darwin administered extremely homeopathic doses (.000095 of a milligramme) of nitrate of ammonia to a sundew and found the plant responded to the drug exhibited, but it would be far easier to conduct experiments on a larger plant. Even as it is we know that the insect-eating plants secrete not only an acid, but a "peptonizing ferment" for the purposes of digestion. They also feed, like animals, "on substances at a high chemical level." More than 150 years ago Linnæus noted that the Lapps "used the butterwort for curdling milk, a property due to a rennet-like ferment which the plant has in addition to the digestive or peptic." Again, we are told that Dr. Burdon Sanderson has "detected electric currents similar to those observed in the neuro-muscular activity of animals." The borderland between animal and plant life occupied by the insect-eaters is, indeed, one of the most curious and interesting fields of biological study; and if a plant as large as the vampire vine could be obtained to experiment with discoveries of enormous importance to science might very likely be made. The vampire vine would doubtless stand a grain of calomel after a heavy meat meal without damage or annoyance.

Extensive Territory.—The Dominion of Canada has an area of 3,382,000 square miles, and comprises one-sixteenth of the land surface of the globe.

Contrary Indications.—A flock of wild geese flew north this morning, indicating warm weather, and another flew south, indicating cold weather.—*Atchison Globe.*

NATURAL GAS EXHAUSTED.

From those sections of both Pennsylvania and Ohio where natural gas has been almost exclusively used for fuel during the past few years, comes a uniform lamentation over the decreasing supply of that wonderful fuel. Decreasing pressure and failing supply in the Pittsburg and Indianapolis districts have been followed by the same phenomena in Ohio, and no one now doubts that the beginning of the end of natural gas is at hand. The comforting theory which was so much exploited a few years ago, that this gas was being constantly produced by subterranean agencies, and the other one, equally comforting, which was so tenaciously held by many in the gas belt, that as rapidly as one field became exhausted another would be found to take its place, have alike proved untenable. It must now be conceded that the supply is limited. The facts that prove this view are found on every hand throughout the gas belt. The northwestern Ohio district was always richer in this cheap fuel than the central part of the State, and the failure is therefore postponed somewhat, but it is certain, nevertheless. At upper Sandusky, which drew its supply from the outlying wells of the Findlay district, the use of gas has been discontinued entirely, the company being forced to shut off the supply by the alarming decline in pressure and the appearance of water in the wells. The manufacturers of Fremont have been shut off by the Northwestern Company, even after offering to pay metre rates for their fuel. At Toledo the mills are beginning to use crude oil instead of gas, because of failing supply, and at Findlay one company employing 300 men has been unable to get gas for the same reason. In short, in nearly all the natural gas towns the return to wood and coal or oil has begun, and while Findlay is the least affected, and will doubtless have gas for several years, the fact that even in that, the great centre of the gas belt, where the most wonderful sources of natural gas in the world have been found, the necessity of a careful husbanding of resources is apparent, proves that the end is, at furthest, probably not more than five years away. The failure of gas is accompanied by the appearance of oil. Many gas wells become oil producing when "shot," and oil is said to be finding its way into the gas mains in many places. This makes it certain that the use of crude oil for fuel will follow the failure of gas, and that the natural wealth of northwestern Ohio is accordingly far from being exhausted. This fact, too, will doubtless, in part, break the heavy loss that would otherwise have fallen upon those who have invested in the gas belt. This sum is large. In the Findlay district alone probably $38,000,000 to $40,000,000 have been invested in lands, leases and wells since gas was discovered, and expenditures are still being made. The aggregate throughout the gas fields is several times this. It is fortunate, indeed, that the prevalence of oil will prevent the great loss that would otherwise occur.

IS HYPNOTISM A DEFENCE?

The extreme views on hypnotism which some of the French medical experts expressed during the recent Eyraud and Bompard murder trial in Paris find indorsement among some prominent American investigators. Several New York physicians, as the result of their experiments affirm that hypnotic subjects may be made to commit real or imaginary crimes for which they are in no degree responsible. Dr. G. M. Hammond said to a reporter: "I have two patients who will, at my command, do anything from the commission of murder, forgery or burglary down to lesser crimes. They will do these things either while in the hypnotic trance or at any specified time afterwards, and they will not know why they do them or that I have influenced them in the matter. After the commission of a supposed unlawful act they will show all the fear of detection and the desire to escape which an ordinary criminal would manifest. An eminent New York specialist in neurology, who has made hundreds of experiments, says: 'Several months ago I gave a subject in the hypnotic state what he thought was a pistol, and, pointing to another man, I said: 'There is a very bad man. He is a murderer and an enemy of society. He ought to be killed and I want you to shoot him.' The subject hesitated a moment and looked distressed, but finally, on repetition of the command, he raised his arm and fired, as he supposed, killing the man. Soon after another physician, handing the same subject an imaginary pistol, told him to shoot himself through the heart. With only slight hesitation the young man put the pistol to his heart and fired. He fell in a heap on the floor. His condition was one of almost complete collapse and we were greatly alarmed. It was a long time before we could revive him. We never tried that experiment again. If the power of hypnotic suggestion is so great that a subject will commit suicide at command, you may be sure there is no other extremity of action to which he may not be induced to go."

GARBLED REPORTS.

We were shown recently a circular endorsed "Extracts from the 21st Annual Report of the State Board of Health of Massachusetts, published for the benefit of grocers and consumers." This has been extensively circulated among New England grocers, evidently for the purpose of injuring spice dealers from other States than Massachusetts. It is true that these so-called extracts are taken from the report they claim to be, but it is also true that in making these extracts the names of all Boston spice dealers, which were given in the original report as having been found dealing in adulterated goods, have been omitted. This is dishonest, and will surely react upon the very people this garbled report was printed to help. Massachusetts spice men are not any more honest than others. They only comply with the law when compelled to do so.

THE WIZARD'S ROD.

A novel device for detecting the presence and nature of a mineral exposed in rock or earth is the electric mineral ore detector. This apparatus seems destined to be extremely useful to miners, as it reduces to a certainty the question of ascertaining the exact mineral value of the rock under test. To prospectors it is particularly useful, for though it consists of a battery and spark coil, with conductors ending in two platinum points, all are so compactly arranged that they can be carried on the back. On placing the two platinum points against a rock, the presence of metal is indicated by the appearance of a spark, the flame and color of which will afford an indication of the nature of the body which the electrodes have touched. Such is the trustworthiness of this device for purposes of testing that by placing the electrodes against a rock containing metal in a free state, its presence may be detected by

COLGATE'S COLEO.

A PURE PETROLEUM PRODUCT FOR TOILET AND MEDICINAL USE.

merely applying one electrode and passing the other rapidly over the surface. The detector is especially useful in determining the presence or absence of metal in old shafts or tunnels; while, when applied to the walls of a shaft or cut, it can be depended on for the recovery of a lost lead, unless the lead is entirely pinched out. It is said that a novice can handle this apparatus almost as successfully as an old miner, and the sorting of ores can be accomplished with certainty, being determined by the color of the spark produced. This handy miner's companion is further valuable in being a ready means of exploding blasts in connection with electric primers.

WHO IS STRUCK?

It seems to be a thankless task for a newspaper to expose a humbug. The public are so ready to be gulled that the very fact of exposure very frequently is accepted in the light of commendatory advertisement, and the thing held up to scorn is at once hunted up and purchased. The *National Druggist* of St. Louis in its issue of December 15, gives a double-leaded rap at the anomaly referred to in the following editorial squib: "The Radam Microbe Killer and the *Druggists' Circular* continue to get a good deal of gratis advertising in the medical journals on the strength of the $200,000 suit gotten up between them. The *Circular* continues to call on the doctors for support in its dire extremity, and Radam meanwhile gets in his little work in posing as the stern defender of wonderful microbicide. By the way, why don't the parties in interest accept our suggestion as to the surest method of testing the Microbe Killer? Give it a show, and if it doesn't instant neously kill the inventor of "drug journal censuses," manipulator and manufacturer of statistics, and discoverer and godfather of "Baker Comm.," Mr. B. Lillard, Esq., it isn't worth a hurrah in Hades, and can safely be defied by the sickliest and puniest microbe that ever crawled out of a spoiled culture medium."

MORE ROYAL LIES.

The Royal Baking Powder Company has issued another of its characteristic advertisements. It is headed "The Official Report," and is ostensibly signed by "Willis G. Tucker, M. D., Ph. D., Analyst." In this advertisement they cunningly try to convey the impression that the official report of the Health Board of the State of New York has certified that their baking powder "contains no impurities, adulterants, or unwholesome constituents whatever." This no respectable chemist can truthfully say, so long as the Royal persists in padding the strength of its powder with ammonia. This deceiving advertisement further attempts to throw sand in the public eyes by asserting that the cream of tartar used by the Royal Baking Powder Company is purer than that used by other manufacturers. The falsity of such a statement becomes apparent when it is remembered that all cream of tartar manufactured in this country is controlled by a pool, and is made of one standard, and the product of the different manufactories is interchangeable. The concluding statement that "the Royal Baking Powder is superior to any other powder which I have examined," is so condemnatory of Dr. Tucker's experience that we cannot believe he ever wrote such a self-stultifying certificate, especially as we well know the Royal Baking Powder Company's methods of manipulating chemists' certificates. In this case, however, they have evidently gone too far, and Dr. Tucker must in self-defence stop such an improper use of his name. The public is not any longer misled by such miserable misstatements.

DISAPPEARING TYPES.

THE THEORY OF NATURAL SELECTION ILLUSTRATED BY THE GRADUAL EXTINCTION OF ANIMALS.

A startling publication is on the point of being issued by the Smithsonian Institution, which will show that many of the most valuable species of animals at present inhabiting the world will inevitably be driven off the face of the earth and rendered absolutely extinct within a few years from this date. For example, the elephant is already doomed. Each year 100,000 of these pachyderms are slaughtered to supply the market with ivory. Up to within a comparatively recent period, commerce drew chiefly upon the great stores of "dead" ivory in possession of African natives, which had accumulated for centuries; but now this reserve stock has been exhausted, and all the tusks exported from the Dark Continent must be got "green" by hunting live elephants. Thus the herds are being rapidly wiped out, not to mention the incidental fact, according to Explorer Stanley, that every pound of ivory that reaches Europe costs the life of a man, woman or child, while every twenty tusks are secured at the price of an entire district, with all its people, villages and plantations. This, of course, is due to the intimate connection which exists between the ivory-gathering business and the slave trade. You will get some notion of what 100,000 elephants mean if you will consider that, placed in line, that number would stretch 180 miles. As for the slaves, they are secured for the purpose of carrying ivory to the coast for the Arabs, who attack and destroy the native villages, carrying off into captivity those of the inhabitants who are serviceable as porters and killing the rest. In this way whole regions in Africa have been depopulated and laid waste. It is fashion, however, that is most importantly responsible for threatened extinction of animals well worth preserving. To prove this statement, reference is made to a single recent auction sale in London, at which were disposed of under the hammer 30,000 monkey skins, 250 000 Australian opposums' skins, 400,000 humming-birds' skins, 6,000 skins of birds-of-paradise, and 360,000 assorted birds' skins from India. In all the collections in the world, public and private, there do not exist so many birds' skins, stuffed or otherwise, as the total of these amounts to. Evidently the beautiful birds of the earth must go, and Australian opposums and monkeys have no show whatever. One dealer last year sold 2,000,000 skins of birds. Every one knows by this time that the fur seals are also doomed. Having been altogether exterminated from the rookeries in the southern seas where they used to congregate in such countless myriads, they are now being wiped off from their last resting-place on the Pribylov Islands, in Behring Sea, by remorseless pirates in schooners, who kill ten for every one they get. A like fate awaits at short notice the hair seal, 875 000 of which were slain last year for leather and oil. Even the alligators, crocodiles and other reptiles are not spared. Even they must disappear, because their hides are wanted for reticules, pocketbooks and other "fancy articles." Man—more particularly the Caucasian—is the most destructive of animals. His appetite for killing is insatiable, and to this mere taste for slaughter for its own sake the marked and rapid changes at present being wrought in the fauna of the world are largely attributable. Among the valuable beasts now swiftly succumbing to the sportsman's rifle is the true zebra, which is confined at this moment to a small area in south Africa, while the giraffe is quickly disappearing from the same cause. Let loose a white man with an equipment of improved weapons in the wilds, and he will call it "sport" to slay wantonly everything that he can get a pop at—not for food, but simply for the sake of taking away life. It has remained for civilization to thoroughly develop this type of savagery. The only parrot known to this country, which was formerly plentiful as far north as Kansas, is now being finally extirpated in Florida by visitors who kill the bird for "sport." They are naturally tame, and it is easy enough to knock over half a dozen at one bang. They are no good to eat, but then they make such a pretty mark for a gun! A while ago the so-called "passenger pigeon" flew by millions in the Ohio Valley and as far east as Massachusetts. Now but a very few of them are left. They have been shot by wholesale, and while they lasted were commonly utilized for shooting from traps. It is great sport to take a pigeon that has been captured in a net, put him in a box, and pop the poor creature at short range when he flies out at a signal, with about one chance in fifty for his life. In this way useful animal after animal is being driven to extinction. The list of those which civilized man has driven off the earth, where God is supposed to have put them for his use, will be an appalling thing to think upon a short time hence. Wherever a valuable beast is found in great and profitable numbers, the first thought seems to be to go and wipe it out. That is particularly a Caucasian instinct. The giant tortoises of the Galapagos Islands, which have for a long time past been most serviceable as food for supplying ships that touched there, are being finally disposed of. No more big ones, of the sort that weigh from 500 to 700 pounds apiece, remain, but only a few little fellows not worth taking. These are land turtles, and used to be caught crawling about on the island sluggishly, so little trouble being required to gather them in that a single party of sailors would often bring in as many as twenty from one expedition. Now they are nearly all gone, and soon there will be none left. As to that enormous, but comparatively helpless beast, the walrus, its doom is likewise sealed. Before the weapons of those who pursue it to get its hide for boats and leather, and its tusks for ivory, and its whiskers for opium-pipe picks, it is quickly disappearing. The method adopted by the hunters is to approach a group of walruses on the ice and, after picking off the more alert bulls from a safe distance with rifles, slaughter the herd at leisure. It was somewhat in the same way that the great arctic sea-cow, now long extinct, was utterly annihilated. This mighty mammal, related to the manatee, and dugong of southern waters, was first discovered on what is now known as Behring Island by Behring's expedition in 1741. An enthusiastic naturalist attached to Behring's party described it as being, when full grown, thirty feet long, twenty feet around the body, and about 8000 pounds weight. It had a small and toothless head, and its skin was dark and rough like tree bark. The hide was considerably over an inch in thickness, and so tough that the sailors had to chop it with axes. A few years ago Dr. Stejneger, of the Smithsonian, visited Behring Island for the purpose of procuring some bones of this extraordinary creature and did succeed in obtaining an entire skeleton, the dimensions of which confirm the reports made by the naturalist referred to. These sea-cows were accustomed to herd about the mouths of streams and live upon sea-weeds, which required no chewing. They were stupid and almost helpless, owing to their bulk and clumsy build. For many years vessels sailing

for the northwest coast of North America were accustomed to stop in at Behring Island to lay in a stock of fresh and salted sea-cow. Probably there were not more than 2,000 of the beasts at the beginning; they were slow in reproducing their species, and the last of them was killed in 1767. In addition to this ruthless murder has also exterminated recently the California sea-elephant, a huge amphibious mammal of the west coast, which grew to be nearly twenty-five feet in length and had a long proboscis, whence the name given it was derived. These great beasts, sought for their flesh and oil, were driven by the hunters up into ravines away from the shore and butchered by wholesale, the bodies of those first killed serving as a barricade to prevent the others from escaping. So in this way the last of them has probably been destroyed, though an effort is at present being made to find a pair alive for propagating from in the National Zoological Park here, where much attention will be devoted to the preservation of species which would otherwise be lost to the world—the buffalo among the number. Everybody knows the history of the great auk's extermination. A single shell of one of its eggs, without the contents, was sold the other day at auction for $1,500. And yet this bird was found on Funk Island, off the Newfoundland coast, sixty years ago, in numbers that were simply countless. But the people from the mainland used to go over to the island in summer and kill them by myriads, to eat and for their feathers. They were very appetizing roasted, and were so fat that they served for fuel also, so that half a dozen great auks did to cook a meal of their brethren for dinner. The result of this was that forty years back the last of these interesting fowls perished, and there is no longer one of them in existence. The Smithsonian has practically a corner on their bones. A while ago the institution sent a distinguished osteologist, Professor Lucas, to Funk Island for the purpose, and he brought back nearly a barrelful of such remains. If you want a skeleton now, you will have to send to Washington for it, and it will cost you about $600. Another bird that has become extinct lately in a very extraordinary and unaccountable fashion is the Labrador duck. This fowl was black and white in color and in no way very valuable to man, inasmuch as it fed on fish and had a corresponding flavor; but the interest attaching to it is due largely to the curious manner of its disappearing. So far as is known, there were never very many of these ducks, which used to be shot occasionally by sportsmen along the North Atlantic coast from Labrador to Chesapeake Bay. A few used to be captured each year by a taxidermist at Camden, N. J., on a trot-line, which he set for them baited with fish just under the surface of the water. About 1870, however, they ceased to be found, and since then no Labrador duck has ever been seen. Various theories have been formed to account for the mystery, it having been suggested among other things that a distemper was accountable in the premises. Others have surmised that the birds, being few, got mixed up with the flocks of other species and were lost. One danger that has to be encountered by birds of a not very numerous variety is that, in migrating, their flocks will lose sight of each other. The pair of stuffed Labrador ducks now in the possession of the National Museum at Washington were killed by Daniel Webster, and were themselves the originals from which the great Audubon made his plates of the creature. A still more astonishing instance of the extinction of a species is found in the case of the tile fish, which was first found, so far as science is aware, by vessels fishing for cod a few years ago in waters south of Long Island. This fish grew to be forty pounds in weight and was very palatable, so that the fish commission thought that it might be propagated and rendered most valuable for food purposes. Unfortunately, just as the commission was on the point of beginning operations with this end in view, a vessel coming in reported that it had run across, at a considerable distance out from land, great quantities of floating fishes, most of which were tile fish. From that time until now not one tile fish has ever been seen, so that evidently the entire species was wiped out at one fell swoop. One theory entertained is that an arctic current, bearing icebergs, came unusually near the shore and suddenly reduced the temperature of the water to such a low point that the tile fish were all killed. Speaking of extinct fish reminds one that the halibut is growing scarcer year by year, while lobsters are becoming so few and small that the canneries find it difficult to obtain supplies, and shad and salmon are only kept up by the propagating efforts of the fish commission. Most interesting of extinct birds is the dodo, which was a kind of pigeon, somewhat larger than a swan, very stupid, and unable to fly, its wings being almost rudimentary. It weighed fifty pounds when full grown, had a huge bill, was provided with a tail that resembled a feather-duster, and waddled about on very short legs. Its name means, in the Portuguese tongue, "simpleton." The dodo is first mentioned by the Dutch Admiral Van Neck, in his account of a voyage to the island of Mauritius in 1595. His sailors and those of subsequent vessels which touched there destroyed the unfortunate bird wantonly, and it was entirely extinct one hundred years later. Two giant birds of antiquity there were which modern science knows comparatively little about, though some of their bones and even their eggs are to this day preserved in museums. One of these was the epiornis of Madagascar, which stood twelve feet high and weighed one thousand pounds. Only two of its eggs have ever been discovered, and they were found in graves. Each of them was as big as six ostrich eggs, or one hundred and forty-three good-sized hen's eggs. In ancient times the Arabs used to go in their trading vessels as far down the African coast as Madagascar, where they saw these astonishing fowls, bringing back accounts of them which were destined to give rise to the fables concerning the roc of the "Arabian Nights." In New Zealand, at a later period, is known to have existed an even heavier bird than the roc, known to science as the dinornis, which was not quite so tall, however. It stood about nine feet high when grown. The bones of one leg of this creature are exhibited at the National Museum, and they measure six feet from foot to hip. The dinornis did not have even rudimentary wings. It became extinct about the time Captain Cook visited New Zealand, and he might very possibly have found one more alive had he tried. When he arrived the natives were still wearing the feathers of the bird for ornaments. Around certain hot springs in New Zealand great accumulations of the bones of the birds were subsequently found. It is supposed that some sudden change in the New Zealand climate compelled them to gather for warmth in these places, and there they died. It reminds one of a very plausible theory that is entertained regarding the great beds of fossil animals found in the West in this country. Stress of weather, the notion is, crowded the beasts to a sheltered place, and there a blizzard came and destroyed them en masse. —Rene Bache, in *Boston Transcript.*

THE PORCUPINE PLANT.

A LATTER-DAY ANANIAS, WITH ALL MODERN IMPROVEMENTS.

A few years ago, says the eminently accomplished liar of the Albany (N. Y.) *Telegram*, I had a thrilling experience in southern Georgia, when I saved a negro from the fatal embrace of the terrible man-eating plant. This carnivorous wonder is indigenous to the banks of the upper Nile, but for convenience a little colony has established itself about 100 miles west of Savannah, and its members maintain their pristine fondness for the Ethiopian. The plant is four to six feet high, and has long, narrow leaves, that change the second year to fan-shaped. Each plant produces only one flower, which is cup-shaped, eight feet in diameter, and borne on a scape twelve feet long; it is composed of five petals, one being very much longer than the others. The color of the bud is crimson, of the open flower, purplish-green embroidered with yellow. It is very beautiful, and fragrant as the attar of roses, that is, till it eats a man, then "the smell is like that of a charnel house." From the roots fine nerves run out in all directions for a rod or more and communicate with a brain in the stem of the plant. The leaves are thickly armed with keen-pointed, poisonous thorns, behind which are sacks filled with compressed air. As soon as a negro treads upon the root-nerves all the leaves facing in that direction discharge a broadside of their deadly thorns into the darky, and the root-nerves emerge from the ground and envelop, strangle and devour him. "These man-killers are particularly shunned by the negroes, who say that a porcupine plant that has once killed a man becomes rapacious for human blood, and shoots out its tendrils for many rods around to entrap unwary negroes." They also call it "Devil Plant."

CALIFORNIA WINE.

ARPAD HARASZTHY AND THE THIRTEEN CLUB

Once more California wine has won a victory in a fair contest with the foreign product, and to the house of Arpad Haraszthy & Co. the honor thereof is due. One of the most famous social clubs in the United States is that peculiar organization known as the Thirteen Club, of New York. Its roster comprises 2,000 of the leading members of society of the metropolis, and this being the case, it is hardly necessary to say that the club members are competent judges of table wines. The organization has been in existence for many years, and heretofore the honor of appearing on its table has been accorded the imported article. However, the progress made by California wines during the past year in the New York market has borne its legitimate fruit, and for the first time in the history of the Thirteen Club the products of the Golden State have been given the preference at their banquet table. The annual feast of the club was held on Saturday evening last, at which over 2,000 covers were laid. The wine list included only the wines carried by the house of Arpad Haraszthy & Co., as follows: Eclipse, Extra Dry; O. V. Chablis, 1886; California Punch; Port, Alto Viejo; Sherry Capay (1883); Reisling, 1885; Burgundy, 1884 (Santa Cruz); O. V. Zinfandel, 1885; Chateau d'Orleans Gutedel, 1886 (Sonoma); Madeira, 1884 (Esparto); Muscatel, 1886 (Yolo); Brandy, 1883. Messrs. Haraszthy & Co. are to be congratulated upon the signal victory that has been won by their wines.—*Pacific Wine and Spirit Review*, Dec. 15, 1890.

Quick Death.—Oil of peppermint in water, diluted even to one part in one million, will kill cockroaches in an hour.

Dry Air.—A small box filled with lime and placed on the shelf in a pantry or closet, will absorb dampness and keep the air in the closet dry and sweet.

Poor Device.—A self-igniting cigar has been invented. A fulminating substance is placed in the tip, and a light produced by friction, after the manner of an ordinary match.

Corn Cure.—Dissolve a few pearl buttons in the juice of a lemon. A creamy ointment will be produced in a few days, and this, applied on a rag for a few days, is said to be a perfect cure for corns.

Rope Protector.—Dry ropes immersed for four days in a bath containing twenty grains of sulphite of copper to a quart of water are for some time preserved from the attacks of animal parasites and rot.

Steel Balloons.—It has been proposed to make the upper half of war balloons of very thin steel, and the lower portion of ordinary balloon material, the whole so constructed as to hold hydrogen instead of ordinary gas.

SILVER.

ITS SCIENTIFIC, MONETARY AND COMMERCIAL RELATIONS.

Silver has always ranked next to gold among the common precious metals. Like gold, it is a "noble" metal in that it does not oxidize when heated in the air; and although it forms more stable compounds with other elements than gold, yet it is readily reduced to the metallic state by comparatively weak reducing agents. This quality, together with its beautiful appearance and its great malleability and ductility, renders it particularly adapted for its manifold ornamental uses, while its wide diffusion, in comparatively small amounts, formerly rendered it an excellent material as a standard of monetary value; but of late years the greatly increased supply from the Western mines has made its value much more variable, and unfitted it for purposes of coinage. Silver is found native, or in the metallic state, in both crystalline and aborescent forms. It also occurs amalgamated with mercury, and as chloride and sulphide. In most cases, however, the silver occurs as a sulphide, in connection with much larger proportions of the sulphides of lead, antimony or iron. Galena or sulphide of lead, a very common mineral, usually contains varying proportions of silver, and the ores of copper often contain enough of the more precious metal to pay for its separation. The extraction of silver from its ores requires long and rather complicated processes, but on a large scale it can be accomplished very cheaply and a comparatively poor ore will pay for its working. There are many old mines in Mexico and the West of which the refuse left by the ancient miners can be worked over at a profit. Unlike gold, which always occurs in the metallic state, the ores of silver are not readily recognized or worked by savage or semi-civilized peoples, and it has occasionally happened that among such peoples silver has been valued higher than gold; but the usual ratio between the price of silver and gold of about 1 to 20 has obtained more or less constantly for many years. Silver is the best conductor of heat and electricity known, slightly exceeding copper in this respect, the physical and chemical relations between these two metals are very close in many other ways, and if the "transmutation of the elements" is ever accomplished,—a very unlikely matter, by the way,—we may expect that these two metals will be shown to be at least brothers in the chemical family. The easy reduction of salts of silver to the metallic state renders it particularly adapted for electro-plating. Formerly the plating of cheaper metals by silver was accomplished by amalgamation with mercury, or other chemical means, but these processes have been almost entirely superseded by the use of the electric current, which rapidly decomposes a solution of cyanide of silver, and deposits a bright and perfect coating of the metal upon articles immersed in it. Silvering upon glass is effected by means of certain organic substances which have the power of precipitating silver from its solutions. When a solution of oxide of silver in ammonia is gently heated with Rochelle salts, glucose, glycerine, or tartaric acid, in a clean glass or porcelain vessel, a bright coating of metallic silver is deposited on the sides. Glass door-knobs, small mirrors, lantern reflectors, and the ornamental glass globes sometimes placed in gardens or parks, are silvered in this way, as well as the mirrors used in certain reflecting telescopes. Although silver has but little affinity for oxygen, it unites with the allied element, sulphur, more readily than any other metal. The "tarnish' which articles of silver take when exposed to the air is due to the formation of a thin film of sulphide, from the traces of sulphur compounds usually present in the air. The discoloration of a silver spoon with which an egg has been eaten is a familiar example, and has led to the manufacture by enterprising jewelers of platinum egg-spoons, which are unaffected by the sulphur compounds present in this popular breakfast dish. Every one who has carried matches and silver coins in the same pocket must also have noticed this undesirable combination. The most remarkable chemical property of silver, however, is found in its relation to light. It does not stand alone in this respect, for compounds of iron, chromium, and many other substances have their composition modified by this mysterious form of energy of the light beam; but silver is pre-eminent in this respect, and the wonderful change which is caused by this means is a film of chloride, bromide, or iodide of silver, is the basis of the most beautiful modern art of photography. Many years ago it was noticed that chloride of silver blackened when exposed to the sun's rays, and from this simple observation the labors of Daguerre, Niepce, Draper, and their many successors have led to the present remarkable development of an art which produces pictures superior to the works of the best artists, at a nominal price, and by a process so simple that it is successfully practised by thousands of amateurs, with no especial scientific knowledge, as a recreation and amusement. This action of light upon certain salts of silver is especially remarkable as showing the connection between matter and energy, or more strictly, between these forms of energy known as chemical affinity and actinism. The molecules of bromide of silver in the sensitive film are held together by some attractive force which we know little about, but call chemical affinity. Something—some force or energy—comes to us in the sunbeam which enters into these molecules and forces them apart into other combinations; but just what it is or how it is accomplished is something which we cannot explain. In the case of the element selenium, its electrical relations are simply modified by the disturbing influence of the solar radiant energy, thus showing an intimate connection between them; and although it has long been known that light, heat power, actinism, electricity and chemical affinity were but different manifestations of a single form of energy, the results of modern investigations tend to show that the connection between them is much closer than has ever been suspected, and that we are, perhaps, on the eve of discoveries in regard to the nature and properties of matter and energy which will revolutionize the theories formulated from the facts at present known to us.—*Popular Science News.*

EARLY STANDARDS.

WHAT THE ANCIENTS USED FOR WEIGHTS AND MEASURES.

The jewelers of the middle ages used in their delicate scales the hard brown seeds of the Moorish Carob tree (Ceratonia siliqua), and the weight of diamonds is still reckoned by carats, each carat being equal to $3\frac{1}{6}$ grains troy. The earliest attempt to regulate British weights and measures appears to have been suggested by this example: In 1266 it was declared by statute that "an English penny, called a sterling, round and without any clipping, shall weigh 32 wheat corns in the midst of the ear; and 20 pence to make an ounce, and 112 ounces 1 pound, and 8 pounds do make a gallon of wine, and 8 gallons of wine do make a London bushel, which is an eighth part of a quarter." We have here the basis of the British system of reckoning as it survives to-day—the grain, pennyweight, ounce, pound, gallon, bushel and ton, and 240 silver pence equal to a pound sterling. The British gallon is still used for both dry and liquid measure, and the traditional relation between the pound and the gallon is set forth in the old rhyme, which declares that

A pint's a pound
The world around.

In 1324 the measures of length were defined by a similar statute providing that "three barley corns, round and dry, laid end to end," shall make 1 inch, 12 inches a foot, and 3 feet a yard. The 32 wheat corns, adopted as the basis of the British system, appeared to have weighed $22\frac{1}{2}$ grains troy, so that the pound of 1266 was equal to 5,400 grains troy. This is the old Saxon pound. The pound troy (poud du roy) is the Roman pound, and was doubtless in use simultaneously with the Saxon pound for hundreds of years, but is first mentioned in the statutes of 1414, and was ordained as the standard weight for gold and silver in 1527. As 24 grains make a pennyweight troy, the new pound contained 5,760 grains, exceeding the old weight by 360 grains, or three-quarters of an ounce. The strict pound of 12 ounces was used only in weighing the precious metals, and, with different subdivisions, for the costly drugs and medicines dealt out by apothecaries. For heavy goods (avoirs du poids) a more liberal measure was given, like the baker's dozen, and 15 ounces was called a pound. In the same way 28 pounds were a quarter, and 112 pounds a hundred-weight, allowance being made for waste or wrappings. The increase of the pennyweight to 24 grains in 1527 raised the value of the ounce to 480 grains; and accordingly the pound of commerce containing 15 ounces was raised to 7,200 grains. As 250 grains of wine were reckoned equal to a cubic inch, the gallon, containing 8 of these pounds, or 57,000 grains, had a capacity of 230.4, or in even numbers, 231 cubic inches. This is the wine gallon now in use in the United States. The ale or beer gallon, of 282 cubic inches, was originally a measure containing 8 pounds of wheat at 204 grains to the cubic inch. The name avoirdupois was transferred at a very early date from the heavy goods, which it indicated, to the system by which they were weighed. It occurs first in the statutes of 1335 and 1353. The early pound of 15 ounces of 450 grains each (6,750 granis) was raised by law, as has been shown, to 7,200 grains, making 16 of the old ounces. In practice, however, the pound seems to have fallen below the standard to about 7,000 grains, and this weight was finally declared to be a pound avoirdupois, the avoirdupois ounce, or sixteenth of the pound, being thus reduced to $437\frac{1}{2}$ grains.

COMMON SENSE IN WINTER.

SOME OF THE FRUITFUL CAUSES OF COUGHS, COLDS, CHILLS, AND THE LIKE.

It requires a good deal of intelligence and care to avoid sickness arising from sudden variations of temperature. Unless great care is taken to keep the body at something like an even temperature, mischief is very apt to result, and a good deal of it comes from the injudicious use of outer clothing. Some have prejudices against overshoes, especially rubbers, and yet in slushy days nothing but rubbers will keep the feet dry. Others get into trouble by being too indolent to remove their rubbers in-doors, so that their feet perspire, and subsequently become chilled. The common-sense rule is to wear rubbers when they are needed, and not to begrudge the time and trouble necessary to take them off when they are not needed. Overcoats and wraps, while conducive to comfort and health, are also the cause of much illness arising from perspiration and chills. The sensible course is to have garments suitable to various degrees of temperature, and to be careful to wear them at suitable times. One who has much walking to do needs less clothing than one who rides. A skater has no need of a big ulster to keep him warm; but if he is going sleighing he can hardly get buffalo robes enough. Shovelling snow is hot work in the coldest weather. People do themselves much harm by wearing heavy outer garments in the house. Men are too lazy to take off their overcoats, and women, for various reasons, keep on their furs in church or theatre. The result is that when they go out they get chilled, and start on the high road to bronchitis or pneumonia. Too much care cannot be taken to accommodate the clothing to the temperature—to take off outer clothing at once upon entering the house, unless the house happens to be as cold as out-of-doors. The changes of temperature are so sudden that both comfort and health are promoted by the possession and use of garments of various thicknesses as they may be required. There are warm days

in winter when the heaviest winter clothing is not only uncomfortable but unhealthy, because of the danger of excessive perspiration and subsequent chills. Outer garments should be made so as to be easily removed. Ladies have heretofore experienced much inconvenience from overheating in furs and heavy wraps at the beginning and end of the season, but fashion has lately come to the rescue with short coats and capes for the milder wintry weather. Reefing jackets have performed similar service for men. Many persons suffer inconvenience and illness from wearing too heavy underclothing. The safer course is to put on extra clothing from the outside, so that it may be readily removed as occasion requires. A good deal of sickness comes in the winter from injudicious dressing for social events. Both men and women put on evening costumes which are less warm than those they habitually wear during the day. Then they fail to make up the difference in their outside wraps, and when they emerge from heated rooms after an evening's dancing, they have laid the foundation for all sorts of pulmonary troubles. Medical men agree almost unanimously that in this climate flannel underwear is almost absolutely essential to health. Those who wear it daily should change it at night. It is better to wear just enough clothing to keep the body comfortably warm under all circumstances, and to spare no pains to adjust the clothing to the circumstances with promptness. There is an old proverb that a man who sits with his back to a draught sits with his face to the grave. Any one who is in a perspiring state and sits in a draught in that state may be certain to pay the penalty in a very short time in pains and aches. Unless carefully used, heavy outer garments will be responsible for much sickness.—*Sun.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, geese.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

RICE SOUP.—When you boil a fowl save two quarts of the water in which it is cooked; put it over the fire with a small teacup of rice, half an onion cut in two and a stalk or two of celery; simmer slowly for two hours; strain and mash the rice through a sieve; return to the fire; season with salt and pepper, add one quart of milk or one pint milk and one of cream, and a tablespoonful of butter; boil up once and serve.

A DUTCH RECIPE FOR CABBAGE.—Quarter a head of cabbage and remove the stalk, cut the cabbage in very fine strips, sprinkle plentifully with salt and half a cup of vinegar, let it stand while you cut into dices a scant half pound of bacon, fry it to a crisp, then take out the bacon and add the cabbage to the hot fat; add half a cup of soup or gravy, cover and let it cook slowly for an hour, then add a wine-glass of claret, a teaspoonful of sugar and a pinch of caraway seed; dredge with flour, simmer ten minutes and serve.

BROILED YARMOUTH BLOATERS.—Split them down the back, remove the backbone and the head, broil about three minutes, pour over them some melted butter in which is squeezed some lemon juice, and serve at once.

SANDWICHES FOR AFTERNOON TEA.—Chop up very fine the meat of a roast chicken and the same amount of boiled tongue, put them in a mortar with a lump of butter and pound to a paste, adding seasoning of salt, pepper, cayenne, mace, nutmeg, and a little grated lemon peel; cut your bread very thin, butter it, spread with the mixture, put two pieces together, cut off the crust, cut the slice in two, pile on a plate daintily and serve.

RICE MUFFINS.—Mix and sift together three cups of flour, three teaspoonfuls of baking powder, one teaspoonful of salt. Beat thoroughly two or three eggs and to them add two cups of milk and pour it into the flour; melt three teaspoonfuls of butter and mix it into a cup of boiled rice; add this to the other ingredients, beat thoroughly and bake in patty pans or muffin rings.

SWEETBREAD PIE.—Soak, blanch, and cut into three pieces each, two or three sweetbreads, cook for fifteen minutes in stock with a can of mushrooms; make a few forcemeat balls and put them in a dish with the mushrooms and sweetbreads, add some hard boiled eggs and the tips of some asparagus; thicken the gravy; season, pour it over the things in the dish, lay a few thin slices of bacon on top of all, cover with a good crust and bake in a moderate oven.

FRENCH LOAF CAKE.—Two and one-quarter cups of sugar, five cups of flour, one cup of milk, three eggs, a wine-glass of brandy, two nutmegs, two and a half teaspoonfuls baking powder, one-half pound raisins, one-quarter pound citron. Sift the baking powder with the flour, beat butter and sugar to a cream, add part of the flour, and the milk a little warm, then the beaten yolks, the remainder of the flour with the whites well beaten; spice, brandy, and fruit.

COCOANUT DROPS.—One pound powdered sugar, a scant half pound flour, one pound cocoanut, and the whites of six eggs well beaten; bake in a quick oven.

GREENBACKS.

HOW THEY ARE DESIGNED AND MANUFACTURED.

On the wide-stretching plane over which the Washington monument casts its slim shadow when the sun is setting, stands a tall brick building, made conspicuous by a still taller tower and a waving flag. All day long, says the *Washington Post*, a chimney belches forth black smoke that drifts out upon the Potomac, and a noisy steam-pipe sends forth a cloud of white vapor in regular respirations. At eight o'clock in the morning nearly one thousand persons pass under its arched doorway, and at five o'clock they emerge again, like bees from a hive. In the mean time they make money, make it in a purely matter-of-fact way, as a weaver weaves carpets, or a cobbler mends shoes for a daily living. They exist in an atmosphere of wealth. Great stacks of money, that are a sight for poverty-stricken eyes, stand around them. The poorest girl in the bureau of engraving and printing handles enough money every day to make her rich for life. It is an interesting sight to see how the Government turns out day by day tons and tons of crisp new bank notes or silver certificates; to watch the silent engravers etching the steel; the shirt-sleeved plate-printers take the impressions; and the careful messengers carry off the finished bills by the cartload. So interesting, indeed, is this work of money-making that the bureau began to be overrun by visitors who seriously interfered with its work. Now, visitors are only admitted between 10 A. M. and 2 P. M. on Saturdays, and during these hours nearly every stranger in the city presents himself at the arched door, and, under the leadership of a pretty girl guide, sees how Uncle Sam replenishes his cash. When Congress has ordered the issue of a new series of notes, the first step in the bureau is the preparation of what is known as the model. This is generally a handsome pen-and-ink drawing of the proposed bill, and is submitted finally to the Secretary of the Treasury for his approval. Nothing about the note is left to mere chance. The banker does not regard money from a purely artistic standpoint. He wants the denomination to be plain and distinct, and he asks that the figure of the note be placed in the upper right hand corner in order to facilitate counting. The fact that a note must bear a certain title rather restricts the artist in preparation of the model, but very frequently, as in the case of the new twenty-dollar silver certificate, which bears the portrait of the late Secretary Manning, both utility and artistic beauty are combined. In this particular bill the artist has made a striking innovation. The portrait, instead of being at one end of the note, is in the centre, and is supported on the sides by figures of Prosperity and Labor. The lettering is at the extremities of the certificates, and the effect produced by this new idea is really very striking. The model having been adopted, the next step is the engraving of the plate. The room in which this work is done is a large well-lighted apartment on the ground floor. It must not be supposed for an instant that the entire face of a note is engraved by one man. The portrait goes to one, the vignette to another, the lettering, script and border to others, and so on, until no less than twelve men are at work. It is a long and tedious task, requiring great care and accurate skill. No less than six weeks' time is necessary for the engraving of a portrait like that of Secretary Manning. The steel used is all imported from England, and is a remarkably fine grade. Engravers all over the world use English steel and have done so for a century. Steel of equal quality could be made in America, but the demand would not be sufficient to recompense for the cost of the plant. Even the engraving tools are imported, being manufactured by a Parisian firm, which for many years had a monopoly of the business. When at the end of many months of careful engraving the various portions of the note are finished, an impression of each section is taken upon a solid plate of steel. Each separate part is placed in the position it would occupy on the note, and when the transfer is finally accomplished, the face of the new bill appears in perfect form. The plate is hardened, and across its engraved surface is passed a soft steel roller. The depressions of the plate appear on the roller as a raised surface, and when the little cylinder has been hardened it is a perfect die. It, in turn, is rolled by tremendous pressure upon a plate of soft steel. The power exerted to force the fine lines of the die into the steel is so great that a thin bit of paper placed in the plate leaves a deep impression, and a bit of lint, scarcely visible to the naked eye, forms a rough scar. A fly speck under this pressure makes a deep hole in the metal, and particles of dust must be carefully removed, lest they, too, might leave their imprint. This transfer process not only allows any number of plates to be made, but is an excellent guard against counterfeiting. Each face and each reverse of a note, being taken from the same die, are exactly alike. In no other way could this result be reached. No engraver, be he ever so careful, could reproduce, without the variation of a hair's-breadth, any work of his brands. Four impressions of the die are then made upon a plate, so that the faces or backs of four notes are always printed at the same time. The plate, after being hardened, is finished. It costs the Government, from its inception to its completion, between $1,500 and $2,000 in actual outlay for labor expended upon it. This does not, of of course, include the expensive plant which is already owned by the Government, including one lathe for geometrical scroll work that alone cost $85,000. For national bank notes the same die is continually used, the only fresh engraving being the name of the bank.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. MCGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

SEA-GOING FOR INVALIDS.

MERITS OF STEAM AND SAILING VESSELS FROM A SANITARY STANDPOINT.

A correspondent of the London *Lancet* writes: "I am glad to see in the *Lancet* an article saying so much in favor of sea voyages, but I think you have omitted one very important point, viz., the very great advantages of a sailing ship over a steamship, such as the greater cleanliness, freedom from smoke, and especially the freedom from the most unpleasant oily smell of the engines, also the greater size of the cabins. I speak from experience of a voyage to Australia and back in sailing ships, from which I derived much benefit. I was lately in a steamship and was greatly surprised at the difference; go where I would on the ship I could never escape from the oily smell of the engines. The food on the sailing ship was very good indeed." Exigencies of space forbade a comparison of the merits of sailing vessels and steamships in the article to which the correspondent refers. The point is, however, worthy of attention, and the advantages of a sailing vessel enumerated above are real and important. A sailing vessel is usually cleaner, quieter and roomier (in proportion to the number of passengers) than a steamer, and on a long sea voyage the importance of cleanliness, quiet and space can hardly be overestimated. If no other consideration had weight it would not be difficult to lay down the rule that for invalids a sailing vessel should always be preferred to a steamer. But the question is more complicated than our correspondent's letter would seem to indicate. A sailing vessel is open to the objections that the voyage is sometimes very prolonged and monotonous—that the detention in the hot and moisture-laden atmosphere of the belt of calms may extend to a week or a fortnight and is a very trying time, and that few or no opportunities are afforded for touching at ports to obtain fresh vegetables, fruits, etc. Some animals, such as pigs and ducks, thrive well at

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.

Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

sea, and their flesh remains agreeable and nutritious, but sheep and bullocks, not to mention chickens, turkeys, etc., nearly always show more or less deterioration in the quality of their meat after a few weeks at sea. Steamships with their ice chambers can surmount this disadvantage, but it is generally more or less felt on sailing ships, above all if the voyage is very prolonged. There is another point that must be kept in view in considering this question, viz., that steamships are more and more driving sailing ships out of the trade, and that the choice among the former is very much wider than among the latter. We mention these facts in order that the pros and cons of the case may be kept before our readers, but we by no means wish to imply that steamships should generally, and as a matter of routine, have a preference over sailing vessels. Much will turn upon the patient's malady, and upon his general constitutional state and usual mode of life. For serious cases (when such can be prudently sent to sea at all) a sailing vessel, always provided that reasonable comfort can be assured, will generally be preferable. Life on a steamship is too much like life in a hotel to suit such cases. Again, if the patient be specially desirous of rest and quiet a sailing vessel will best meet the case. On the other hand, if the case be one mainly requiring change and travel, if the patient likes company and must have variety and amusement, and if he cannot be content without a very liberal and constantly varied dietary, then a first-class steamship will probably please him best. Some patients, again, want "to see the world," and take great delight in the various calls made at different ports. Such persons must remember that sailing vessels hardly call anywhere, and very commonly make the long voyage to the antipodes in a single run. Probably a well-appointed yacht affords the best type of what is most desirable for travelers by sea, and while such is only at the disposal of a very limited number of patients, it is possible that "invalid ships," which are now becoming a recognized institution, may be gradually approximated in some degree to this type.

LITERARY ANNOUNCEMENT.

Among the features of *The Forum* for this year will be: "Results of the Census," a series of articles by Gen. Francis A. Walker; results of the latest research and of the most recent achievments in all important lines of work, in science and industry, by specialists; for examples, Dr. Austin Flint will write on "Dr. Koch's Discovery;" Dr. Richard Gatling on the "Development of Fire-Arms;" Frank H. Cushing on "The Hemenway Expedition;" Gaston Tissandier, the French scientist, "Dirigeable Balloons;" Prof. Emile de Laveleye on "The Partition of Africa," and so on; political discussions by the leaders of opinions of both parties in the United States, and by foreign statesmen; "Shibboleths of the Time," a series of critical examinations of popular opinions, by W. S. Lilly, the British essayist; autobiographical essays, a series to which some of the most noted men of the time, American and British, have contributed; discussions of social and religious problems in the United States; and literary articles, discussing the tendencies of literary work along all directions of activity, by the foremost critical writers.

P. E. Arline
At Home
January 1st to December 31st

Makes home cleaner, brighter and better. Cleaner—because it takes away what soap and other things leave. Brighter—because it does away with labor and hard work. Better—because it saves wear and tear on everything it touches, and nothing can be hurt by it.

Pearline "receives" every day. It gets blessing from millions of old friends—pleasant calls from a host of new ones. The best families welcome it. It goes everywhere. But it's "a stayer." When it once makes a call upon you, it stays forever—and you're glad to have it.

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.* 245 JAMES PYLE, New York.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles. sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Dec. 29, 1890.

The following are the market prices to-day at New York.

	New York.
Fancy Hay	65c. @
No. 1	60 @
No. 2	55 @
No. 3	50 @
Shipping	45 @
Clover mixed	50 @ 55
Clover	40 @ 45
Prime Rye Straw	90 @
No. 2 "	75 @ 80
Oat and Wheat	45 @ 50

Receipts week ending Dec. 27, as follows:
Via N. Y. Central, 210 cars.
" West Shore, 122 "
Total, 332 cars.
From other roads by Lighter to 34th Street, 40 cars.

Receipts of hay for the past week have been heavier than for some time, and the customary dullness of trade during the holiday season, together with the recent snowstorm, has caused an accumulation of stock on hand, and although prices are not materially changed, except on Prime Hay, they are very weak and a downward tendency may be expected should the arrivals continue as they have of late.

We think, in all probability, after January 1st, the trade will be more lively and possibly the prices may advance to some extent.

Rye Straw firm and in good demand.

GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens,** in **Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

All New Subscriptions sent now will be good until January, 1892.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

SHALL WE MAKE PURE BEER?

The bill introduced into Congress last session, and discussed by the AMERICAN ANALYST at the time, to impose a special tax upon and to regulate the manufacture, sale, and importation of adulterated malt liquors, is again before the Ways and Means Committee of the House, and the maltsters on one side and the brewers on the other are preparing for a vigorous contest over it. This bill should be of sentimental interest, at least to all drinkers of beer. It provides, in effect, that beer which may contain any other ingredient than barley malt, hops, water, and yeast, shall be sold in stamped packages, to indicate that it is not made of these ingredients. The contention of those who favor the bill is that beer cannot be pure which contains anything except these articles. On the other hand, the brewers are quite as positive in asserting that beer need not be made solely of these articles in order to be both agreeable and wholesome. It happens that if beer were to be made solely of these ingredients it could not be put upon the market at the price at which it is now sold. The question for Congress to decide is whether the use of other articles in the manufacture of beer makes the drink injurious, and, if so, whether restraint should be put upon the brewers to compel them to make a pure malt liquor. In the discussions during the last session the opponents of the bill, including the various associations of brewers, confessed frankly that in the beer in common use glucose, corn, rice, and starch were freely used. They alleged that all of these substances were harmless and that the product of manufacture was generally satisfactory to the public, and that it could not be changed by the brewers without great inconvenience, and without producing a different character and quality of beer. On the other side, it was urged that, at best, these foreign substances were adulterants, and a good deal of testimony was offered to show that they rendered beer unwholesome and poisonous. Almost everybody who drinks beer is aware that there are extensive importations of beer into this country from Germany every year, and that the imported beer sells at a price much higher than the domestic article. The reason for this is to be found perhaps in part in the taste of those who drink beer, for the use of beer appears to admit of gradations of taste much in the same way as the use of tobacco. Many drinkers no doubt prefer the German beer because of the peculiar flavor of water used in different breweries in that country. Similar preferences exist in regard to various makes of beer in the United States. There are many persons, however, who drink German beer because they are assured that it is made only of pure malt, and because they believe that the introduction of any other substance is unwholesome. Indeed, the German law-makers appear to be of that opinion also, and in various States of the German confederation the laws upon this subject are stringent. These are matters of fact, and the brewers do not attempt to dispute them. They do insist, however, that the beer made in this country satisfies the general public taste, and that since it is made of wholesome materials there is no reason why its ingredients should be changed by law. It would make a great difference to those who raise barley and who manufacture it into malt if such a bill should become law. The combined breweries of the United States sold last year about 30,000,000 barrels of beer. It is said, and is not denied, that nine-tenths of this beer was made of other ingredients than barley malt, yeast, hops and water. If the law were compulsory in regard to the use of these ingredients, there would be an increase of expense in the manufacture of beer. Since it is doubtful if consumers would be willing to pay more than the price now regarded as the standard for a glass of beer, the brewers or their immediate customers would find their profits considerably lessened as the alternative of this situation. They cannot see that there would be any gain in such a change of conditions, and they oppose a change, for this reason among others. The advocates of the bill are quite certain, however, that if a distinction could be made by law between pure malt beer and beer that was otherwise manufactured, public patronage would soon be extended to malt beer, and that in the course of time the majority of brewers would be forced, as a matter of business policy, into its manufacture.

THE ELECTRIC MOTOR OF THE FUTURE.

Mr. A. H. Chadbourne contributes to the New York *Electrical Review* some interesting views on the question of the future of electric traction. While referring to the fact that every electric street car line in this country that has been equipped and operated commercially has been a successful and a profitable investment, he dwells on the comparatively limited development of the mechanical as compared with the electrical details of the electric street car, and points to the higher degree of economy that will be attained by the electric motor, in which respect it is destined to be superior to all other systems, when its construction is carried out more in accordance with the best mechanical knowledge of the present day. The special directions in which the future progress of electric traction will assert itself, Mr. Chadbourne thinks, will be, first, the use of a longer car, with one end devoted to the motor. The cars may have at least six wheels, and will ride easily and smoothly, and round any curve with ease, as the weight will be fairly distributed on the rails, and the forward truck will be movable. The motor will be in a dry and warm room, and the motor man will have a close, direct, unhampered supervision of his machine at all times. The natural result of this will be a material reduction in depreciation, as well as a reduction to a minimum of the cost of operation. Signs are already at hand that motors of slow speed will be used, and that noiseless gears will replace the clattering and cumbersome gears of to-day. Improved devices will allow the armature to run free when the car is at rest, gearing will be dispensed with, and the armature will be placed directly about the car axle. When this is done, and Mr. Chadbourne is of opinion that it will be accomplished before another decade, "the steam locomotive must give away to advanced ideas, and we shall run through our streets and over the country at any desired speed, without smoke, cinders or fire, and travel will then indeed be a luxury."

OLEOMARGARINE TRIUMPHANT.

Everything comes to him that waiteth for the right thing to happen. Now the oleomargarine interest is likely to have an innings, a United States Court having decided that its interstate transportation is a legitimate commercial traffic. In Philadelphia, on December 24, in the case of the Commonwealth against George Paul, the Philadelphia agent of Braun & Fitts, of Chicago, manufacturers of oleomargarine, as to whom a special verdict by agreement of counsel was rendered for selling oleomargarine, Judge Reed delivered a decision, in which he holds that the State law forbidding the sale of oleomargarine in the packages as originally imported from

another State is unconstitutional. Judge Reed, after an extended opinion, sums up his conclusions as follows: First—The right of State to enact police laws—at least, when such laws prohibit the sale of articles which, without prohibition, would be legitimate subjects of commercial interchange—is subordinate to the power of the United States to regulate commerce between the States. Second—The right to sell in the original package goods imported from another State, if the latter are merchantable and legitimate subjects of trade and commerce, is guaranteed by the United States, and, though it can be regulated, it cannot be prohibited by any State. Third—The United States has the paramount right to declare what goods are merchantable and what regulations of their sale are reasonable. Fourth—By an act of Congress the United States has declared oleomargarine to be a merchantable article and has regulated its sale. Fifth—The Act of Assembly of Pennsylvania of May 21, 1885, does not regulate, but prohibits the sale of oleomargarine; therefore, such act cannot apply to the goods described in the special verdict, and the defendant is not guilty as he stands indicted.

CHAMPAGNE FROM RUSSIA.

A wine dealer of Odessa has conceived the idea of manufacturing champagne out of Caucasian, Bessarabian and Crimean grapes. He put himself into communication with manufacturers of that article in Champagne, France, and succeeded in interesting in his undertaking some of the wealthiest among them. A careful trial was made of the Russian grapes, and it was found that they would yield the finest qualities of champagne. Accordingly a company of French wine producers has been formed, a large factory with all the necessary machinery for the producing and bottling of champagne has been built in Odessa, and experts have been engaged. The whole outfit of the factory was imported from Champagne, France; even the first million of bottles were ordered from there. But if it will be found that bottles strong enough can be made in Russia, a special glass factory will be built in Odessa to supply the requirements of the new company.

HOLIDAY TOYS.

WHAT THEY MAKE IN FRANCE AND HOW THEY MAKE THEM.

One of the largest toy dealers in Paris is named Raymond. An American visitor, shortly before Christmas, inquired of him whether there was anything specially new in his line of trade. "Oh, yes," he answered, taking up a doll from the counter, "there is always something new springing up in toydom, especially at this Christmas season of the year. Here, for instance, is one of our latest novelties; it is the talking doll, which Mr. Edison, your great inventor, has recently introduced. Its linguistic accomplishments surpass those of our ordinary dolls, whose vocabulary is limited to the words 'papa' and 'mamma.' How it works? Well, you see, each puppet contains a concealed phonograph that reproduces as many as thirty words, which have been recorded upon a narrow metal cylinder. This wheel is revolved by means of a spring, and the sounds are delivered by the usual method, the mouth-piece being hidden under the clothing of the doll, just below the neck. The effects produced are fairly satisfactory, but the illusion would be more complete if the apparatus were applied to stuffed parrots, for there is a marked tendency to a croak in the tone of the phonograph. It is, however, too expensive an article to find ready buyers in every household. Speaking of dolls, have you noticed the great change that has come over our French dolls within the last few years? For a long time the English taste was better than ours. An English doll is always an imitation of a child, while ours was the counterfeit of a very much over-dressed and ultra-fashionable young lady. Our object was to give the budding mind a toy which would serve as a model of fashion; but this was a mistake, as the doll was often nothing else than merely out-of-date samples of the follies of grown-up people. That series of dolls you see there in the window, fat and chubby little creatures in their chemisettes, took the prize at the show last year on the Champ de Mars; they are known as the bébés parlants, or speaking babies, and are both articulating and unbreakable. Then, again, they are French, the work of French hands, and this to-day is a great point with purchasers. The public will no longer buy those stiff, staring, ungraceful dolls with white leather or salmon-colored bodies, tightly stuffed with bran or hay; they are all of German make, come from Nuremberg, and are as 'dull' as they can be. Nobody wants them. Some years ago all the dolls' heads in hollow porcelain, with or without real hair, came from beyond the Rhine. Many French manufacturers of cheap earthenware have since the war gone into this branch of trade, and turn out charmingly pretty heads, which are a great improvement on the old Prussian trash, which delighted our mothers and grandmothers in their juvenile years. Sculptors of acknowledged merit are not ashamed to furnish models of poupées à têtes ceramiques, or dolls with porcelain heads, the best class of which have, in leaving the potters' hands, no skull. This want is supplied by the insertion of a cork, to which a wig is attached. The work-girls employed in the manufacture of these dolls earn a good livelihood. They get on an average three francs, or sixty cents a day, which is considered fair wages for a woman in Paris. One of the most noted manufacturers of French dolls is M. Jumeau, who opened his factory in Montreuil in 1878 and now turns out 500 bébés in a day, or upward of 180,000 in a year. He employs a thousand hands, and not only supplies to a large extent the French and European markets, but exports his wares to China, Australia, Java and New Zealand. The dolls' clothes are the work of milliners and doll makers. The sizes of our dolls being all numbered, and their shoes, clothes and hats numbered to correspond, the little girl who requires a new doll's mantle or pair of shoes has only to go to the toy shop and state the number of her doll to obtain something exactly fitting it. Our great quarrel with Germany for some time past arose less from the loss of Alsace and Lorraine than on account of the playthings that are sold in Paris. That a child's toy should be made a bone of contention between two powerful nations may not at first sight seem clear. But when I tell you that, until quite recently, large quantities of the cheap toys sold in France were manufactured in Prussia, you will at once understand the cause of our dispute. Why not undersell the importers of these wares? Well, that is exactly what we were aiming at and what we have done. Nuremberg was formerly the great storehouse for toys. French industry nowadays has cut Nuremburg clean out of the market, and even Mannheim has been superseded. The wood and bone carvings of Saint Claude, in the department of the Jura, have in part helped to nonplus the latter. We do not object to English toys, for there are no better and cheaper rocking-horses, toy engines and steamboats than those from over the channel. A large industry developed in England also is the manufacture of india-rubber toys. 'Old England' has opened within the last three years a large shop on the boulevards, where at Christmas a genuine English display is to be seen. The English productions are, however, almost wholly confined to a few special types of goods. England excels not only in the articles I have just mentioned, but in balls of every kind and in painted wooden marionettes, to say nothing of the instruments required for her national games. A hundred years ago, when tennis was still the favorite pastime of French noblemen, a racquet, to be good must have borne the mark of Blois upon it; to-day such a thing as a French-made racquet is not to be found; and though croquet was adopted here as soon as it was discarded in England, we are still obliged to get all our croquet boxes from over the channel. We, however, surpass England and every other country in the making of dolls and dolls' dresses, in fashioning animals out of cardboard, and in all mechanical toys; that is, toys which are worked by some simple contrivance other than steam. Our kitchens, grocery stores, stables, forts, bedroom arrangements, on a small scale for boys and girls, are another specialty. The dolls are sometimes placed in a sort of tableau arrangement, every part of which is minutely perfect. For instance, here is a drawing-room in which the mimic upholstery is of the richest description; the toy ladies are supposed to be drinking coffee from a diminutive set of real Sevres porcelain; the clock upon the mantle shelf has a tiny mechanism that makes it go; and the piano-forte, small as it appears, is no dumb show when the keys are touched. Toy boats, which in their construction go through a dozen different hands, are very cheap, though the whole of the work is done by hand. In one Paris manufactory out in the Marais quarter, where most of the Paris toys are made, as many as ten thousand sailing boats are turned out every year. Each country, no doubt, has its own specialty in the fabrication of playthings; so that all Europe, in a way, must be laid under contribution to stock a good toy shop. Until quite recently the best leaden soldiers came from Saxony, the best humming-tops from Holland; northern Italy makes squeaking Punches and drumming rabbits, while Switzerland and Southern Tyrol have a practical monopoly of animals carved out of wood. The manufacture of these latter toys may be considered a monopoly of the flourishing little village of St. Ulrich in Southern Tyrol. I have been there. It is the great storehouse from which the chief toy traders draw their inexhaustible supplies. The art is said to have been introduced into the valley about the beginning of the last century. As soon as the boys and girls can handle a knife they begin to carve the form of some animal or toy which is the peculiar line of the family. This is one of the odd facts in connection with the trade. Each family has its own special line, from which it does not swerve. Some carve, some paint, some gild. The painters often work only in one particular color. They use no models, and work entirely by rule of thumb. Long practice enables them to turn out the tiny objects, every one as much alike as if it had been cast in a mould. Some will cut out lions, tigers, camels and elephants; others sheep, oxen and deer; others, again, chiefly birds; while another family will produce the queerly-dressed men and women popularly supposed to represent Noah and his seven human companions. There are several warehouses where the articles thus made are sold; but there are two leading merchants who act as wholesale exporters, buying the carved work either from the people themselves or from minor agents, who realize a small profit by acting as middle-men. It is the funniest place I have ever seen. Here all the numerous toys of that class mostly spring into being. Noah's arks, armies of wooden soldiers, on horseback and on foot, farmyards of every size, dolls' furniture of every shape, sets of teacups and saucers, and and all kinds of domestic utensils; little wooden horses, little wooden carts, etc. The trees from which the things are made are a soft pine, very easily worked. They grow in abundance in the district. So cheaply are these toys made that animals about five inches in height, and very artistically if roughly carved, are now sold in Paris at a cent apiece. Of course we cannot compete with a market like this, nor shall we ever attempt to do so. A large number of our cheap toys are, however, manufactured in French prisons, and nearly all those sold in the public bazaars are from this source. One of our most useful toys this year comes from America. It is the Anchor Stone building box. But our children have long since enjoyed similar articles. We have, for instance, the geographical model and the box of architectural solids. The latter is a great improvement upon the boxes of common wooden bricks usually sold, as it

includes a great variety of other forms required by youngsters in their amateur building operations. Parents also do well in obtaining the geometrical and drawing solids and mechanical models. Toys should be educational. Not that a child should look upon his play as a lesson, or it will altogether cease to be play. Certain toys, if well selected, will impart a vast amount of instruction without any mental strain. Give a tot five or six years old a box of these constructive blocks, and he will puzzle over it for days, try every sort of arrangement, and unwittingly acquire some important mechanical methods. What is true of the box of bricks is also true of a number of other toys. Of these I may mention magnetic fish, hydrostatic toys with water wells and fountains, the kaleidoscope, the magnetic wheel, and many more. All these involve scientific laws which a child may understand with little difficulty. A genuine bona fide cooking stove is an excellent toy to put into the hands of a young girl. Pretending to cook is largely played at by children of all countries. These stoves, though on a small scale, are made large enough to be capable of dressing a small dinner. By a course of instructions in play-cooking, or by simply imitating the more serious work of the 'cordon bleu,' a most useful game may be introduced into many households. India rubber balls are now in a measure replaced by an article manufactured out of celimose, which bounds beautifully and is sold dirt-cheap. The navigable balloon, which doesn't navigate at all, with its model aeronauts, the orchestrion and the torpedo boat, are still favorites. Punch, of course, still reigns supreme in the innocent hearts of little monsieur and mamselle. He is aged, he is hideous, with long, hooked nose, and deeply furrowed visage. He wears a grotesque costume, made up of many-colored patches. His legs are twisted, and he has a formidable hump on his back, while his breast bone protrudes in most ungainly fashion. Yet our French children delight in his deformity, and every boy and girl you meet hugs Punchinello in a close embrace. Then there is the 'bossu guéri'—the hunchback cured. This is a great favorite among the people. It represents a doctor in cocked hat and scarlet coat, armed with a carpenter's plane, hard at work planing down his patient's hump. The work begins, the patient, laid upon the carpenter's bench, utters a plaintive squeak each time the tool is placed over his deformity, at which the children go into a fit of laughter. Politics are finding their way into this season's toys. The crushing defeat of the Boulangists has brought out again a brass gimcrack entitled 'What has become of him?' Him, of course, is the general. He stands in full military uniform by the side of a large soup tureen, which he contemplates with a chop-fallen countenance. Soon as the question which gives its name to the toy is put, you touch a spring in the handle, when France's whilom hero topples over and plunges head-foremost into a huge piece of porcelain ware. Boulanger's partizans retaliate with a mechanical toy too expensive to be sold by the hawkers. It is a long, thin, blond figure of a whiskered lawyer, dressed in the black gown of a magistrate, with spectacles on his nose and a glass of water on the desk before him. This is the redoubtable M. Quesnay de Beaurepaire, the general advocate who took such a leading part in the prosecution of the general before the high court of justice. He is represented in the act of reading the famous indictment which brought about the condemnation and sudden departure of the former friend of the Duchesse d'Uzes."

GLYCERINE.

ITS CHARACTER, DERIVATION AND CHEMICAL COMPOSITION.

Many years ago, in an obscure mining village in Sweden, the apothecary, while making lead plaster in the ordinary way by heating olive oil with litharge and water, chanced to notice that the liquid which was mingled with the pasty lead compound had a strangely sweet taste. On further investigation he found that the sweet taste was caused by the presence of an oily liquid which was dissolved in the water. No such substance was described in the books of the day. Evidently a discovery had been made. The discoverer, although poor and with slight advantages of education, was a man of more than ordinary ability. Already he had attracted the attention of the learned men of the day by publishing his quaint chemical theories of combustion (*Ueber die Luft und das Feuer*); nor was this his first discovery of a substance hitherto unknown to science. We can easily imagine, then, with what enthusiasm Scheele—for that was his name—plunged into the study of the strange liquid in the occasional respite that was granted him from the pestle and the dispensing counter. He soon found that the sweet substance was not the product of olive oil alone, but that other oils and fats would yield it under the same treatment; so he named it the "sweet principle of fats," or "oil-sugar." Soon after, his work was cut short by death. More than a century has passed since Scheele's discovery yet it is scarcely fifty years since "oil-sugar" was found to be of practical value, except, perhaps, for a limited use in medicine. Many famous chemists had taught the world much as to its nature and production, had given it the more formal name of glycerine, derived from a Greek word meaning sweet, but to the every-day world the substance remained only a curiosity. Nowadays, every one is familiar with the clear, thick liquid so commonly used for toilet purposes. Its soothing and softening effect on dry or inflamed skin is the quality by which it is best known in most households; but few people have any idea of the variety of purposes for which glycerine is used. This will not seem strange when we find how many valuable properties are possessed by this remarkable liquid. Among the most striking of these are its great solvent power, its chemical stability, and its sweetness. Besides these, it is not indigestible, will not evaporate, and, owing to this and its hygroscopic qualities, will prevent drying and hardening of materials with which it is mixed. These peculiar qualities make it most valuable in the preparation of medicines and various food-products, as preserves and mustards; likewise in beer, wines, and other bottled goods, where it is said to act as a preservative. The fact that strong solutions of glycerine and water will not freeze in the lowest winter temperatures has its use in our "wet" gas-meters. In short, the list of purposes to which this most useful liquid is put is almost exhaustless. Among the more important industries in which it is used are vulcanizing india-rubber, silvering and gilding glass, dressing leather for kid gloves, preserving anatomical and botanical specimens, and the manufacture of what is, perhaps, the most powerful explosive known to science—without whose aid some of the grandest triumphs of modern engineering would have been impossibilities—nitro-glycerine. Scientifically considered, glycerine is most interesting. Mention has already been made of many of its physical characteristics. In a pure state glycerine is somewhat more than a fourth heavier than water (1.269). After long exposure to a freezing temperature it will deposit rhombic crystals resembling those of sugar candy. Strangely enough, when quickly cooled to very low temperature—40 deg. Fahr.— it forms a gummy mass which will not harden nor crystallize. Indeed, it was not till 1867 that it was thought possible to crystallize it. The boiling point of glycerine is about 490 degrees Fahr. At this point it decomposes slightly. As already stated, glycerine will not evaporate at ordinary temperatures, but at the boiling point of water (212 degrees Fahr.) there is a perceptible loss. Pure glycerine will burn readily, if first heated to about 300 deg. Fahr., giving a pale-blue flame similar to that of alcohol. Heated intensely it decomposes into acrolein, a most pungent-smelling compound, one whiff of which is usually sufficient to fix it indelibly on the memory. To the chemist glycerine is an alcohol, being, like other alcohols, a hydrate of an "organic radical"—that is to say, the hydrate of a combination of carbon and hydrogen which forms salts as if it were a metallic element. From its chemical behavior glycerine can be considered a "tri-atomic alcohol," or tri-hydrate, with the formula $C_3H_5(OH)_3$, on the same analogy as sodic hydrate, NaOH, or calcic hydrate, $Ca(OH)_2$; the group represented by the formula C_3H_5 acting as a base and known chemically as glyceryl or propenyl. Just as we can make salts of a metal from the hydrate, so can we make salts of glyceryl in essentially the same way, although the methods employed are different. Nitro-glycerine, so-called, is one of these salts of glyceryl, being an impure tri-nitrate ($C_3H_5[NO_3]_3$). By far the most important salts of glyceryl are oils and fats. The majority of these are salts of glyceryl and organic acids. The principal of these acids, out of many which are present in our common fats, are stearic, oleic and palmitic acids. We now understand how it was that Scheele made his glycerine. We remember that olive oil was the basis of his lead plaster. This oil is, in the main, glyceryl oleate ($C_3H_5[C_{18}H_{33}O_2]_3$). Hence the reaction between the lead and the oil and water can be expressed by the following equations:

$$2\,C_3H_5(C_{18}H_{33}O_2)_3 + 3\,PbO + 3\,H_2O$$
Glyceryl oleate. Litharge. Water.

$$= 2\,C_3H_5(OH)_3 + 3Pb(C_{18}H_{33}O_2)_3$$
Glycerine. Lead oleate (lead plaster).

For many years this reaction was the basis of the manufacture of glycerine. Cheaper fats than olive oil, of course, were used, while traces of lead in solution were removed by sulphuretted hydrogen. As the use of glycerine became more extensive, there arose the necessity for a cheaper method of production. Attention naturally was directed to the spent lye of the soap manufacturer, for soaps are sodium or potassium salts, principally of stearic acid, made by a reaction similar to that used in making lead plaster, but substituting caustic alkalis for litharge. By the method of soap manufacture, however, the liquors containing the glycerine are so contaminated by alkalies and salt, and are so diluted, that until recently it has not paid to recover the glycerine. A process, which has proved most profitable, has been invented to decompose animal fat directly into stearic acid and glycerine, by subjecting it to the action of superheated steam, at a temperature of about 300 deg. Fahr. The resulting glycerine is concentrated and purified by steam distillation, while the stearic acid, which much resembles wax, and in no way answers to our ordinary conception of an acid, is in great demand for candles. In this way thousands of tons of glycerine are made yearly, not to mention the immense number of excellent candles which are also products of the process.—*Popular Science News.*

AFRICAN DIAMONDS.—Geologists have proved that the diamond mines of South Africa are situated in vents or chimneys varying from 70 to 1,500 feet in diameter.

FUNGOID AFFINITY.—It has recently been found that certain fungoid growths have the power of removing gold from water containing it in suspension.

POTATO ALCOHOL.—A French chemist has shown that the potato called the "Richter imperator" is well fitted for the production of alcohol by distillation on a commercial scale, and that the "draff" that results is readily eaten by cattle.

MILITARY TELEPHONES.—All the forts and military establishments of Belgium have been connected with Antwerp by telephone. Special precautions have been taken to prevent an enemy tapping the wires in war time. The instrument used is a Dejongh microphone

CHANGING LATITUDE.—Observations seem to show that a decrease in the earth's latitude is in progress, implying an alteration in the direction of the earth's axis. The fluctuation is thought to be due to a minute's oscillation, caused by some changes in the internal wars of the earth.

MICROBES AND LONGEVITY.

HOW LONG MAY MEN HOPE TO LIVE?

The question of the prolongation of human life is to be made to depend in great part on the success with which the individual resists the microbes that infest his body. This resistance will depend partly on the precautions taken and partly on the fact that the bacilli find the tissues of some persons more suitable as a lodgment, and sweeter as nutriment, which permits of their taking possession of them in greater numbers and more speedily accomplishing their deadly work. We have in California the San Francisco microbe, the Oakland microbe, the Berkeley microbe, which the professors of the University of California resist with tolerable success, owing to their superior wisdom, and those which flourish in the San Jose, Salinas, San Joaquin and Sacramento valleys. The microbes propagate and develop each after its kind, like the beasts of holy writ, finding an ever-increasing aliment in the rapidly augmenting population of the State. In their preference for some persons rather than others they resemble the mosquito, which lets a certain category of individuals severely alone, while in revenge for the exceptions it plunges its venomous bill with more extreme virulence and tenacity into others. Are we to infer that the microbe of the Salinas valley is less dangerous because it permits certain persons to live to the age of 150 years? If this is the case, we may yet live to see the land boomers of that favored region issue prospectuses containing such phrases as these: "Come to the Salinas valley, for here the Koch bacillus is unknown, and the microbe of Pasteur vainly attacks the human system;" or, "In this land, favored by divine Providence, the golden age, the age of the patriarchs, the age of Methuselah is not an idle dream, for here, owing to the absence of parasites, which are the universal causes of disease, death has lost its sting," etc. This is not such an idle dream as many persons think, for there are scientists who encourage the idea that when the means of successfully combating the microbes are discovered, human life will be indefinitely prolonged. Some of these wise men even believe that the tales of the long-lived patriarchs told in Bible history are not so very absurd, and that mankind, by the aid of medical science, may yet be able to repeat the same experience. Prussian statistics demonstrate that of every 100,000 male children born in that country 77 per cent. in round numbers live one year, 62 per cent. 10 years, 60 per cent. (nearly) 20 years, 54 per cent. 33 years, 48 per cent. 40 years, 40 per cent. 50 years, 30 per cent. 60 years, 17 per cent. 70 years, nearly 5 per cent. 80 years, one-third of 1 per cent. 90 years, and fifteen thousandths of 1 per cent. 100 years. The mean term of life is estimated at 35 years for the male, and 38 years for the female sex. Prussia, it should be noted, is not par excellence the country of microbes, a great part of its area being sandy barrens, as discouraging to the little animals as the plain of Mamre inhabited by the patriarchs, and the rest a series of lakes and marshes, where they may procreate to a certain extent during the brief summer, only to be inevitably killed by a long and rigorous winter. According to a German writer, the age of Methuselah, given in the Bible at 969 years, has been miscalculated. The term "years," in his estimation, should be interpreted seasons, which would reduce the period of this patriarch's existence to 240 years—which it is by no means impossible he might have attained in those days of heroic build and primitive simplicity of diet and personal habits. Allowing for all possible errors in the statistics of modern longevity, it seems to be quite within the limits of possibility that a person may live 200 years, since many are known to have passed 150. The case of Thomas Parr, the poor Shropshire peasant, who died at the age of 152 years and 9 months, is one of those most frequently mentioned. Had not the curiosity of the living caused his transportation to London, there is every reason to believe he would have lived several years longer. Parr was a very robust man. At the age of 101 he was put in the stocks for an offence against good morals. He married at 120 a widow who never realized his great age. At 130 he was still able to thresh grain with the flail—one of the most arduous of labors. At the time of his death his sight was slightly enfeebled, but his other senses were perfect. His body was dissected by Harvey, the celebrated anatomist, who found the heart and other organs in perfect condition, and no ossification of the cartilages, which is so common in old men. In 1670 a man named Jenkins died in Yorkshire, aged 169, who, at the age of 12, had fought at the battle of Flodden. Being called into court a short time before his death, to testify to an occurrence that had taken place 140 years before, he appeared accompanied by his two sons, one aged 100 and the other 102. Fishing was his favorite occupation up to the day of his death. There is quoted the case of St. Mungo, the founder of the diocese of Glasgow, who, according to the epitaph placed on the tomb, deceased at the age of 185. There are cases on record of persons dying at an age even more advanced, but the more remote they are in time the more difficult they are, naturally, of verification. The case of Methuselah is one that concerns the Jewish race, which, though more subject to physical infirmities, is longer lived than the race sometimes, though incorrectly, called Caucasian. It has been calculated at Frankfort, in Germany, where the Jews are numerous, that the mean duration of their life is 48 years, while that of the Christians about them does not quite reach 35 years. The physical peculiarities and personal habits of those who have died at an extreme old age merit attention. Owen Carollan, an Irish farmer who died at Meath in 1764, at the age of 127, had six fingers on each hand and six toes on each foot. Elspeth Walson, a Scotch woman who died at the age of 115, was a dwarf only two feet and three inches in height. In contrast with this singular case is that of Jacob Donald, a giant seven feet and two inches in height, who died near Cork at the age of 120 years. That a man may live long and work hard is illustrated by the case of Jean Maulmy of Brittany, in France, who died in 1757, aged 120. His neck was so short and his shoulders so round that when regarded from behind his head was invisible. A French woman who served seventy-two years in a menial capacity at the castle of Colemberg, in the northeast of France, was hunchbacked, a class of deformed persons that presents numerous cases of longevity. As a rule alcoholism abridges life for reasons independent of microbes. From the cases of 6111 hard drinkers, aged from 16 to 90, studied in England, it has been inferred that the mortality among the class is three times greater than among ordinary Englishmen. It is not to be inferred precisely from this fact that beer, wines and liquors used in proper quantities shorten life. Annibal Camoux, who died at Marseilles in 1760 at the age of 122, drank wine freely all his life. Grogres Kiston, who died at the age of 125, in Yorkshire, in 1764, was intemperate. Johanna Obst, who deceased in Silesia in 1825, at the age of 155 drank every day two glasses of brandy—large ones, of course. Philip Larroque, a French butcher, who lived to the age of 102, got drunk regularly twice a week. A French surgeon, Politiman, who lived in Lorraine and attained the age of 140, from 25 till his death got drunk regularly every evening. Another surgeon, who lived in the south of France, and died at 112, followed precisely the same mode of life, while the epitaph of an Irish farmer named Brawn, who attained the age of 120, records the fact that he never drew a sober breath in his life. Beer was his favorite tipple. There are similar cases of longevity among the coffee-drinkers, and yet two cups of good coffee contain one-fifth of a gramme of cafeine, a dose that a physician would not dare to exceed. Nevertheless, a woman living near Marseilles drank coffee from morning to night during a great part of her life, taking on an average forty cups a day, and yet lived to 114 years. It is recorded of other centenarians that coffee was their usual remedy for bodily ills. What is this but another phase of the relation of the nerves to vital force. It is hard to imagine microbes so hardy as to invest the body of any one whose tissues are thoroughly saturated either with alcohol or cafeine. It may be well to close with a word to smokers. A French savant who has investigated the cases of many centenarians declares that among them all he found only one addicted to the smoking habit.—*S. F. Chronicle.*

RISKS TO EYESIGHT.

A CAUTION AGAINST THE NICKEL-IN-THE-SLOT OPERA GLASSES.

Dr. F. Ogden Stout said, in the course of a conversation at the office of the Spencer Optical Manufacturing Company a few days ago: "The introduction of the drop-a-dime-in-the-slot opera glasses into the theatres has probably done more to injure the eyes of the users than any one thing. These opera glasses generally are worth about $18 per dozen, and for inferiority in finish and quality of lenses they cannot be surpassed. This, however is of not so much importance to the public as the injurious and dangerous diseases that may be taken from one user to the other. It is an acknowledged fact that a number of eye diseases may be contracted by bringing the eye in contact with towels, handkerchiefs or anything the afflicted may have used around the eyes. What, then, would be the effect, if to-night a person with such a disease uses one of these opera glasses, and a particle of the secretion adheres to the eye-piece, and to-morrow night it comes in contact with a healthy eye? Could not the infectious particle come in contact with a healthy eye as easily as it could be left by an unhealthy one? It is useless for me to answer these questions. In New York City children with eye diseases are prohibited from entering the baths for fear that the water will be contaminated and the diseases thereby conveyed to others; and although precautions are taken, scarcely a season passes without any epidemic among the great unwashed. But very few have heard of diseases caused by the use of the opera glass in the theatres. Why is this so? Because those becoming afflicted do not have a thought that an opera glass they have used is the cause. A physician will ask them if they have used towels or other articles that have been used by others with sore eyes, but he does not ask them about the use of an opera glass, and therefore the source of disease in a large number of cases is unaccounted for. One of the most serious of eye diseases that may be transmitted by a contagion is what is called by the medical profession mucopurulent conjunctivitis or catarrhal ophthalmia, a contagious inflammation of the conjunctiva or the thin membrane which covers the outer part of the eyeball and the inner side of the lids; it may be transmitted to a healthy eye by using any article that has been brought in contact with an eye so diseased. Professor Noyes, in his admirable work on the eye, says, in speaking of its cause: 'In a few instances it seems to be of spontaneous origin, but these are very rare—while in the vast majority of cases some source of contagion can be traced by communication from a similarly diseased eye by indirect contact through the fingers or handkerchiefs, towels, clothing or rags. A very minute quantity is sufficient. To show how contagious it is, he says, the mystery which sometimes attaches to the transmission of the inflammation to a healthy eye is less surprising, when it is known that the pus when diluted 1 to 1,000, still retains decided contagious properties. Drs. Fox and Gould, in their 'Compend' on the eye say, 'The chief cause is doubtless contagion. Caution about the use of towels, etc., must always be urged upon parents and those afflicted.' Trachoma or granulated lids is also an infectious disease of the eyes. Drs. Fox. and Gould say in their book on the eye that 'mal-nutrition, fatigue, bad ventilation, etc., may produce the infection spon-

taneously, but the greater number of cases arise from infection. I might go on and describe a number of diseases of the eye that are contagious, but it is unnecessary, as I have cited enough to illustrate, and those desiring a more thorough knowledge of this can be gratified by turning to any standard treatise for the diseases of the eye."

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, geese.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

SOFT CLAMS WITH SHERRY.—Use the plump part only of a dozen large soft-shelled clams. Put in a chafing-dish a pat of butter, and when quite hot add a dash of flour and cayenne to suit the taste; add the clams, and, when they are slightly cooked, add half a cup of sherry. Cover the dish and allow it to simmer five minutes: have ready three slices of toast, put four clams upon each slice, add a little of the hot sherry, and serve.

CHICKEN CUTLETS.—Skin a couple of chickens, bone the joints, all except the wings, and take out the breast-bone; flatten out the flesh, and season it highly with salt, pepper, cayenne, nutmeg and mace; dip it in beaten egg and cracker crumbs and fry a nice brown. Make a good brown gravy, and flavor it with a little grated lemon peel. Dish the cutlets and pour the gravy over them.

LEMON SAUCE FOR BOILED FOWL.—Simmer gently in two cupfuls of sweet cream the peel of a small lemon cut very thin, ten peppercorns, and a sprig of lemon thyme. When the cream tastes well of the lemon strain it, and thicken with two teaspoonfuls of flour rubbed into three of butter; boil up; pour the strained juice of the lemon in and stir well, but do not boil it again; add a little hot broth or gravy, season and serve.

FISH BALLS.—Pick very fine one cupful codfish, pare a bowlful of small potatoes and put them in a saucepan, with the fish on top of them; cover with boiling water and cook until they are done, probably about half an hour. Now drain off the water and mash the fish and potatoes together, then beat them up with a spoon until they are very light; add to them a tablespoonful of butter, a little pepper, and a well-beaten egg. Heat a kettle of fat until it is boiling; take a large spoon and put it first into the hot fat, and then take up a spoonful of the fish and drop it into the fat. Be careful not to get too many balls in the kettle at once. Cook them until they are a rich brown, and serve at once.

FIG CAKE.—Make some layers of cake with the following mixture: Three eggs, one cupful of powdered sugar, one cupful of baking powder sifted in three-quarters of a cup of flour. Beat the whites and yolks of the eggs separately, and add the whites the last thing, mixing them in lightly when the rest of the ingredients are well beaten together. Flavor with lemon and bake in jelly-cake tins. Make a filling as follows: Beat the whites of three eggs, and add to them sufficient sugar to make a good icing; chop up six fine figs, a handful of raisins and a little citron; squeeze half a lemon into this; stir the fruit into the icing and spread it on the cake layers, and put them together.

CHOCOLATE ICING.—Beat the whites of two eggs to a froth. Put six tablespoonfuls of grated chocolate, six tablespoonfuls of sugar, and a little hot water in a saucepan and heat over the fire, stirring all the time until the chocolate is smooth; take from the fire, flavor with vanilla, add the beaten whites, and it is ready to use.

BUTTER CAKES.—One quart sour milk or buttermilk, one teaspoonful baking soda, a little salt, one and a half cupfuls cold baked rice, two tablespoonfuls molasses, and flour enough to make a stiff batter; fry on a hot griddle for breakfast.

THE SHEKEL.

ITS MOST ANCIENT USE A WEIGHT AND NOT A COIN.

An evidently thoroughly informed writer in the *Journal of Commerce* discusses the question of the beginning of currency as follows:

A correspondent sends an extract from a newspaper (which I have already seen in several other papers), and asks if it is true. The statement is made that a gentleman, whose name is given, "Owns the only genuine and perfect holy shekel in the world. The relic is about 3,400 years old, and was used in Solomon's temple. There is but one other similar coin in existence, and that is in the British Museum. It is also a holy shekel, but is not so well preserved, and a portion of it has been cut away," etc., etc. Paragraphs like this, about ancient objects, are very common, and when started are tolerably sure to run through a large portion of the daily and weekly press of the country. You do not find them in European papers. This is because the people there live among the remains of older times, and have been thoroughly educated to the importance of cautious inquiry before making statements about the antiquity of any relic. This education has been aided by the many museums in which historical facts in art have been gathered. Similar museums are now growing up in America, and their educational power is already telling with no small force. But they have plenty of work yet to be done. Without doubt the possessor of the coin referred to believes what is stated of it. Possibly he does possess a genuine ancient Hebrew shekel; but it has no such antiquity as is assigned to it. There are many of these coins in public and private collections. The story might be allowed to travel without challenge, were it not that to young persons, and to adults as well, it contradicts the true history of the arts, and consequently all history; for the history of nations and people is recorded in the history of their arts. Every one ought to know the main facts in the history of coinage, an art, which is not only closely related to the commercial and domestic lives of peoples and individuals, but is also, by the permanence of legends and devices on coins, the great assistant of written history in determining dates and events. Coinage, like many of our arts was the legitimate child of older art. We know no older art than the art of writing. The most ancient men of whom we really know anything possessed the art of writing making vocal sounds visible to the eye in signs. They also possessed the art of engraving these signs on stones, with which to impress the signs on soft substances. Engraved seals are among the oldest known works of human art. But men used seals for some thousands of years (certainly more than two thousand) before the idea was suggested of engraving a die to stamp a device, like a seal stamp, on fixed weights of metal. This idea came, as so many great inventions have come, in obedience to the demand of the people for it. Inventions record the conditions of peoples, their desires and wants which the inventions supplied. For thousands of years the human race felt no need of coins. Mercantile transactions, large and small, were carried on chiefly by exchange—barter. There were always objects whose value was determined, not by considerations of utility, but by the mere desire of men to possess them. Such, for example, in ancient Greece and in Asia was lapis lazuli, the stone on which we set small price, but which then ranked as very precious. Gold and silver and other metals were prized for two considerations, utility in making elegant objects of use, beauty in ornamentation. At a very early period gold and silver had become objects of such universal demand that in any and every mercantile transaction the seller was willing to exchange his goods for these metals, or settle differences in barter by them. But neither gold nor silver was a standard of value. It is probable that the earliest standards were cattle and sheep. These were money that could travel on their own legs from one to the other party in a barter. The value of property was not first expressed by the ancients as we express it in terms of precious metals; but the value of precious metals was expressed in terms of property They did not say "that lamb is worth so much gold,' but they did say "that amount of gold is worth a lamb." In truth, then as now, the great fact which men forget, which underlies all commercial transactions, which stultifies all attempts to create metal values by legislation—the great fact was and is, that when you buy a cigar for 10 cents the merchant buys from you the silver just as you buy from him the tobacco. I have no intention of relating the long history of early commerce. There is no space for it. But it is necessary to impress on memory the principal facts in order that you may remember that coinage is not one of the earliest arts. Among the paintings in Egyptian tombs we find represented a man weighing piles of small rings, which from their color seem to be gold and silver. It has been conjectured that for convenience the precious metals were sometimes cast in rings of uniform weight. There are various reasons going to support this conjecture, one most cogent being that the weights used by the Egyptian are in the forms of lambs and half lambs. Connect this with the fact that the Latin word *pecunia* comes from *pecus*, the flock or herd; that the patriarch Jacob purchased land for a hundred "pieces of silver," the Hebrew word thus translated meaning also lambs, and containing the idea of a just weight; that Layard found at Nineveh weights shaped like lambs, and with many other facts which there is no space to cite, and you will then see the ancient relations of precious metals to buying and selling agricultural products. Like grain, gold and silver passed by weight in every purchase and sale. Possibly there were small pieces which men took on sight, but they were not stamped with any sign, and, indeed, that they ever existed is mere conjecture. It is a remarkable fact, if the Egyptians and others did use rings of precious metal, as the Theban tomb indicates, that no specimen ring has ever been found among the countless relics of that old land. Abraham bought the cave of Machpelah for shekels of silver, but these were shekels of weight, not coins. Neither Abraham nor Jacob, nor David nor Solomon ever handled or saw a coin. Precious metals passed only by weight among the Hebrews, as elsewhere, until the later invention of coinage in Iona. The Phenician commerce was revolutionizing the known world in the eighth and nineth centuries before Christ. This extension of commercial relations and increase of local and foreign business among men was probably the impelling motive of the invention of coinage. The idea of the art was and is the furnishing of pieces of metal of uniform weight and uniform fineness, on each of which is impressed the stamp of an authority whose certificate thus impressed will command confidence. The certificate meant, from the beginning, this piece of metal is gold or silver, of such or such fineness, and weighs so much. What that piece of metal was worth

in sheep, or goods, or land, always was and is left to the holder. He sells it always for what he thinks it worth. The name it goes by is a mere matter of convenience, whether it be called stater, phillip, denarius, dollar or ducat. Among the Greeks the first gold coins got the popular name of statar (standard) and long kept it. It is probable that the first coin was struck at Miletus, a city of Iona, about B. C. 800, for the uses of a mixed population of Phœnicians and Greeks. Some have thought a coin of Sardis the first. Others have thought the silver coinage of Ægina to be the leader in the long line. Whichever came first there is no doubt about the period. The new idea spread at once from city to city. The old world had more confidence than the modern in city governments. All the early coins were issues of independent cities or small states. The coins were first rude lumps of metal. One die was used. The lump of metal was driven into the die with a punch and mallet or hammer. The punch mark is a deep dent on one side, and the engraved device of the die on the other. Soon the punch end was engraved with a device, and soon after two dies came into use. The ruder engravings of the early period gave place to the beautiful work of advancing Greek art, until when Alexander conquered Asia, B. C. 332-1, he carried thither the superb gold staters of his father's and his own coinage, and silver drachms and tetradrachms of surpassing beauty. His successors in Asia continued a magnificent coinage. Meantime the Hebrews had no coins except such of foreign states as drifted among them in the ways of trade. Their religion forbade the use of most of these, bearing as they did the images of gods and men. They still used gold and silver only by weight. It was not until 140 B. C. that the first Hebrew coin, a shekel, was struck. In the first book of Maccabees, fifteenth chapter, will be found the authority given by Antiochus Sidetes to Simon the high priest, to coin money in Jerusalem. The great Simon had possibly exercised this right a few years earlier, under the broad powers conferred on him by Demetrius II. The exact year of his first shekel cannot be given, and therefore I call it about B. C. 140. It was certainly not earlier than B. C. 143, and not later than 135, when Simon was murdered. This first Hebrew shekel is a silver coin bearing on one side in the middle a vase or cup, around it in Hebrew characters SHEKEL ISRAEL, and over the cup a Hebrew letter meaning *one*. It is uncertain whether this means the first year of Simon's power in Jerusalem, or the first year of his coinage. On the reverse of the coin are three flower buds on one stem, and around it in Hebrew letters, JERUSALEM KUDOSHA—Jerusalem the holy. Half shekels with similar inscriptions were coined at the same time. Simon continued his coinage of these pieces for only three or four years, and examples are known bearing dates of the second year and the third year. A half shekel is known of the fourth year. It has been common to consider the cup or chalice on one side of this shekel of Simon Maccabeus as the pot of manna which had once been in the Ark in the temple, and the budding flowers, seen on the other side, as representing the budding rod of Aaron. There is very little on which to rest this theory. These coins of Simon Maccabeus are the coins which from time to time are spoken of as ancient Hebrew shekels, dating from the time of Solomon. The silver shekel weighs about 220 grains. Specimens are rare, but not of what numismatists call the highest rarity. Travelers in the east are frequently pressed to purchase silver shekels, which are almost invariably modern counterfeits, bearing little resemblance to the original. I have had in my collection two excellent specimens of the shekel of Simon, the great high priest, and have seen several others. I have one fine specimen of the second year of Simon lying before me as I write. There are copper coins of the time of Simon, and after his time there is a very interesting series of small copper Hebrew coins. Perhaps the most interesting of these are the issues of the Roman Procurators, and among them none are more interesting than those of Pontius Pilate. These copper coins of Jerusalem are not rare. I have gathered handfuls of them out of the earth on the slopes of Mount Moriah. Those of Pilate, dating in the years A. D. 29 and 30, are of most startling interest, when one considers what hands may have handled them. There is small hope of putting a stop to the circulation of misleading paragraphs about coins of the time of Solomon. But it seemed well that the readers of these letters should be guarded against such errors. In truth, there are lessons in the history of coinage for legislators and all who deal in financial affairs—primarily the lesson that gold and silver have been from the beginning of history mere merchandise like guano, bought and sold by weight and quality, and their intrinsic value is never more and never less than "what they will fetch" in the market.

PURE BLOOD.

The overwhelming importance of the blood in the vital economy is well exemplified in the speech of every-day life. Such expressions as "blood is thicker than water," "blood relations," "of the same blood," and "the blood turns cold," are household words, as old as the English tongue. It is difficult to realize the many offices which are filled by the blood. It is a liquid, and, like all liquids, liable to leak, but the only one which endeavors to close a leak as soon as made. It is a solvent, whose like is unknown. It carries, suspended or dissolved, starch and sugar, oil and bone, albumen and fibrin, iron, lime and salt—substances representing the vegetable, animal, and mineral kingdoms. It is a heating apparatus, similar to the hot-water pipes used in great buildings. It starts from the heart and lungs, and carries caloric to the toe-tips, keeping the body at about one temperature from birth to death, and supplying no more warmth to the farthest tissue than to the nearest. It is a fuel unspeakably fine and delicate. It carries into the lungs cells and molecules which are to be burned up, and then absorbs the air requisite to combustion. As the coal burned in a furnace produces heat, and, through the mechanism of engine and dynamo, motion, power, and electricity, so the substances burned in the blood produce heat, motion, muscular power, and mental activity. It oils the joints with synovial oil, like a careful engineer. Like a good housewife, it is perpetually cleaning every article and tissue in the body, and, like a prudent landlord, it never ceases keeping the exterior of the human framework in perfect order and repair. These are but a few of the functions performed by the blood. A list of all that it does would fill a volume. As long as health continues, it performs its work smoothly and thoroughly. This harmonious action means, above all, physiological facts, physical ease and happiness. In childhood, it implies sports and games; in manhood, exercise and toil, and in old age quiet and content. But when health departs there is always an unseen revolution within the organism. No matter through what door disease may enter, whether by germs, noxious gases and vapors, unwholesome foods or deleterious substances, by neglect, inheritance, or surroundings, the blood is no longer able to play its part properly, and pain, weakness, disability, and even death result. It no longer carries the materials with which the body is built up, or it carries them in wrong proportions, thus causing emaciation, bloating, dropsy, and kindred ills. Its heating power changes. One moment it is cold, and another over-warm; or, as we better know it, it produces first a chill and then a fever. It loses its value as a furnisher of force. The energy of life dwindles, and the body becomes weak and nerveless, the brain dull and incapable of action, and the senses untrustworthy and useless. It no longer cleans the interior and repairs the exterior of the corporeal frame. Within, impurities collect here and there, tissues become depraved, and organs lose their activity; without, eruptions disfigure the face, boils and sores the body. In some cases it loses the power to clot, so that the smallest cut becomes a sluice-gate through which it loses itself. In other cases it becomes so surcharged with foreign matter as to discolor the skin and change the hues of health into dingy grays, browns, and yellows. It may be truthfully said that the blood is the seat of all health. The reverse is almost as true, that disease arises from an impure blood. What shall be done, then, to keep the blood pure at all times, and to make it so when, from any cause, it has become defiled with humors? The answer is simple and easy. Use the remedies which nature has provided for the purpose. Assist the functions by using fresh air, sunlight, and exercise, by warm bathing and right living. Then take the medicinal substances of the organic and inorganic kingdoms which eradicate all impurities of the system. Of these the best are podophyllin, yellow dock, stillingia, sarsaparilla, and the iodides. These are recommended by every physician and scientist. They are good separately, but they only achieve their best results when combined as they are in Ayer's Sarsaparilla. This is no secret remedy, but merely a scientific compound of the ingredients named, whose formula is published to the world. It can and should be used by everybody, and when used it is certain to keep the blood pure, and make health and strength the rule of life.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Relieves Indigestion, Dyspepsia, etc. For derangements of the brain use Horsford's Acid Phosphate. Dr. D. P. Boulster, Augusta, Me., says: "In functional derangements of the brain and nervous system I have prescribed it with gratifying results."

HORSE MEAT.—Nearly 14,000 horses are annually consumed as food in Paris. In Vienna and Berlin the annual consumption is about 6,000 horses each.

WRONG CYLINDER.—A. D. 2000: "Did you go to hear the phonographic parson this morning?" "Yes; but they got in the wrong cylinder, and we had Rienzi's address to the Romans instead of a sermon."—*N. Y. Herald.*

BIG CAPITAL.—A special meeting of the stockholders of the Edison General Electric Company will be held this month at the offices of the company, 42 Broad Street, New York City, to vote upon a proposition to increase the capital stock of the company from $12,000,000 to $15,000,000.

TAMMANY VICISSITUDES.—Newly-appointed Police Justice: "Your face is familiar to me, prisoner. Where have I seen you before?"

Prisoner (formerly a police justice himself): "I had the honor to send your honor to the penitentiary once when I was on the bench."

The Judge: "Six months."—*Life.*

ORDERED OUT.—The electric light company at Rich Hill, Mo., employed a colored man to operate its plant. A committee of whites waited upon him and notified him that if he continued to hold the place it would be at the risk of his life. The negro became frightened and left the town, and now the company is without an engineer.

HYPNOTISM NOT MAGNETISM.—The experiments of Dr. Charcot, in Paris, have been cited to prove the magnet's mesmeric value. This celebrated specialist did obtain some striking results with a sensitive hypnotic subject under the influence of a magnet. Dr. Charcot not long after repeated the same experiments with the same subject, using, however, a dummy magnet made of painted wood, instead of the real one he had used before. He obtained the same hypnotic results, showing very clearly and positively that magnetism had "nothing to do with the case."

ROUGH ON INSECTS.—Washing floors and shelves with strong pepper tea, or hot alum or borax water, will destroy ants and roaches.

GLASS PLATE.—A glass manufacturer has succeeded in producing glass plates of great breadth, and any desired length, by means of rolling.

TO PRESERVE COLOR.—A little borax, put in water in which scarlet napkins and red-bordered towels are to be washed, will prevent them from fading.

PATENT CAPITAL.—The United States Government Commissioner of Patents estimates that from six to seven eighths of the entire manufacturing capital of the United States, or $6,000,000,000, is directly or indirectly based upon patents.

LOCAL OPTION.—Whiskey will take out every kind of fruit-stain. A child's dress will be entirely ruined by the dark berry-stain on it, but if whiskey is poured on the discolored places before sending it in to wash, it will come out as good as new.

HYPNOTISM INEFFECTIVE.—Dr. Charcot, who has recently finished a long series of experiments with hypnotism, gives as his opinion that not more than one person in 100,000 would be likely to be benefited by this mode of treatment.

DEEP SEA.—Black Sea soundings are said to show that below the depth of 600 feet the water is so impregnated with sulphurated hydrogen gas, emanating from decaying animal and vegetable matter, that living organisms are not found there.

WORTH REMEMBERING.—The talent of success is nothing more than doing what you can do well, and doing well whatever you do without a thought of fame. If it comes at all, it will come because it is deserved, not because it is sought after —*Longfellow.*

FRENCH HENS.—A trade journal has just published some statistics concerning poultry in France. It states that there are in the country 45,000,000 of hens, which, at an average price of 2 francs 50 centimes per head, represent a value of 112,050 000 francs.

Maid for easy Housework —Pearline. *Made* to save work and wear in all kinds of washing and cleaning. *Made* into a powder for your convenience. *Made* as cheap as pure soap for economy. *Made* harmless for all purposes for which soap is used. *What a friend*—a friend who did half your washing and cleaning and made the other half so easy that you did not get too tired to enjoy the time saved; besides made things last longer and look better. That's just what Pearline will do for you if you'll let it. On the back of each package you'll find how it will best befriend you. Every grocer keeps Pearline, and many of your friends use it—ask them about it.

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.*

180 JAMES PYLE, New York.

ACCURATE AND INDIFFERENT.—Prof. John Trobridge once said: "The difference between the scientific man and unscientific man is, that one makes accurate measurements, while the other is satisfied with general knowledge, and does not ask 'How much?'"

DIET AND HAIR.—It has been suggested that the study of the influence of diet and habit upon the color of hair in different nations of men may cause discoveries by which the color of the hair in the human race may be modified by judicious treatment.

WORTH TRYING.—It is not generally known that ink-stains can readily be removed from the fingers with the head of a parlor match. Moisten the ink-stained spot and rub it gently with the head of the match, keeping the skin wet so that it will not be burned.

BRITISH ADULTERATION.—In England and Wales, out of 26,954 food samples which were recently analyzed, 3,096 were found to be adulterated. This is equal to 11½ per cent.—a percentage lower than in any previous year since 1888, when it was under 11.

COLD WAVES.—Prof. T. Russell defines a cold wave as a twenty-degree fall in temperature in 24 hours over an area of 50,000 square miles, the temperature in some part of this area descending to 36 deg. During the past ten years there have been no less than 691 cold waves in the United States.

KITCHEN THERMOMETER.—Miss Flora Grace, of Iowa, is the inventor of a cooking thermometer, which, instead of registering "summer heat," "blood heat," and "freezing point," marks the boiling point, the gently simmering altitude, and the varying baking points for meats, bread, cake and pie.

MARK, AND AVOID THEM.—Dr. Broadbent, in an address before the British Medical Association, says a mark of a weak medical man "is the indiscriminate use of stimulants in fevers, a ready resort to narcotics and sedatives, treatment directed to symptoms only, and a fondness for new drugs of high sounding names."

WHAT IS WEALTH?—An English statistician says that public wealth is made up of ten items, every one of which can be calculated to a nicety except the value of public works. Thus land is worth thirty times the assessed annual rental valuation. Houses are worth eighteen times the rental. Furniture, according to insurance agents, is worth, on an average, half the value of the house. In the comparison of aggregate values arrived at by this computation our own country comes out ahead. The wealth of France is $45,500,000,000; that of the United Kingdom, $48,000,000,000; and that of the United States, $68,000,000,000.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is

THE STRONGEST

of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Jan. 5, 1891.

The following are the market prices to-day at New York.

	New York.
Fancy Hay	60c. @ 65
No. 1	55 @
No. 2	50 @
No. 3	45 @
Shipping	40 @ 45
Clover mixed	45 @ 50
Clover	40 @
Prime Rye Straw	85 @ 90
No. 2 "	75 @ 80
Oat and Wheat	45 @ 50

Receipts week ending Dec. 27, as follows:
Via N. Y. Central, 209 cars.
" West Shore, 103 "
Total, 312 cars.

From other roads by Lighter to 34th Street, 25 cars.

The market for the past week has been steadily growing weaker, owing to continued heavy arrivals and very bad condition of the streets. The movement of hay has been slow, which has caused an accumulation of stock on hand to a considerable extent, and, as usual at such times, buyers take the advantage of the situation and bear the prices down, as will be seen by the above quotations.

All grades have in a measure suffered the same decline, except, in a small way, fancy hay will bring 65c.

Straw is fairly active, and accumulations fast clearing up.

OSCAR KENT,

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$14.50 to	$15.00
Hay, choice to fancy, perpetual pressed bales	13.50 to	14.00
Hay, fair to good	12.50 to	13.00
Hay, poor to ordinary	10.00 to	12.00
Hay, Clover and Clover mixed	 to	
Hay, swale	9.00	
Straw, Rye, good to prime	17.50 to	18.00
Straw, Oat	9.00 to	10.00

BOSTON, Jan. 5th, 1891.

Receipts for the week are 278 cars of hay and 20 cars of straw; corresponding week last year, 169 cars of hay and 15 cars of straw. There is no special change to note in the market from a week ago. Receipts have been fully equal to the demand, which has not been active. There is still on the tracks of the various railroads, unsold, quite a large amount of hay; the bulk of the stock being on the Fitchburg road. We quote the market quiet at quotations.

Market for Rye straw is very firm; some very choice cars occasionally exceeding our quotations.

Great English Remedy for GOUT, RHEUMATISM and KIDNEY COMPLAINTS.

SURE, PROMPT and EFFECTIVE.

Large Box. 34; Small, 14 Pills.

At all Druggists, and

224 WILLIAM STREET, NEW YORK.

RIDGE'S FOOD

The Most Reliable Food
For Infants & Invalids.
Not a medicine, but a specially prepared *Food*, adapted to the weakest stomach. 4 sizes cans. Pamphlet free. *Woolrich & Co.* (on every label). *Palmer, Mass.*

HAMMOND'S

CELEBRATED

Calumet Oleomargarine

Strictly pure, cheap and healthful.

Ask your grocer for it.

Put up in packages of all sizes, also prints and rolls.

C. H. HAMMOND CO.,

607 to 615 THE ROOKERY,

CHICAGO.

Also offices at Boston, South Omaha, Neb., and Hammond, Ind.

Pure LAGER BEER,

"IMPERIAL" and "CULMBACHER"

Brewed & Bottled SPECIALLY FOR HOTELS, CLUBS AND PRIVATE FAMILIES

BY

Beadleston & Woerz
291 W. 10th St. New York.

Orders by Postal Card promptly attended to.

NATURAL MINERAL PURGATIVE WATER.

From the Springs of

VILLACABRAS.

Prescribed by the Highest Medical Authorities.

Stronger effects than any other under smaller volume. No smell—no repulsive taste—no after-constipation—no gripes. As a daily laxative it can be taken, either pure or mixed with milk, tea or broth.

Sold by all Good Druggists.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

PENNA. SALT MANUFACTURING CO.,

NATRONA CHEMICAL WORKS. PHILADELPHIA, PA.

DR. PRICE'S CREAM Baking Powder.

Most Perfect Made

A Pure Cream of Tartar Powder—
Superior to every other known.
Used in Millions of Homes—40 Years the Standard.
Delicious Cake and Pastry, Light Flaky Biscuit, Griddle Cakes
Palatable and Wholesome.
No other baking powder does such work.

THE GREAT AMERICAN TEA COMPANY

LADIES GET UP ORDERS. Entire New Departure. A HANDSOME PRESENT TO EVERY SUBSCRIBER.

THE GREATEST INDUCEMENTS EVER KNOWN TO INTRODUCE OUR NEW GOODS.

If you enjoy a cup of **Delicious Tea** send in your orders. 3½ lbs. Fine Tea by mail on receipt of $2 and this "ad". Beautiful premiums given away with $5 orders and upwards. The **most extraordinary bargains** ever offered, during the next thirty days. China Tea Sets and Lamps with $10, $15 and $20 orders to introduce our excellent **New Crop Teas.** Formosa and Amoy, Oolong, Congou. English Breakfast, Japan, Imperial, Young Hyson, Gunpowder, Sun Sun Chop and Mixed. Good mixed teas 20c. per lb. Headquarters in United States for Fine Teas. One pound of our tea will go farther than three pounds of trash. Thirty years' national reputation for selling **Pure Goods Only.**

THE GREAT AMERICAN TEA COMPANY,
P. O. BOX 289. 31 and 33 Vesey Street, New York.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

All New Subscriptions sent now will be good until January, 1892.

GLENN'S SULPHUR SOAP.

Glenn's Sulphur Soap is the **Original** and **Best** combination of its kind, and the one now generally in use. For sale by **All Druggists.**

Beware of Counterfeits.

Wholesale Depot,

C. N. CRITTENTON,
115 FULTON STREET,
NEW YORK.

Be progressive and keep abreast of the times. Avoid dyspepsia by using **Lard Compound** and **Cottolene,** a substitute for lard.

The highest medical authorities pronounce them healthful; and expert cooks commend them.

Our **Clairette** brand of cotton oil soap is the purest and best laundry soap in the market; as pleasant to the hands as genuine castile.

N. K. FAIRBANK & CO.,
CHICAGO AND ST. LOUIS.

SUCCI'S FAST.

Succi, the Italian faster, who began a fast of 45 days in New York on November 5, ended his feat at 8.23 P. M., December 20, 1890. Other fasters have gone forty days without food, but they were so weak that they could not sit up. Dr. Tanner could not sit up after the tenth day, and could not write his name after the fifteenth day, but Succi scorned the idea of weakening all through the weary weeks. On his fifteenth day he rode seven miles on horseback, and exercised every day after. During his fast Succi drank freely of water, and took small quantities of a liquid which he calls an elixir, and which is supposed to contain morphia. At 6 P. M., December 20, he was examined and his weight was found to be 104¾ pounds; on November 5 it was 147¼ pounds—a loss of 42½ pounds, or less than a pound a day. His temperature was 98.2; pulse, 62; respiration, 19; general condition weak; tongue clear, moist and steady. The bulletin was signed by the thirteen physicians who have watched during the fast. The worst attack of gastric trouble that he had during his fast occurred on the last day, during which his pain was so acute that it was feared he would collapse; but his will-power carried him through. From 5 P. M. until he took his first cup of cocoa, at 8.20, his pain continued to be more or less acute. It was evident in many ways—by the distortions of his face, which was horribly shrunken; by his frequent change of position on the lounge upon which he was reclining; by the nervous twitchings of his wasted hands; by the restless glare of his deep-sunken eyes, and in various other ways. When the cocoa was prepared, shortly after 8 o'clock, Succi got off the lounge and staggered to the table where the nourishing diet was placed. The spectacle he presented was pitiable. He looked like a skeleton. The next day Succi arose from sleep after a long slumber, which he fell into shortly after his feat was ended, and an elaborate meal was placed before him. He ate with extraordinary relish. Following is the menu: Anchovies, with butter; chicken soup, with rice; fried smelts, fried calves' brains, quail on toast, cocoa pudding, fruit, confections, ice-cream, coffee; one-half pint Rorals Extra; one-half pint Grand Sec. He occupied two hours in consuming the food placed before him. He never faltered, but ate with zest.

CAN WE HAVE CLEAN STREETS?

The recent heavy snow-fall in New York, and the difficulty of disposing of the snow, have elicited many suggestions on the important subject of street cleaning. It has been estimated that it would cost over half a million dollars to remove the snow from the 360 miles of paved streets in this metropolis. Professor Chandler, for ten years President of the Board of Health, when asked if the streets of New York were kept clean within the meaning of the statutes, prior to the recent snow-storm, replied that they were not, and because there had been no proper business system and no system free from politics. "We have," said Professor Chandler, "a guerilla system of street cleaning, which should be wiped out and an organization effected on the improved lines of the police and fire departments. I prepared a plan ten years ago for keeping the streets clean by a commission to consist of the mayor, the commissioner of public works and the presidents of the police and health departments. It was on the block system, and called for an organized, uniformed and permanent force of street sweepers, to be appointed much as men now are when chosen as policemen or firemen, and to be appointed for life or during good behavior." Professor Chandler further stated that by laboratory experiment he had found that street dirt is useless as a fertilizer, and its only value was to fill in sunken lots. The difficulty of keeping the streets of a great city clean is scarcely less than that of maintaining an efficient police or fire department, and yet it is frequently carried out in such an unsystematic way that the expense is greatly increased, while the work done is performed in a hap-hazard, careless way. The suggestion of Professor Chandler that an organized, uniformed and permanent force of street sweepers be maintained, and the work done on the block system, is a good one, and certainly the reproach of dirty streets is one that from considerations of health, decency, and pleasure, should receive much more attention in American cities than it does at present. As compared with the streets of European cities, and especially with those of Paris, the streets of most American cities are disgustingly dirty. In dry weather they are not so much noticed, except on windy days, when a bewildering variety of dirt and fertilizers effects a lodgment in the eyes and on the clothing of pedestrians, but on rainy days the slush and dirt are simply intolerable to those who have been accustomed to the luxury of clean streets.

BRIDGET SUPERSEDED.

If the civilized portion of the human race were to vote upon the question, what is the next great labor-saving invention for which there is a long-felt want, no doubt a large majority would be in favor of an invention which would enable us to dispense with the servant girl. The invention has been made and patented. It is an improvement in dwelling houses. Strange to say, the inventor, Mr. L. E. Ladd, lives in Philadelphia, famed already as the city of dwelling houses. The improvement consists in a block of twenty-four or more buildings upon one lot of ground, each of which communicates through a passage-way with another building in the centre of the lot, which contains the general kitchen, laundry, supply-rooms, heating and ventilating apparatus, electric light plant, etc. A dining-room is built in the rear of each house, immediately adjoining the passage to the general kitchen. The central building would be connected with each of the houses in the block by a speaking tube or by telephone, whereby the housekeeper could order supplies in advance for each successive meal, the superintendent of the general supply building thus having the opportunity to buy in large quantities and better suit individual tastes. Like all co-operative schemes, the idea is a very attractive one, but it will need a capitalist with nerve to put up such a block of buildings and a good agent to induce people to live in them, before it will be much of a success. The one that puts the idea in successful practice will be worthy of more credit than the inventor.

SCIENTIFIC SWINDLING.

Reference was recently made by the *Electrical Review* to the possible adoption of electric welding to the minting of bi-metallic coins. The idea is ingenious, and likely to prove entirely successful. It now appears, according to that same authority, that electrical

COLGATE'S COLEO.

A PURE PETROLEUM PRODUCT FOR TOILET AND MEDICINAL USE.

methods have already been applied to reducing the weight of coins, but for a less laudable object. It has recently been noticed that a large number of light gold coins are in circulation, and the discovery has been made that the "sweating" is accomplished by electrolysis. The scientific swindler constructs an electro-deposition plant, using a ten dollar gold piece as an anode and a small metal plate as a cathode. The battery is "set in motion" (newspaper sciencific terminology), and, presto! in a few minutes 50 cents worth of gold is deposited on the metal plate, and the gold coin is worth so much less than before. As the gold is removed equally from all parts of the surface of the coin, its appearance is scarcely altered by the process, only an expert being able to detect the slight blurring of the design and lettering. When the coins come to be weighed, however, the result is more apparent, and cases have lately come to light where large payments made in gold have revealed light weight to the tune of several hundred dollars. Truly, this is the age of electricity, when electrolysis is turned to account by thieves and swindlers for sweating the currency! It is to be hoped, for the vindication of science, that the same subtle agent that is at present being subverted to further such nefarious schemes will bring about the capture of the schemers.

EATING WITH MODERATION.

HOW PEOPLE STARVE THE BRAIN WHILE FEEDING THE STOMACH.

The persons living to a green old age, who have come within the range of my observation, were abstemious themselves, and had either sprung from poor families or came from the South, where heavy meat meals are not enjoyable (says Mrs. Crawford in London *Truth*). Guizot, who was not a vigorous trencherman, started in poverty, and was a Southerner. Thiers started in the same condition, ate twice a day and very heartily, but was so heavy after eating as to be obliged to go to sleep. He died of apoplexy after eating. I attribute the extraordinary difference in quality in the early and late works of Victor Hugo to his having only scant meals when he wrote the former, and to his having plentiful and delicious ones, to which he did the fullest justice, when he turned out the latter. Victor Hugo was *spirituel* before lunch or dinner; he was inflated in speech and bereft of all sense of the ridiculous when digesting either repast. M. de Lesseps is almost Oriental in his abstemiousness at table, he being of a Southern family and having lived long in hot countries, which are perfectly healthful to those who adapt themselves to the climate. I dare say he owes his longevity and high spirits to his sobriety in food as well as in drink. Volumes have been written against drunkenness. But any doctor who understands well the human frame will tell you (if he can cast aside humbug) that drink is not as bad in its effect as gormandizing. Nothing so hastens senility as the latter. I should like to know how Ninon l'Enclos ate and drank, but fancy she must have been temperate to be so brightly intellectual, as well as good-looking, to a great old age. Catherine de Medici made it a rule to rise from table with an appetite, and to prefer lentils and onions and chestnuts to meat. She brought Italian confectionery into fashion and was always rating her married daughters, when she corresponded with them, for eating so much and fatiguing themselves so little. M. Barthelemy Saint-Hilaire, though eighty-four, works as hard and with as little fatigue as he ever did in his life. Twenty years ago he said to me: "I am persuaded that the civilized man eats three times more than what he needs when he is not checked by poverty. For my part, I was too poor until I was elderly to be a gourmand, and when I now go to dine at a friend's house I only play with my knife and fork. Dinner is a mistake." The Czar, his brothers and his uncles, are all gormandizers, and what a heavy wearied lot they all look, unwieldy as megatheriums and about as intelligent. I have never doubted, since I began to think upon the subject, that George the Third ate himself into the mad doctor's hands, and Louis the Sixteenth into semi-imbecility. Who were the great men of the eighteenth century? Voltaire, who lived on coffee and had too weak a stomach to bear much food; Washington, who was spare and abstemious; and at the Revolution, the people of Paris, who were starvelings. Sankey easily explains his success when he says that all he wants is a crust of bread, a mouthful of meat when he can get it, and a cup of tea. The Scotch were a proverbially hungry people when they turned India into a British dependency. I know a literary woman who leads a singularly laborious life, and thrives in health and spirits on it. She says that she owes in a great degree her good spirits and capacity to get through any amount of work, of worry, and of strain on the nervous system, by cutting dinner. What with serious occupations, running to exhibitions, theatres, balls, and what-not, she is hardly ever in bed before half-past two in the morning, and more often three; yet she gets up at nine and keeps fresh, lively, and active though weighted with *embonpoint*. This is her dietary: A bowl of warm, unsugared milk, flavored with coffee, is taken without anything else at nine in the morning. Lunch is at half-past twelve, of fish, one meat dish, cooked vegetables and cheese. Salad is taken pretty often, and the meal is followed by several small cups of black coffee. When cherries, currants, or strawberries are in season, a plateful of one or the other is taken at six o'clock, without any other sort of food. Otherwise there is an unbroken fast from lunch to one or two in the morning, when there is a slight refection made of vegetable broth or chicken broth, a small roll of hard-baked bread, an egg, and a little cheese. My friend tells me that she most enjoys living when slightly hungry; then her mental consciousness is most keen and her wits are most wakeful. Not being thin, she never feels, however long she may go without breaking her fast, the pangs of hunger. She walks three or four miles daily. It is torture to her to engage in intellectual work after a repast, when the stomach, if the brain has to work, gets in conflict with it. The theatre is not enjoyable just as one is rising from table. Query: May not the decay of the drama be traced to the heavy seven o'clock meals of box-hirers? "The *polissonnerie* of the ballet," said the director of the dance department of the Opera-House to me the other day, "is due to its great patrons being rich *petits creves* and hoary financiers and other rich old men. They come gorged with palate-tickling food to the opera, and want something that is at once a *polissonnerie* and a *tour de force*. Gracefulness is thrown away on them." I have been discussing the dinner question with a Jew, aged eighty, who is an enthusiastic Mosaist. He himself ate the *vache enragee* until he was five-and-twenty, and thinks it was the making of him. The reason he gave why his brethren bear so well all climates is that they spoil their meat when they prepare it according to the prescriptions of their religion. It is first bled, and then steeped in salt and water until redness stains the water. This unfits it for the spit or the grill, and does not make it toothsome in a stew—the only way in which it can be done, unless boiled. Meat thus prepared has no savor, and does not tempt the Jew to eat of it gluttonously. Dying of apoplexy does not much matter, since every one must die of something. But, as my aged Hebrew friend observes, it does matter to be for years in a state that ends in apoplexy—to wit, with a starved brain. The brain starves in the midst of too great plenty, because gormandizing clogs the capillary arteries which bring life to the brain substance. The blood does its best to do its work, and in its efforts at last bursts a vessel. I once knew an impresario, who was also a Jew. He was behind any number of lyrical theatres, from Stockholm to Sydney, cafes-concerts, music-halls, and other places where singing was the attraction. He held carniverous feeding in horror, and told me that he never lost his time seeking for fine voices in countries where a fish or a meat diet prevailed. The most fish-eating Italians—those of Naples and Genoa—have not often among them sweet singers. The most meat-eating part of Great Britain—England—is also a voiceless country. Though the singing is so fearful in the Scotch kirks, my friend found some divine songsters south of the Grampians, and a greater number in the Highlands. He often heard peasant Irish women "lilt" and sing like nightingales, but never in the towns. Sweden was a country of song, because a country of grain. Norway was not—too much fish was eaten there. Vocal capacity disappeared in musical families who got rich. They ate too much meat. The vocal birds are eaters of grain, fruit, and vegetables. No carniverous one could ever sing a song. It croaks, has a bad liver, and is generally melancholy.

PAINT FROM CINDERS.

UTILIZING REFUSE SLAG OF A NEW JERSEY IRON FOUNDRY.

A newspaper correspondent writing from Boonton, New Jersey, January 3d, says: "When the ancestors of the rich Lord family in New York turned out cannon here at Boonton away back in 1778-81, and piled up the cinders that came in big chunks from the puddling furnaces, they never supposed this refuse would be good for anything. The cannon and cannon balls that were manufactured in this inland Jersey town, and sent over to Washington's army at Morristown, helped to secure American independence, and the cinders soon made a huge pile along the banks of the rushing Rockaway River. In after years, as the Boonton iron works became more and more famous, the piles of refuge from the mills increased. High embankments of cinders surrounded the works, and it became a problem how to dispose of this heavy and supposedly useless material. As the township laid out roads in the vicinity, this slag, as it is generally called, was carted into the country and used for filling in or for road-beds. The result was that for miles around the iron slag became part of the soil, and is still mixed in with the clay and slate that compose the earth. It was considered a nuisance by the owners of the iron works, and they were glad to get rid of it in any way possible. To-day the great heaps of slag have a commercial value that is constantly increasing, and the price of Boonton slag promises soon to be quoted in the iron market of the country. The discovery that it had value is of comparatively recent date. The old furnaces were shut down for years after the death of one or two of the Lords, and it was only after the management of the Lord estate came into the hands of Benjamin Nicoll, who married a daughter of Daniel Lord of Morristown, that the works were started

p and the slag was found to possess commercial value. Mr. Nicoll is a brother of De Lancey Nicoll, who follows John R. Fellows as District Attorney of New York. He is an active, athletic young fellow, a graduate in the famous Princeton Class of '77, and captain of the only boat crew that the orange and black ever sent to Saratoga and won a pennant with. The moment he was put in charge of the Lord interests here he began to see what could be done to bring the place out of obscurity and make the native products profitable. Two years ago some New York capitalists and business men, including Erastus Wiman, Aquilla Rich, and Lawrence S. Mott, began an investigation into the merits of the Boonton slag with a view to using it as a base in the manufacture of paint. Mr. Rich, who was formerly one of the members of the big paint house of C. T. Reynolds & Co., was interested in the process of converting slag into paint, discovered and patented by James P. Perkins of Pullman, Ill. Mr. Perkins was the manager of the iron and steel works conducted by the Pullman Palace Car Company, and he had made a number of successful experiments with slag paint from the refuse of the Pullman furnaces. The Boonton slag was subjected to careful analysis by Prof. Ricketts of Columbia College, and Prof. Austen of Rutgers College. These careful chemists reported that the slag was very rich in iron, containing from 55 to 70 per cent. of pure oxide. They also discovered that in this slag the particles of iron were all incased in particles of silica or glass, which added to its value, and had prevented the slag, much of which had lain for over a century and had been subjected to every kind of weather, from corroding. On the strength of those reports a company was organized, with Mr. Wiman as president, and buildings were leased, machinery introduced, and the manufacture of paint begun under Mr. Perkins' supervision, as his patents were purchased by the company. The product has been a marked success, and Mr. Rich says it is working a revolution in the paint trade. When Mr. Nicoll had made a contract with the paint company for the delivery of the cinders at a fair price per ton, which made necessary the employment of men to dig the slag from the ancient heaps and cart it to the paint mill, he began to look around for other fields of usefulness and profit for the slag. He induced some iron furnace men to examine the material, and when Harry Villard and his German friends established the United States aluminium factory here, last spring, the slag had a big boom. Furnace and rolling mill owners were astonished to find as much, and often more, iron in this refuse material than they got out of their native iron mines in the upper part of this State and over in Pennsylvania. Instead of going to the trouble of mining the ore, here was an inexhaustible supply lying around idle, and which could be bought, delivered, and worked into merchantable products for less than the ore could be mined for per ton. That this discovery is proving profitable to the Lord estate, and is considered of inestimable benefit to the iron men, is best shown by the fact that the Pequest Furnace Company at Oxford, Warren County, sent in an order a few weeks ago for 10,000 tons of the slag, and it is being dug out and shipped by Mr. Nicoll at the rate of 1,000 tons a week. The paint company has already sold 2,500 tons, and nearly fifty men are daily at work loading and delivering the product. As it is estimated that there are over 300,000 tons in the heaps in sight here in Boonton, to say nothing of thousands of tons along the country roads hereabouts, there is no danger of the supply running short very soon. That there are other uses for this century-old slag seems certain. All sorts of experiments are being made, and several unique and interesting discoveries have already been made. It is found, for example, that pulverized slag, being absolutely fire-proof, could be used on roofs and for theatre curtains, as asbestos is now used. It is an excellent cleanser of silver and brassware, and Prof. Austen made a cake of soap out of Boonton slag recently that was quite up to the standard of ordinary soap. Whatever additional virtue may or may not be found in the old cinder beds, the uses to which it has already been successfully put are assuredly of great interest."

GUN COTTON.

HOW IT WAS ACCIDENTALLY DISCOVERED.

Usually important discoveries are the result of the expenditure of much skill and labor; but it is quite often the result of the merest "accident." Nearly every one is familiar with Goodyear's discovery of vulcanizing rubber, also the late discovery of saccharine; but the particular object of this paragraph was a reference to the accident which led to the discovery of gun cotton, which, according to a contemporary, from which we copy, has never before found its way into print. That paper says: "In 1846, Boettger and Shoenbein had a laboratory in Frankfurt, Germany, where they also gave instructions in chemistry. They resided with their families in the building where the laboratory was located and Mrs. Schoenbein, being a very economical lady, would "gather in" any odd material found lying about the laboratory. It so happened one morning that a lot of oakum, used in wiping off dishes similarly to the present use of sawdust, was found by the frugal wife, who directed a domestic to wash it and spin it at night as "recreation" after a hard day's work. This young person, by accident, fell into the embrace of Morpheus, and Mrs. Schoenbein awakening late at night and finding the light burning, rushed into the room with a candle in her hand to see what was the matter. In bringing the flame a little too close to the oakum on the spinning-wheel a terrific explosion took place, and persons appearing on the scene found both mistress and servant in a fainting condition. Upon investigating the cause the next morning, it occurred to Schoenbein that the oakum had been used to clean a large dish containing sulphuric acid and potassium nitrate used in illustrating an experinent. The acids had converted the impure cellulose oakum into pyroxylin.

DO CATS SPREAD DISEASE?

THE QUESTION OF DOMESTIC ANIMALS CARRYING CONTAGION.

A peculiar incident occurred in Indianapolis recently, says the *Sentinel* of that city. A case of diphtheria broke out in a certain neighborhood, and to insure safety from the disease the family sent their child to another part of the city to remain for a time. In this locality there was a case of scarlatina, and the little child contracted the disease, it is supposed, from playing with the cat which came from the infected house, and died from the effects. Another case is cited where children contracted the diphtheria from playing with a cat belonging to a family where the disease prevailed. Leading physicians say that while there are quite a number of single cases, the disease cannot be considered epidemic. In studying the best methods of preventing an epidemic, much attention is being paid to the question as to whether domestic animals, cats especially, do carry contagion or not. Physicians disagree in regard to this theory. Dr. H. M. Lash is of the opinion that there is no doubt that infectious diseases can be spread by animals; cats especially, by being handled by various people, are liable to carry the germs of disease in their coats, and these germs, coming in contact with a person's hands or clothing, under certain conditions develop the disease. Dr. Lash favors the opinion that clothing, money, letters, and the atmosphere will carry the disease germs, and patients afflicted with contagious diseases should be quarantined, to insure safety. Dr. Runnels holds that while the theory of a child's contracting the scarlatina from playing with a cat is possibly tenable, it is hardly probable. He has known of no such case. It is now a disputed theory among physicians as to whether the scaly particles that fall from the persons of scarlatina patients are infectious or not. It has been the general opinion that this was the most contagious stage of the disease, but experiments have shown that while in some cases these scales have proved infectious, in other cases they have not. Dr. Runnels shares the opinion of a noted Chicago physician who is considered an authority on the diseases of children. The physician, in an address, stated that certain diseases, as measles, scarlatina, and diphtheria, are peculiar to children, and all children are liable to them. He believes that if a lot of children were taken out to an island and isolated from every other human being and animal, even in the purest atmosphere they would have these diseases. Dr. Runnels is of the opinion that while a dog or cat might possibly carry a germ of disease which might prove infectious, the person would have to be liable physically to take the disease. He does not think that money is liable to carry infection, unless it has been in the mouth of a patient, and then another person takes it in his mouth. The atmosphere, too, in Dr. Runnels' opinion, can hardly be considered a medium for spreading disease from different parts of the country, since the currents of air are hardly the same outside a radius of 200 miles. Dr. T. N. Bryan has little faith in the theory that cats carry disease. While it is a possibility, it is not a probability. There are extremists in everything, and the bacteria or germ theory is carried to extremes in some cases. Thirty-five years ago diphtheria was not known. It first broke out in Pennsylvania a few years later. While there are genuine cases of diphtheria nowadays, much of the so-called diphtheria is various kinds of throat trouble. Danger of contracting disease lies more in lack of cleanliness and good sanitary regulations than in contact with the so-called germs. Contagious diseases often run through families and neighborhoods from some local cause, as bad drainage, etc.

WISE FORESIGHT.—A man came into my study last week who told me of a new method of finding a boarding-place. He went, he said, into a good meat shop and asked the butcher to tell him of the boarding-houses where he sold the best meat. The butcher gave him two places, and he at once went and engaged board. The method was new to me, but it was pretty wise. It was certainly going to the foundation of things.—*The Advance.*

SANITATION AND HEALTH.—When man contaminates his abode and surroundings, he must employ artificial means to supply that which he has taken from the purifying forces of nature. It has been shown in cities where plumbing regulations have been adopted, that the death-rate has decreased since these regulations went into effect; yet there are those who mock at sanitary plumbing.—*Sanitary News.*

SARCASTIC.—During the greater travel of the holidays I have been confirmed in an opinion that I formed long ago—that the entrance gates to the ferries, Brooklyn Bridge, and other arteries of travel should be set aside exclusively for the convenience of ladies who desire to exchange a little harmless gossip after the fatigue of shopping. As things are ordered now, the ladies seldom get a chance to settle down to a comfortable chat just in front of the ticket window before they are hustled and crowded by some blundering man, whose dull imagination sees nothing in an entrance gate but a place to get through. At comparatively small expense passages could be constructed around or over or under the entrances for the use of these unreasonable beings, and the ladies could form in line at the regular approaches and discuss the affairs of the day at their leisure.

GREASE-SPOTS FROM MARBLE.—Smear the spot with a layer of a paste of chalk and benzol (not benzin) to the depth of about an eighth of an inch. Cover with a wet cloth to prevent too rapid evaporation and leave in contact until the benzol evaporates. If unsuccessful the first time, repeat the process. Another receipt says cover the spot with quicklime and wet with an aqueous solution of sal soda. Leave in contact for several hours. Repolishing will be necessary after resorting to this process. A better plan would be to make a paste of the lime and soda lye before applying.

COMELINESS AND DIET.

THE RELATION OF FOOD TO PERSONAL BEAUTY.

Thomas Carlyle, a mighty thinker, but a man of perverse moods and a chronic dyspeptic, wrote admiringly of an ideal "eupeptic" man as one who was brave, dutiful and dominant. From the depths of his unhappy experience, a victim to the "vile hag, Dyspepsia," the rugged Scotchman perceived the immense advantage which (other things being equal) the man of good digestion possesses in the battle of life. Carlyle's hero is emphatically a strong man; but viewing him from another standpoint, we may also be permitted to affirm that he is a handsome man. This statement may seem to be made in the spirit of the time-honored adage, "handsome is that handsome does." It admits, however, of a ready explanation. For in what does personal beauty consist? What are its chief elements? We are not able, it may be said, to add to or to take from our stature, we cannot alter the contour of head and face, and cannot train features to beauty of form. These objections are perfectly valid. At this period of the world's history, after the great fusion of races, or, at least tribes, which has taken place in Europe, we cannot expect to find the ideal purity of features which distinguished the nations of classical antiquity and especially the Greeks. Perfect regularity of features, or facial beauty, from an absolutely artistic point of view, we do not look for, scarcely even desire in men. That which adorns man is the stamp of intellect and strength set upon his face. Beauty in the male chiefly consists in a well-developed form and an expressive countenance. Functionally active facial muscles perpetually responding to the impulses of an active mind give interest, variety and, in a sense, beauty, to features otherwise of an ordinary type. That intellectual pursuits bestow dignity and distinction upon the human countenance is a fact noticed in an Egyptian poem of the XIIth Dynasty, written perhaps, 2,000 B. C. But when we speak of personal beauty it is especially of women that we think. In woman a rounded outline, grace of movement, delicacy and regularity of features, fairness of skin, gloss and luxuriance of hair, carry beauty to perfection. Yet even in the "fair sex," *par excellence*, the charmed beholder seldom pauses, or cares to pause, to criticise the form of features animated with ever-varying expression. Our highest admiration is not given to the

. . . . "cold and clear-cut face, as I found when her carriage past,
Perfectly beautiful: let it be granted her: where is the fault?
All that I saw (for her eyes were downcast), not to be seen)
Faultily faultless, icily regular, splendidly null,
Dead perfection, no more;"

but to the face instinct with love, mirth and vivacity. Beauty resides in the pure skin, sparkling eye, healthy bloom, pearly teeth, ripe and smiling lips, a refined, mobile and intellectual expression. And these are not fortuitous possessions. Disregarding for the present the influence of heredity, we may confidently assert that the essential attributes of beauty depend to a very great extent on proper food or more strictly, upon proper digestion. For, as I have elsewhere pointed out, food, though abundant and nutritious, may be so poorly prepared that the appetite is not excited, the palate pleased, or digestion thoroughly performed. Perfect development depends upon perfect nutrition. It is certain that nutrition cannot be perfect unless the digestive apparatus properly performs its functions. If the normal proportion of acid and ferment be disturbed in the gastric juice, or if the liver, pancreas or intestinal glands are deranged, if inactive kidneys and constipated bowels check the elimination of deleterious bye-products, the skin loses its softness and the complexion becomes dull. The beautiful violet tinge of the sclerotic gives place to a muddy hue, the flashing eye grows dull and heavy. The cellulo-fatty tissue of the face wastes, the features grow thin and wrinkles appear. Acne, seberrhœa, eczema, urticaria, erythema or furuncles may develop upon the face, the hair is liable to become dull and thin and the teeth to decay. The angles of the mouth droop and a haggard, anxious glance replaces the frank aspect of health. Irregularity of features which was scarcely noticed when the eye was bright and sparkling, the skin pure and the complexion brilliant, now becomes painfully apparent. It is doubtless true that woman is not to be prized solely for her beauty. Nevertheless, her beauty must always be a magnetic charm and is justly regarded by herself as a valued possession. Our American women are apt to fade easily because they neglect the laws of health. Women as well as men participate in and are injured by the keen competition and ambitious struggles of our social and commercial life. Among the wealthy the whirl of society, late hours, rich food, and neglect of physical exercise, breed indigestion and its attendant ills, and art is called upon in vain to repair or cancel ravages due to defiance of natural laws. In the poor or the middle classes coarse, insufficient or badly cooked food, eaten hastily without appetite and with anxious, preoccupied mind, transform the pretty bride, all too soon, into the thin, plain, jaded mother and household drudge. Good food, well-prepared, eaten leisurely and properly digested, preserves cheerfulness, a pleasant interest in the affairs of life, health and, what is by no means least deserving of our consideration, personal beauty.—*J. V. Shoemaker, M. D., in Dietetic Gazette.*

OLD PAPERS.

A PRACTICAL SUGGESTION IN THE INTEREST OF ECONOMY AND COMFORT.

In my recent consideration about domestic economy, I have thought a long and strong plea can be made, with utility upon the uses of common newspapers, or in fact any soft paper. Greasy dishes, knives and forks can be, when collected hastily, wiped over with a newspaper and cleaned of almost all of the grease, thus making the washing much more agreeable and cleaner, and spare the frequent changing of water and reduce the labor. Pots and pans can be divested of the sooty accumulations. The mud rubbed off from boots and shoes before brushing. The kitchen table spread over with a sheet of heavy paper, or two or three folds of newspaper upon which the hot pots and kettles may be placed without soiling the table during the serving of meals. Windows can be polished and table glass made to sparkle by free use of paper; and after use for all the above things, the paper can be burned at once or used to light the fires. Nothing is better for pantry shelves or the dresser than paper, which can be easily refurnished and saves scrubbing. Newspapers fresh, and with the strong smell of printer's ink, are admirable preservators of furs and woolens if freely used, and the articles completely enveloped. The carpets will wear better and not absorb dust nearly so soon if layers of papers are laid upon the floor instead of laying the carpet upon the bare boards. In packing dresses and crushable wearing apparel nothing equals tissue paper stuffed into the sleeves and beneath the trimmings and laid between the folds of the skirt. The advantage is that paper is so light, and retains a certain amount of resistance when placed under pressure if once rumpled, and not packed in smooth layers. The cleanliness and usefulness of paper cannot be excelled. When boots or shoes are to be placed in trunks containing other wearing apparel, it is easy to renew, and always sweet. Bottles can be packed with utter safety if sufficient paper is used to enwrap each bottle separately and not too compactly. China, glass and delicate metal ware cannot be insured with greater surety against damage than by the profuse use of paper. Sawdust or cork or straw make a certain amount of litter. The cork tubular papers are good, but require a certain expenditure, and if used in quantities are expensive. Many hospitals now employ paper blankets as warm, light in weight, and readily destroyed in case of contagious or loathsome diseases. The poor can have no better benefactor in winter than paper, when they are deprived of sufficient clothing. A folded paper across the chest and abdomen under their other garments, will be found warm and comfortable, and the shivering condition relieved. At night a few papers, which can be had almost for the asking, placed between whatever meagre wool clothing in their possession, will be found most effectual and agreeable. I have frequently folded a paper, shawl fashion, across my shoulders when traveling in railway cars and thereby averted the insinuating streaks of cold air which blow through every nook and crevice of the car. Paper used in the stockings upon the feet and legs will spare great suffering from cold feet. Pride is the only reason that the poor will offer as an excuse for not availing themselves of paper for warmth, but if those in better condition of life, more favored by fortune, would demonstrate its real utility, and how comfortable they could make themselves, I am sure this stumbling-block could be put aside. They may be likewise incredulous, and this must be overcome by a practical trial. The subject of paper bed-clothing is interesting many persons who are delicate, and find great exhaustion in supporting the necessary amount of blankets, etc., in order to keep warm. I have been shown admirable bolsters stuffed with paper torn in strips which curled up, and did not pack for a long time. Cracks in walls and floors can be stopped up by using paper wetted and crowded into them.—*Family Health Journal.*

BUDDHISM.

ITS ELEVATED STANDING AMONG THE WORLD'S RELIGIONS.

In Burmah the creed of Buddhism is held pure and undiluted, more so than in Ceylon, which is a strong citadel of the faith, and far more so than in China, where it is but one of several religions, each and all under direct State patronage and protection. In no country can its effects on the popular life and conduct be studied more fairly and completely than in Burmah, and the unprejudiced observer is disposed to assign to it a very high place among those religions of the world which can be professed reasonably by reasonable persons. It stands far above Brahmanism and Mohammedanism, and compares very favorably with Christianity itself. For, as the tree is known by its fruits, so the test of the value and practical worth of a religion should be its effect on the life of its professor—whether it enables him to live successfully as a healthful, happy, and self-respecting member of a civilized community. The faith which is clouded with gloom in this world, and doubt or a selfish and exclusive beatitude in the next, is but a poor thing, and is hardly deserving of serious attention. Buddhism seems fairly well to fulfill the condition of rendering the Burman life wholesome and happy. There are, of course, many very indifferent professors who violate or neglect the rules of conduct which the founder of the creed laid down; but laxity of practice is inseparable from all professions of faith, and does not invalidate the central fact that the effect of Buddhism on the great majority of its adherents is favorable. And there can be no country where religion more deeply enters into the very fabric of the national character and influences every important action of life. How poorly do the results of Christianity show by the side of even a negative creed like Buddhism. It is loudly proclaimed by its professors to be the only saving faith, and its missionaries are sent to preach its mysterious dogmas to the uttermost parts of the earth. But on the majority of Englishmen, the most cultured and the most degraded, it exercises no influence. The mass of the working classes ignore it altogether, and the Philistine middle class, among whom it has the firmest and deepest root, do not seem under its teaching to grow less dishonest and less material. Buddhism would

probably have been unsuited to the rough Anglo-Saxon temperament, but it is curious to speculate on the change which might have befallen the destinies of the world had England accepted Buddhism and Burmah Christianity.—*Fortnightly Review.*

LAURA BRIDGMAN.

A BLIND DEAF MUTE WHO READ, WROTE, SEWED, AND TAUGHT OTHERS.

"One of the most remarkable individuals of any time was the blind deaf mute woman Laura Dewey Bridgman, who was born in Hanover, N. H., December 21, 1820, and died May 24, 1889. During the first two years of her life, her faculties were normal; but in consequence of a fever, she lost the senses of sight and hearing, and those of taste and smell were greatly impaired. She was for 5 months confined to a darkened room, and her general health was not fully restored till 18 months thereafter. Her mind was uncommonly alert and active, and she manifested keen interest in what took place around her. She contrived for herself a motion language, and soon was able to communicate her desires, and to distinguish each member of her family. When she was approaching the completion of her 8th year, Dr. Samuel G. Howe, director of the Perkins Institution for the Blind, in S. Boston, undertook her education on plans of his own, with results that have made Miss Bridgman's case world-renowned. To teach her the names of things, those names were impressed in raised type on labels, and the labels pasted on corresponding objects—as a spoon, a knife, etc. Over these labels the pupil's finger was passed, and at the same time she was taught to ascertain, by feeling, the form and properties of the objects indicated. When she gave evidence of perceiving the differences between labels, she was encouraged to take the labels and lay them upon the articles indicated by them. The next step was, to give her the letters constituting the words on the labels, in their proper order, so as to spell the several names. Then the letters were given to her indiscriminately, and she was encouraged to assemble them in such order as to spell the names of the objects. She was taught next the finger-language of the deaf and dumb, and so was put in free communication with other minds. After a few months, she wrote this letter to her mother, using a grooved sheet of pasteboard such as the blind employ: 'Laura will write letter to mother. Laura will ride with father. Laura will make purse for mother. Mother will kiss and love Laura. Laura will go home.' The order in which notions of the parts of speech were conveyed to her was this: first, as has been seen, 'concrete' nouns, beginning with the names of familiar objects; then verbs (in the active voice), the meaning of these being signified by action—e.g., *hit* table, *open* door. Adjectives came next: *hard, soft,* etc.; but not till long afterwards was it found possible to give her the idea of 'abstract' nouns, such as *hardness, bitterness,* or of *space, time.* After adjectives, she was taught the meaning and use of prepositions by tactual illustration: ring *on* box, ring *in* box, etc. 'In this case,' wrote Dr. Howe, 'the perception seemed instantaneous, and the natural sign by which she expressed it was peculiar and striking. She spelled *o-n,* and then laid one hand *on* the other; she spelled *i-n,* and enclosed one hand *within* the other.' Of course at first one form of the verb expressed the action signified by it through all the moods, tenses, and other modifications: *Water drink Laura* meant Laura is drinking, has drunk, will drink, water. Miss Bridgman was a good seamstress, executed fancy needle-work with skill, and operated a sewing-machine. She read a great deal, and assimilated the ideas which she took in through her finger-tips: thus she was able to converse without embarrassment with cultivated persons. In a brief memoir of Miss Bridgman, Mrs. Julia Ward Howe tells us that her love of conversation was such that, while feeding herself with one hand she would spell her words with the other; that she was even seen to talk with her fingers in her sleep. She 'showed a love for long words and pleonastic expressions.' She made efforts often to articulate words, and was taught to say 'doctor,' 'baby,' 'apple,' and some other words. She was fastidious in regard to her attire. Her sense of touch was wonderfully acute: 'she sometimes detected the relationship of sisters by touch alone.' Her sense of humor was always keen, we are informed by Mrs. Howe; and she enjoyed fun and pleasantry. She was of highly social disposition, and derived much pleasure from the visits of distinguished people from all parts of the world to the Perkins Institution. She was led to the bedside of her benefactor, Dr. Howe, shortly before he died: 'the touching expression of her grief,' writes Mrs. Howe, 'on this occasion, and on that of his funeral, will never be forgotten by those who saw it.' She had some experience of the pleasure of teaching, as well as of being taught. While yet herself only a beginner in the acquisition of language, she was able to assist a little girl, inmate of the same institution, whose disability resembled her own; she helped also to teach a blind mute boy the finger-alphabet; to another pupil she taught arithmetic. In her diary she congratulates herself on her success in these efforts at teaching. Though she was far removed from all danger of ever being left destitute, she was by no means indifferent to money; in fact, she studied to accumulate wealth, and hoarded the gains that she made by the sale of articles of her handiwork."—*Knowledge.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, geese.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

CREAM OF BARLEY SOUP.—Chop a knuckle of veal in small pieces; fry half an onion in a little butter to a very delicate shade of brown; add a dash of flour, and mix, coloring the latter; add a pint of hot water or veal broth, and season with salt, pepper, a sprig of parsley, a stalk of celery, and four bruised allspice. Put the meat and bone in a saucepan holding three quarts of water. A little mutton trimmings will improve the soup. When done, let this come to a boil, and add the contents of the frying-pan. Simmer four hours, remove scum, and strain. While the soup is cooking, wash and boil a pint of barley, rub it through a sieve, and add to the strained soup. Whisk into it half a pint of rich, hot cream, and set the soup in the warm-water pan until wanted.

SALMON SANDWICHES.—Pound one pound canned or fresh-boiled salmon to a paste, with a suspicion of cayenne pepper, a little chopped parsley, half pound butter, and a teaspoonful of anchovy paste or walnut catsup. Cut the bread very thin, spread with the paste, trim off the crust, and cut into neat little sandwiches.

SCALLOPED CODFISH.—Take some left over fresh-boiled codfish that has had drawn butter served with it; pound it up fine with some of the drawn butter, adding a few shrimps; season with salt and pepper, and add a beaten egg yolk. Butter some baking shells, fill them with the fish, sprinkle crumbs over them; then pour on a little melted butter, and brown them in the oven.

APPLE MARMALADE.—Peel your apples; scald them till they come easily from the core; weigh your apples, and take the same amount of sugar. Damp the sugar with a little water and then boil it, skimming carefully until it is a thick syrup. Put in the apples pulped from the core and boil for fifteen minutes quickly, adding six cloves and the grated rind of a lemon; take out the cloves and fill your jars.

NUT CAKE.—Two cupfuls powdered sugar, one cupful butter, one cupful cold water, four eggs and the yolk of another, three cupfuls flour, quarter of a grated nutmeg, the grated rinds of half a lemon and half an orange, juice of the orange, one-quarter teaspoon of salt, two teaspoonfuls baking powder, one pint hickory-nut meats, and one cup of raisins. Beat the sugar and butter to a cream; add the well-beaten egg yolks, and the water gradually, with the flour in which the baking powder and salt have been sifted; add the flavorings and beat thoroughly; put in the raisins and nut meats, through which a very little flour has been mixed; add, the last thing, the well-beaten whites. Beat hard for a moment and bake in a steady moderate oven for about forty minutes. This makes two cakes. When they are cold make an icing with the white of the extra egg used; flavor it with orange juice and spread on the cakes; they should be as close and fine as pound-cake if properly made.

ALMOND PUDDING.—Peel and grate finely eight or nine tart apples; blanch and pound fine half a pound of sweet almonds; mix the almonds with the grated apples; add a little nutmeg, lemon rind, and about a half teaspoon of butter, and sweeten to taste. When all these ingredients are mixed thoroughly together, add to them four well-beaten eggs. Butter well a deep dish and place the mixture in it; put in a good oven, bake until quite brown on both top and bottom, and as soon as done turn it out on a platter and eat hot with a wine or lemon sauce. If preferred cold, it is also very nice in that way. Make a sauce for this pudding as follows: To one and a half cups of water add a half-cup of wine or the juice of two lemons, and a small stick of cinnamon; sweeten to taste, and let boil for a few minutes. Then beat well three eggs and stir the sauce into them—not the eggs into the sauce, otherwise the mixture will curdle. Stir all the time while mixing. Put back on the fire after mixing, still continuing to stir until it thickens.

CONDENSED MILK.

SOME PRACTICAL RULES FOR JUDGING OF ITS QUALITY

The general appearance when poured from a spoon should be glossy; the more glossy, the better. It should be ropy or stringy like very heavy syrup. The color should be that of cream, but the color varies according to the season of the year in which the milk is condensed, the same as milk not condensed varies in color. Milk is more yellow in summer, when cows are on pasture, than in winter, when they are fed on dry hay. Thickness varies with age. Thickening by age is natural to condensed milk; rapid thickening only proves that the milk is preserved in the best manner, and that it retains in the highest degree characteristics of milk in its natural state. Condensed milk which does not thicken by age, or which thickens very slowly, is milk abused in the process of condensing. Consumers make a great mistake in supposing that the thinnest condensed milk is the best. The thinnest condensed milk contains the most water, and, of course, less of milk solids or milk nutritives. The thickest condensed milk,

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. MCGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

PROVIDENCE, R. I.

BEWARE OF SUBSTITUTES AND IMITATIONS.

Caution:—Be sure the word "Horsford's" is *printed* on the label. All others are spurious. Never sold in bulk.

if in sound condition, is the most valuable. There is a degree of thickness, however, that is inconvenient. If condensed milk is so thick that it will not run out when an opened can is inverted, it is troublesome to dissolve. If it is not actually hard, very little stirring in the can will render it sufficiently liquid for convenient use Condensing milk, if properly done, does not destroy cream globules, but leaves the constituents of milk unaltered and natural. One method, therefore, of determining the relative quality of different samples of condensed milk is to ascertain the amount of butter that can be made from each.

OLIVES.

HOW THEY ARE PICKLED IN ITALY.

Mr. L. Paparelli, who came last year from Italy to assist Professor Hilgard in the experiment station at Berkeley, has prepared a statement for olive-growers in California concerning the methods of pickling the fruit employed in Italy. The olives must be picked by hand some six weeks before they reach maturity. The usual process is to steep them in a solution of caustic soda at the rate of about five ounces to a gallon of water. After soaking a few hours, soft water is poured upon them several times until it flows away clear, when the fruit is placed in kegs of brine consisting of one ounce of salt and thirteen ounces of water for each pound of olives. When they are preserved without lye, the olives are placed in a wooden vat and submerged in pure water covered with lemon leaves. The liquid is changed every hour for a month, after which the fruit is placed in vats, with first a layer of salt, then one of olives, then salt again, the proportion being twelve pounds of salt to a hundred pounds of olives. After remaining in the salt for two days clean water is added, and another layer of an inch of salt is placed on top, and in a month after this treatment they are fit for use. The olives

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable*."

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

are improved by placing aromatic herbs like fennel among them after the first treatment.—*Garden and Forest.*

BUSINESS NOTES.

DEAN'S ARDENTER MUSTARD.

The best known house in the mustard trade of this country is that of W. G. Dean & Son, whose factory occupies a large building at the corner of Washington and North Moore Streets, this city. The house was founded by J. D. Herron and William G. Dean, in 1852. Mr. Herron had been engaged in the manufacture of mustard in England for twenty years previously. He operated a very large factory in London and sold its products all over Europe. In 1851 he sent for a number of samples of American-made mustards and found them decidedly inferior to those of English manufacture. This discovery satisfied him that there was an opening for the manufacture of good mustard in the United States. He sold out his London business and transferred his capital to his country. Capt. Ludlow, the chief officer of the steamship Ariel, one of a line owned by Commodore Vanderbilt on which Mr. Herron came to this country, brought Mr. Herron and Mr. Dean together. The latter was then associated with the old established clothing house of Brooks Brothers, who were at that time located on the corner of Water and Catharine Streets. The result of their introduction was a proposition made by Mr. Herron that the two should enter into the manufacture of mustard by the old English process, which had been so successful in Europe. This consisted of drying the mustard seed in a kiln until the fixed oil had been thoroughly dried out. Then it was passed through steel rollers and the flour separated from the bran by the old style bolting-cloth sieves. Afterwards the flour was allowed to stand for six days in large boxes in order that the chemical action set up by exposure to the atmosphere might darken the flour to the regulation hue. Herron and Dean were successful from the start in placing their goods with many of the large jobbing houses in New York, Baltimore, Philadelphia and the New England cities. In the summer of 1854 Mr. Herron died. Mr. Dean bought out the interest of his deceased partner's widow and continued the business in his own name. In 1855 he invented an improved process for separating the mustard flour from the hulls or bran, which saved a great deal of labor. This consisted in putting about two thousand pounds of mustard seed into large vats and allowing it to soak there for twelve hours. Afterwards it is put through the processes above described. Owing to the soaking thus received the bran is much more easily removed from the flour—in fact a saving of 60 per cent. in labor is made. In 1860 Mr. Dean made still further improvements in the process of manufacture. By these means the fixed oil is separated from the essential oil by hydraulic pressure This fixed oil is very valuable as a condiment for salads and for use in feeding signal lights in very cold climates where other oils chill and thicken. In 1870 he invented a third process for manufacturing mustard by heat, which has proved very valuable, and is protected by patents granted by the English and American governments. Mustard manufactured by this process will keep in any climate. It is the variety so generally known as Dean's Patent Ardenter Mustard. The flour is cooked in a kettle provided with a jacket filled with live steam. Thus every particle of moisture is expelled from the flour, and when properly cased it will keep indefinitely, even at the equator. No other mustard made has this quality. In 1877 Mr. Dean added the manufacture of mass and stick licorice to his business. His inventive genius enabled him to make many improvements in this branch. In consequence, the business grew so rapidly that for more than a year past the firm have been from sixty to ninety days behind their orders. Their pure Calabria, branded D. & S., is made from the finest imported Spanish mass. Besides the D. & S. Calabria they also manufacture several other brands of stick licorice, also various kinds of licorice lozenges and tablets for the druggists' and confectioners' trade. They also sell to the former trade root licorice in bundles of various weights.

DISEASE VEHICLES.—The French medical journals have lately told of another instance in which diphtheria appears to have been transmitted from animals to man, this time from pigeons. One of these birds died, and the veterinary surgeon found post mortem that diphtheria had been the cause of death. From this bird, his owner, his daughter and a child were infected.

GAS AND ELECTRICITY.—The plan of using gas in small electric arcs to increase their power at a less expense than that of extra current has been effectively carried out by means of hollow carbons. An added cost of 6 per cent. is said to give in this way a light equal to one and one-half times that of the ordinary lamp.

RUSSIAN DOCTRESSES.—Russia now allows female physicians to practise in all parts of that empire. They will wear a badge of their profession, and can practice in female schools and institutions admitting women, in similar institutions of the Zerustvos, and are especially exempted from calls as experts to attend criminal trials.

QUEER LAW.—The *Alabama Age* states that the law regulating registration in that State was so curiously worded that, though the Supreme Court has decided that illegal practitioners are criminals, they cannot be punished. An effort is being made to remedy this omission, but is opposed by the practitioners who do not belong to the regular school.

SOAP FROM CORN.—It is claimed that an eastern chemist has discovered a process of making soap from corn. The discovery has excited considerable attention, and promises to give not only a new corn market but to revolutionize the art of soap-making. The soap made from corn is said to be absolutely pure, and better than the finest toilet soaps made.

ARTIFICIAL TIMBER.—An invention which is designed to supplant nature is a substitute for white pine. The rapid disappearance of the white pine is a solid fact, and it will not be many years before such an invention will have a practical value. The substitute for timber, as indicated, will be found in smaller trees, reduced to pulp; and pressed in moulds into the sizes and shapes wanted.

MICROBES IN HAIL.—The *British Medical Journal* states that Dr. Fontain, a Russian observer, has recently demonstrated the existence in hailstones of pernicious microbes or microscopic organisms. The water resulting from the melting of the stones used in the experiments yielded an average of 729 bacteria to the cubic centimeter (a volume about the size of a small marble). Nine different forms of bacteria were discovered, including the bacillus mycoides.

OZONE.—An electrician the other day said: "A simple and almost perfect method of purifying the atmosphere of crowded apartments, such, for instance, as railway cars, is to produce ozone by electrical sparks, and the practice has been strongly recommended by the highest medical authorities. The delightful freshness and vigor which is perceptible in the air after a series of sparks from an ordinary influence machine is a proof of the salutary and refreshing influence produced.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Jan. 12, 1891.

The following are the market prices to-day at New York.

	New York.
Fancy Hay	65c. @
No. 1	60 @
No. 2	55 @
No. 3	50 @
Shipping	45 @
Clover mixed	45 @ 50
Clover	40 @
Prime Rye Straw	90 @
No. 2 "	75 @ 80
Oat and Wheat	45 @ 50

Receipts week ending Jan 10, as follows:
Via N. Y. Central, 145 cars.
" West Shore, 153 "
Total, 298 cars.
From other roads by Lighter to 34th Street, 6 cars.

The market has undergone a decided change for the last few days. Trade has shown more activity, and the accumulation of stock mentioned in our last issue has been about cleaned up. The receipts at present are moderate and demand equal to the supply, except hay in perpetual bales, which is in poor demand, and selling slowly at fully $1.00 per ton less than large bales of the same quality. Our highest quotation is 65c., but a strictly fancy article would probably bring 70c. should any of that description come forward just now. Other grades are firmer, with a very slight advance in price, and unless the receipts become heavier the outlook is more encouraging.

Rye straw in good demand at prices quoted.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$14.50 to $15.00
Hay, choice to fancy, perpetual pressed bales	13.00 to 14.00
Hay, fair to good	12.50 to 13.00
Hay, poor to ordinary	10.00 to 12.00
Hay, Clover and Clover mixed	10.00 to 11.00
Hay, swale	9.00
Straw, Rye, good to prime	17.50 to 18.00
Straw, Oat	9.00 to 10.00

BOSTON, Jan. 10th, 1891.

Receipts for the week are 389 cars of hay and 26 cars of straw; corresponding week last year, 201 cars of hay and 23 cars of straw. Receipts for the past week have been large and the stocks unsold have accumulated. The market is quiet and weak. Quotations are somewhat nominal, as prices would be shaded if free sales could be effected thereby. Rye straw is very firm; some sales are made at $18.50.

GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens, in Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

All New Subscriptions sent now will be good until January, 1892.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

AMERICAN PORK IN FRANCE.

The French Chamber of deputies is considering a proposition imposing an import duty on lard of fourteen and twelve francs, according to quality. This action indicates that one more step has been taken towards the readmission of American pork products into France, from which country they were absolutely shut out by the decrees of February, 1881, and December 27, 1883; those decrees having continued in force ever since the latter date, except for a short interval in 1883, when the products were allowed to pass through the Custom House. Heavy duties have been placed upon the products, as was to be expected. But the main or rather the only object sought to be attained has been the readmission of American pork products into France, thus freeing them from the imputation of unwholesomeness, which has injured them in the opinion of other European countries. That was the only point laid down in the diplomatic documents and explanations sent by the United States Minister in Paris to the French Government; and it appears that this policy has been successful, at least in regard to the Customs Committee of the Chamber of Deputies, which some time ago adopted a schedule of duties on hams, fresh pork, and other products of the American hog. The duties are certainly rather high, but that fact increases the probability that they will be voted by the Chamber, and will be lowered after the present ultra-protectionist mania shall have disappeared from French minds. It seems that the great point at issue, the repeal of the prohibitive decrees, and the readmission into France of the American hog, slandered and shut out for the last ten years, has been accomplished.

THE ELECTRIC MOTOR.

The universal application of electric power to practical uses was recently summed up graphically by a writer in the *Sun*, who says: "In some cities, so far has the use of electric motors gone, that it is possible for a man to-day to drink at breakfast coffee ground, and eat fruit evaporated, by electric power. During the morning he will conduct his business with electrically made pens, and paper ruled by electricity, and make his records in electrically bound books, his seventh story office, in all probability, being reached by an electric motor elevator. At luncheon he will be able to discuss sausages, butter and bread, and at night eat ice cream and drink iced water due to the same electrical energy. He will ride all about the place in electric cars, wear shirts and collars mangled and ironed by electric motors, sport in a suit of clothes sewn and a hat blocked by the same means; on holidays ride a merry-go-round propelled by an electric motor, or have his toboggan hauled up the slide with equal facility; be called to church by an electrically tapped bell, sing hymns to the accompaniment of an electrically blown organ, be buried in a coffin of electric make, and, last of all, have his name carved on his tombstone by the same subtile, mysterious, all-persuasive and indefatigable agency. This may sound like a wild and exuberant flight of fancy, but it is simply a faithful statement of the manner in which electricity is being applied to every one of the necessities and luxuries of life in America."

THE VALLEY OF DEATH.

There is a region somewhere in Colorado known as the Death Valley. It was recently reported from Washington that the Secretary of Agriculture is engaged in organizing an expedition for its exploration, the locality being a veritable *terra incognita*. The heat there is so intense that dead animals do not decompose. Water in the valley is unknown, and the expedition will carry water and food for mules and men. It is a question whether the animals will be able to survive the expedition. Two of the chief botanists of the department are at present working their way into the valley from southern Nevada, while another expedition is on the march from southern California. The two expeditions are expected to meet, if nothing goes wrong with them, at a point previously decided upon in the valley. Professor Merriam will take charge of the expedition. There is reason to believe that there are rich gold and silver mines in the region named. A story is told of an adventurous miner who some years ago penetrated into the valley and found the skeleton of a miner. A wooden pail was lying near it, and in it a chunk of gold of great value. On his return to California he showed his find to a group of miners. Their cupidity was so excited that, other means failing, they tortured him to make him confess where he had found the gold, believing that he had discovered a gold mine, the location of which he would not reveal. The scientific men with the expedition will map the country and procure specimens of such animals and insects as exist there, if any do exist. Secretary Rusk regards the expedition as of great importance.

GOOD COOKERY.

Cooking, as a practical process, is as laborious as it is necessary, and though not sufficiently appreciated as an art, it is nevertheless one that requires more talent, tact and qualifications than many accomplishments the possession of which may seem to make the possessor appear more brilliant and attractive. To be a good cook does not always compel actual practical labor at the range, though a good cook can only acquire this quality by practice; but possessing the requisite knowledge, it makes the possessor at once independent, and able to command assistants and servants, and intelligently to superintend and manage the household. At first sight it appears very easy to cook food, but when all the conditions essential to the task are considered, it will be seen that a good cook has a field of operations wherein there is no end to possibilities of discovery and invention, where all the elements of nature have to be contended with, in which all the human senses have to be pleased, while a continued change of nature's production is constantly taking place. In truth, success depends upon a great number of external circumstances apparently beyond our control. Nevertheless, it is a fact that those who possess natural taste for the work, and have a love for order, punctuality and cleanliness, may quickly learn to be good cooks; and as in all other things so in this, practice makes perfect. It is true that the practical art is more quickly learned by actual practice, yet it is important for a good cook to know of what the material to be used is composed, and how the nutritious portions can be best preserved and brought into use. This attainment requires study and theoretical knowledge. For instance, rice and beef are both nutritious substances, yet being different in their chemical composition, require different treatment; for what would

help the nutritious qualities and the palatableness of one might do the very opposite for the other. There is much to be learned in this branch; books are the keys which open the door of knowledge. A thorough understanding of a subject removes false impressions and replaces them with correct and positive information. We can learn what and how much nature supplies for our proper food, and how we can best employ art and knowledge to assist nature in her beneficent mission. It will be seen what a precious jewel the possession of a theoretical and practical knowledge of cooking is. If we had more housewives possessing this knowledge, we would have many more happy, contented households, and much less dyspepsia.

ROPES.

WHAT MAY BE SEEN IN A LARGE CORDAGE FACTORY.

The December issue of the *Cordage Trade Journal* contained an interesting description of a factory in Brooklyn, from which we condense the following: When the hemp is unpacked from the bale in which it has arrived the first process it goes through is the oiling. This is done by two machines, which are capable of oiling 30,000 pounds per day. Each of these machines consists of a row of ten fluted rollers, outside of which at the beginning and end are steel cylinders. The first cylinders receive the hemp as fast as a man can throw it in front of them, and they pass it to the fluted rollers under a stream of oil, which flows from a tank on the cylinders. As the fibres rush swiftly along the fluted rollers work the lubricant in and the hemp comes out at the end pretty thoroughly oiled. Then it goes to the scutching machine, the work of which is to clean and separate and straighten the tangled fibres to a certain extent. This scutching machine is a big wooden cylinder, three or four feet broad and about eight feet in diameter. It is covered with thin steel spikes four inches long; these spikes are set with a downward declination, so that as they are carried upward on the cylinder they do not catch the hemp squarely on their points, but rather scratch or scutch it. This process is quickly performed A handful of hemp is thrust in, the spikes scratch it for a few moments, it is then withdrawn and thrown on the floor ready for the next process, which is that of spreading. The spreading machine is a curious one. It consists of two endless bands, called chains, each about two feet wide, set end to end in a framework of iron. The whole face of each of these bands is covered with similar spikes to those on the scutching machine. As the hemp enters through the steel cylinders to which it is fed, the upright spikes upon the first of the endless bands catch hold of it and carry it slowly along until it reaches a point in the middle of the machine, where the spikes of the second band seize it. This second band is traveling about ten times as fast as the first one, and the consequence is that when it catches the hemp it draws it swiftly away from the first band, straightening out the fibres and evening it—that is making the thickness equal. The hemp goes through other spreading machines before the fibres are sufficiently straight and disentangled to be fit for spinning. The spreaders also perform another duty as the hemp passes through them: they comb it out to as fine a thread as is needed for the twine, cord or rope to be made.

When the straightening and spreading have been successfully accomplished, and the hemp is reduced to a thread of the required thickness, it is taken to a spinning-jenny, where it passes through a nipper and over capstans and into a flyer. It gets a twist in it here and passes on to a bobbin in the jenny which reels it up very swiftly. When it leaves this jenny it is a yarn fit to be used for any kind of rope or twine. The threads or slivers of hemp can be made of any thickness, the spreading process controlling that. If they are to be used for rope they usually run about 300 feet to the pound, and 600 feet to the pound for twine.

The general idea of a rope-walk is a large, low shed, built on a country meadow, where land is cheap and the railroad near enough to carry the product to the large cities. When a rope-making concern decides to do their work in a city, it is very evident that a long, low building would need a strip of land worth many thousands of dollars, and for this reason Messrs. Tucker & Carter decided to make their rope where the right of way could be secured at a much lower figure, and their idea was carried out by tunnelling under the high-priced surface of the city earth, where buildings could be put over their burrow. Longfellow wrote of the rope-walk:

"In that building long and low,
With its windows all a-row
Like the portholes of a hulk,
Human spiders spin and spin
Backward down their threads so thin,
Dropping, each a hempen bulk."

In the days of which Longfellow wrote ropes were made by man power. The rope-maker wound the hemp about his body, and walking backward twisted the strands as he moved away from the bobbin which held the hemp. This bobbin was usually held by a boy, and when all the hemp was unrolled the boy would knot the end to a new thread and keep the workman constantly supplied with material. The name rope-walk was in those days in no sense a misnomer. Man power was afterwards replaced by horse power, and about the year 1850 steam power was utilized for the first time. The rope-walk of the Tucker & Carter Cordage Company is a tunnel 1,200 feet in length. This tunnel is lighted by windows set in the side, for the earth on each side has been dug away from the low brick building, and a wall of bricks, removed about four feet from sides of the walk, follows its course throughout. Down in this well-lighted tunnel the men who make ropes work. Their apparatus consists of an iron car, on the rear end of which a drum is set upright. From the circular face of this drum hooks project, forming a ring around this rim. From a number of bobbins set in a stationary frame threads are connected to one of the hooks, while, may be, another of the hooks, or perhaps two others, are similarly employed. Then the car carrying the drum in which the hooks are set is started, and retreats away up the rope-walk, pulling the threads from the bobbins as it goes. Each hook is then seen to be nothing less than a swivel, which turns swiftly, twisting all the threads on each hook into one strand. These strands can be made of any thickness, according to the number of threads used in them, but no less than two threads will form a strand for rope-making, and often as many as a hundred are necessary. Three of these strands form a rope, the thickness of which, of course, is altogether governed by the thickness of the strands. In twisting, the rope loses about twenty per cent. of its length, and comes out little more than 1,000 feet long. If greater length is needed, it is necessary to use big machines, which the factory employs for that purpose. They are stationary, and they reel up the rope as fast as made. The largest ropes made here are about four inches in diameter, but if anything bigger were required it could be turned out. These big ropes are used for cables for the larger vessels. They are tarred by the threads which compose them passing through a trough in which boiling tar is foaming. Small ropes, such as clothes lines, are made by machines called formers and layers. A number of yarns from a frame of bobbins pass into the former, which twists them into a strand which is afterwards taken to the layer, where it is united with two similar strands and twisted into a rope which is reeled up as fast as made. This process also is the one by which all three-strand cord is made. Beside the main building, in which only harvest twine is made, there is a rope factory for small rope, a building where the jute is worked, another for the sisal, a blacksmith shop, a well equipped machine shop, where the firm repairs all machinery; a tar-house, where ropes for vessel rigging are tarred; a stable, several storehouses, and the rope-walk. Some of these buildings mentioned are almost as large as the main building, and, together, they make up quite a town. At present, if all the departments of the factory are working to their fullest extent, they can produce twenty-five tons of harvest twine, twelve tons of rope yarn, and five tons of jute yarn per day. It takes 270 jennies with 540 spindles to do all the work required. Two engines, one of five hundred and the other of three hundred horse power, run the machinery throughout the premises. All sizes of twine, cord and rope are made in the manufactory mentioned, but the harvest twine leads the way in point of quantity. Its manufacture was only begun in 1880, five hundred tons being the total output of it for that year. In the brief time which has elapsed since then it has rolled itself into a wonderfully large business, as shown by the figures given above. It displaces wire, which was formerly much used for harvesting. Wire fastened the sheaves all right, but it had its drawbacks. It insisted on following the sheaf into many places where its presence was not an unalloyed blessing. It got into the mills, and, in fact, is accused of causing the great fires at Minneapolis by this trait. It also got into the cribs, and was eaten by the cattle, greatly to their edification, no doubt, and it likewise worked its way into the ground, and interfered with the farmers' ploughing operations. Many attempts were made to produce an article which would bind as well as the wire, and at the same time equal it in cheapness.

OIL AND LEAD.

A NEW COMBINATION OF COTTON SEED OIL AND MOLTEN LEAD.

In a suitable metallic vessel of something more than one gallon in capacity is placed one gallon of pure cotton seed oil. There are now melted in a furnace in a suitable crucible or ladle twenty pounds of pure lead metal, care being taken that the entire quantity of the lead is in the molten state, which will insure a temperature thereof of not less than 334 deg. of heat Centigrade. In this molten state the lead is then poured gradually in the one gallon of cotton seed oil, care being taken that the mixture is well stirred during the process of pouring, in order that, as far as possible, each molecule of the molten lead will be exposed to the action of the cotton seed oil. In this process of pouring the molten lead, as soon as the hot and molten metal strikes the surface of the oil, it follows the law common to all molten metal when thrown in a liquid and separates into very minutes globules, the bright and pure surfaces of which are brought in immediate contact with the cotton seed oil, and by the heat therefrom impart such affinity to the cotton seed oil in immediate contact therewith that a certain part of the lead will be absorbed by the cotton seed oil, which, when removed from the influence of the heated globule of lead, will immediately cool sufficient to retain therein the lead thus absorbed. When the entire twenty pounds of molten lead have been thus poured in the gallon of cotton seed oil, it is allowed to remain some little time to cool off, after which the oil is drawn off, and there will be found remaining in the bottom of the vessel in various forms about seventeen pounds of the pure lead, thus showing that in this one process of pouring about three pounds of lead have been absorbed by the one gallon of cotton seed oil. The remaining seventeen pounds of lead is now removed from the vessel, and the gallon of cotton seed oil, that has now about three pounds of lead therein, is returned to the vessel. The remaining seventeen pounds of pure lead is again heated and brought to the molten state, in which condition it is again poured in the cotton seed oil contained in the vessel, the same care being observed in stirring the mixture during the process of pouring as in the first pouring of the metal. After this second process of

pouring the molten lead in the cotton seed oil the mixture is allowed to cool sufficiently, when the oil is again drawn from the vessel, and there will now be found remaining about fifteen pounds of pure lead, thus showing that in this second process of pouring the molten metal two pounds of lead additional have been absorbed by the cotton seed oil, which will now contain about five pounds of lead combined therewith. This process of remelting the remaining lead, and again pouring and mixing it with the same cotton seed oil is continued with advantage up to the fifth time of pouring the molten metal, after which the cotton seed oil will be found to have absorbed about ten pounds of the lead, after which there seems to be no further affinity of the oil for the metal. As soon as the cotton seed oil has been brought to this stage it is allowed to thoroughly cool, when its consistency will be about that of ordinary paint. The compound is now in condition to be applied to those surfaces that it is desired to protect against corrosive or deteriorating influences, and may be applied with a sponge or brush, as in the application of ordinary paint. In applying the compound its adhesiveness will cause it to adhere tightly to the surface coated therewith. It is preferred to apply one coat and then allow it to remain about forty-eight hours, during which time it will have become sufficiently hard to resist ordinary abrasion, and after which a second coat may be applied with advantage. Philip Helbig and Hermann Bertling, of Baltimore, Md., are the authors of this new article and process. They say: "It has been found in practice that no other of the known oils, other than cotton seed oil, possesses the quality of absorbing the lead when treated as herein described, and that the cotton seed oil possesses the quality of absorbing certain proportions of other metals when poured therein in the molten state in the manner herein described. As stated, the compound may be employed to protect metallic surfaces of any kind, and is claimed to be particularly useful for coating the bottoms of iron or steel ships to protect the surface thereof from rust and the adherence thereto of barnacles and other marine life. It is likewise of equal benefit for the protection of wooden surfaces that are to be buried in the earth or exposed to the action of water —such as fence-posts, piles, etc."

HEALTHFUL HOMES.

SOME GOOD ADVICE ON AN IMPORTANT THEME.

A cemented floor under the whole area of a house is a sanitary necessity, because the "air in soils" is more or less impure at best. There is no excuse for building underground apartments in the country. They are never wholesome anywhere, and if families are compelled by stringent reasons to live in the city, where basement dining-rooms and underground kitchens are the rule, they should endeavor to have an upper sitting-room and live in it as much as possible. The very placing of a house on any ground and living in it, under ordinary circumstances, causes suctions into its interior of impure soil air, because the air of the house is warmer than the air beneath it, and this induces a rush of the cold air to the warmer house atmosphere. The concreted floor will, in a great measure, do away with this difficulty, but not altogether. Ventilation of cellars must, therefore, be attended to, no matter how clean and perfectly built they may be, in town or country. Annual lime whitewashing, an old custom, is decidedly a wholesome precaution, and every cellar should thus be treated, especially in the autumn, as the cellar will be kept closed more than in spring and summer. Very important are the floors, woodwork, walls, and ceilings of a house. Their condition influences in a greater degree than might be imagined the health of the family. There cannot be a doubt that papered walls are not wholesome, that is, if the paper is of the ordinary kind in use, which is highly absorbent. There is a paper made, I think, in England, called "sanitary paper," which has a finely glazed surface, which may be scrubbed without injury to its texture or colors. This paper is probably as free from the objection named as any texture could be. This paper is much wider than the ordinary wall paper, and as it is very strong and durable, does not cost more in the long-run than ordinary wall paper, even if the first outlay is more than that expended for the less expensive grades of ordinary wall paper. Painted walls are the best for all living rooms, that is sitting-rooms and bed-chambers. They are also best for dining-rooms, where there are always so many odors of food to absorb. Stained and varnished woodwork or else painted woodwork should rule, as neither is absorbent. The floors, especially, should never be left in the natural state, and I should advise all builders of houses to have their floors painted before living over them, where they are to be carpeted or otherwise covered, and stained and varnished where the intention is to show a portion or all the surface. These measures, renewed as wear necessitates, will prevent your house attaining that peculiar smell which is associated with old boards almost invariably, no matter how often or how vigorously they have been scrubbed by the neatest housewife. Part of this smell, indeed all, is due to the decay of absorbed matters, which in some cases include disease germs. Paper may be varnished, however, and thus rendered non-absorbent. As it is not the privilege of every one to move into a perfectly new house and do just as they please, one must say a word to those who, unhappily, are obliged to live in houses of other people's building and ownership. To insure healthy conditions in an old house, go to work and do all possible cleaning with soap and soda and water. Strip down all old papers from the walls. Sometimes there will be found as many as six different layers of dilapidated paper of different colors and designs. To remove old paper, wet it all over with a damp cloth from time to time, so that the water will soak through, and in an hour or two it will be so loosened that one may peel off the layers with comparative ease. The walls should all be washed down with soda and water, and it will be well to add a little carbolic acid to insure the better purification of the apartment. The ceilings, too, are very important, and should, if possible, be painted, or at any rate thoroughly cleaned and given a fine coat of tinted lime-wash. Loosely laid floors become a source of evil smells, and a hiding-place for vermin and disease germs. Hence it is well worth the expense to have new floors tongued and grooved and blind-nailed, and old floors taken up, planed, and relaid, blind-nailed, then painted with two coats of paint. Old floors, having finished their shrinking, will not again give any trouble by reason of open seams to collect dirt and noxious substances.

AGATE AND ONYX.

SUPPOSED ORIGIN OF PEECIOUS STONES OF COMMERCE.

Geology has been a revelation to mankind, and has told us wonderful things of the past history of the earth; but geology has secrets of its own that are as hidden from comprehension as the atmosphere of the moon or the belts of Saturn. Certain things have been done, says the geologist, through volcanic action or the agency of fire, and that is as near as he can come to it; so that, after all, we see effects, but know little or nothing of causes. There is a rock known as amygdaloid, one of the igneous rocks, which in some of the gigantic transformations of nature, we will say in cooling from a melted state, formed within itself cavities from the size of a marble or bead to that of the closed hand. Now, as nature abhors a vacuum, she sets to work to fill these cavities, and in doing so she used other materials, and these combinations produced some of what we call the "precious stones of commerce." Exactly how this was done we cannot tell, but we see some hint of the operation in every subterranean cave where stalactites and stalagmites are found. Every student knows that this is the result of dropping water which contains carbonate of lime. The water evaporating leaves a minute particle of lime, which takes something to itself from the earth or atmosphere, and in the course of ages bodies have formed of a most remarkable character. In probably somewhat the same fashion have these cavities been filled in the igneous rocks, and then comes time and storm, and other agencies, earthquakes, perhaps, and the rocks are rent apart, and out drops a bead or a bowlder, and a curious man picks it up, and hammers and breaks it, and then he puts a polish on it by some process more or less advanced, and lo! he holds in his hand an agate or an onyx. Many of the stones used in the arts have no other origin, and are deposits of silica, alumina, oxide of iron, and other coloring substances. It is the color or arrangement of colors that gives the name, and thus we have agate, onyx, chalcedony, carnelian, sard, chrysteloprase, sardonyx, and others, all members of the quartz family, and all having a family resemblance. The agate has veins of different shades of color in parallel lines. Sometimes these are very close together, as many as fifty to the inch, but this is unusual. When there are alternate bands of color and a transparent medium we have the onyx, but the latter may be obtained by cutting the stone in a differeut way. Agates are used chiefly for ornamental purposes, such as cups, seals, rings, handles for parasols, table and mantle ornaments, but the material is so hard that it can only be worked by those who have practiced skill. The onyx was valued by the ancients for its application to cameos and intaglios—the first an object in relief, the latter a "cut-in" process; and these objects are still made. Nature produces some very strange forms occasionally, and agates are found with exact resemblances of moss and other natural objects and figures, which are very curious and often very valuable.—*The Great Divide.*

HYALINE.—A "horny, translucent, plastic composition of great tensile strength and considerable elasticity, which may be used as a cheap and inodorous substitute for celluloid, and can be worked, dyed, pressed, denitrated, and rendered incombustible or fireproof." "Hyaline" is a mixture of about equal parts of gun cotton and colophony, or shellac, copal, dammar, turpentine, or of any mixture of these resins.—*F. Eckstein, Plastic Compositions.*

AMERICAN ILLITERACY.—In our country three-fourths of the nation's illiteracy is in the South. Forty per cent. of the whole population of the South cannot read the New Testament. Of the 2,000,000 illiterate voters in our country, 1,500,000 are in the South; The negro population, now about 8,000,000, increases at the rate of 500 per day. Among the more than 2,000,000 mountain whites in the South one-half cannot read. Of the 50,000 Indian children, less than 15,000 are in school. The Chinese in America are few, but they represent one-third of the population of the globe.

A RED NOAH.—The present Messiah craze among the Indians of the North, West and Northwest revives interest in anything that pertains to the queer delusions and beliefs that have been rife among the different tribes for the past century. It is remembered now that in 1883 the Saupoels, a small tribe in what was then Washington Territory, became greatly agitated over the teachings of an old chief who professed to believe that another flood was near at hand. He said that the Great Spirit had commanded him to collect tribute and build an ark that would outride the waves. His great canoe, 112 by 228 feet, is still to be seen in an unfinished condition near one of the tributaries of the Columbia.—*St. Louis Republic.*

PINEAPPLE FIBRE.—Still another textile material, says an exchange, bids fair to rival jute. This time it is the pineapple fibre, and R. Blechynden, of Calcutta, is attempting to awaken interest to the great economic value of this product. The pineapple has long been cultivated for its fibre in India, while it is manufactured into a cloth in the Philippines and woven into linen in China. But more recent investigations show that when subjected to the process of bleaching, the fibre becomes pliant enough to be spun like flax and by the same machinery. The fibre can be subdivided into threads of such delicacy as to be barely perceptible and yet sufficiently strong for any purpose.

VEGETABLE BUTTER.

A SINGULAR PRODUCT OF THE COCOANUT.

A recent number of the *Kew Bulletin* contains an article on cocoanut butter, a valuable edible fat prepared from the kernel of the cocoanut and recently introduced into commerce. It is a white, odorless, almost tasteless fat, which solidifies at about sixty-five degrees Fah., becoming above that temperature a pure white oil. "If cocoanut butter can be prepared, as is suggested, from the ordinary 'copra,' or dried kernel of the cocoanut, as shipped from tropical countries, there would be an almost unlimited supply of the raw material available from various parts of the world." According to Dr. Zerner, of the Royal Imperial and General Hospital in Vienna, "The cocoanut butter, which, on account of its low melting point, is exported in tins, furnishes a pure white transparent mass of the consistence of lard, without granular texture, which at a temperature of seventy-nine degrees Fah. melts to a clear fluid and solidifies again at sixty-seven degrees Fah. It has a slight agreeable smell, melts on the tongue, leaving a mild but in no respect acrid taste behind it. In ether it dissolves completely. If the ether is evaporated over water, and distilled water is added to the residue, the solution gives a neutral reaction. I have often repeated this test with cocoanut butter which had remained open for days (fourteen days), also with pharmaceutic preparations eight to fourteen days old, in the preparation of which cocoanut butter had been used. The cocoanut butter is, therefore, free from fatty acids, and even if left open for the space of eight to fourteen days does not turn rancid, with the exception of the top layer which comes in contact with the air. With regard to its chemical composition, cocoanut butter differs from most other fats, and particularly butter, lard, and margarin. In its fatty constituents, and the amount of volatile fatty acids, it stands next to butter among solid fats. Cocoanut butter differs from all other vegetable and animal fats by its saponification degree (258.5 according to Rud. Benedikt in Vienna), and on account of this high saponification degree all adulteration is impossible. Artificial digestion tests seem to show that the cocoanut butter exercises no injurious influence whatever over digestion. The next point was to ascertain how the cocoanut butter stands with regard to micro-organisms. It is well known that in this respect milk butter is very far from perfect, as apart from the numerous germs, which for the most part are not pathogenic, that may be introduced during its preparation, and the microbes already present in the milk itself, this article of food affords an excellent nutrient fluid for a large number of micro-organisms. It follows that although in any given case other ways and means of infection may be excluded, this may still take place through the agency of milk and butter. The possibility of a transfer to the human consumer of the tubercle bacillus, as well as of other micro-organisms, which have got into the milk from animals suffering from infectious diseases, is in the case of cocoanut butter a vegetable fat, excluded from the first. Cocoanut butter has been proved by our investigations to be both free from germs and also to be a very bad nutrient medium for micro-organisms. Even when agar-agar or Ceylon moss (*Gracilaria lichenoides*) was mixed with the cocoanut butter, and then allowed to remain open, the number of germs was found to be less than in agar-agar without the mixture of butter. One more experiment may be mentioned. If sterilized milk is added to cow butter and kept at a warm temperature, the milk coagulates in twenty-four hours, proving the presence of bacteria in the butter. This coagulation does not take place if, instead of milk butter, cocoanut butter is added to the milk. From what has already been said, the conclusion may safely be drawn that the cocoanut butter, from a chemical and bacteriological point of view, meets all the requirements of a food substance. Our further investigations were directed to ascertaining whether cocoanut butter was suitable to healthly and sick people alike. Through a period of four weeks we distributed food to 116 patients in the form of pastry, roast meats, and farinaceous foods, in the preparation of which cocoanut butter was used in the place of fats. On account of this fat being almost free from water, one-quarter less may be taken, both in baking and cooking, than is generally used, if ordinary butter or lard is employed; and for the same reason it is necessary, in making pastry, to replace the twenty-five per cent. of water which the cocoanut butter contains, less than any other fat, by adding from seven to eight tablespoonfuls to about every pound of butter used. A little more salt must be added to the food, and the butter must always be heated before being used for cooking. Foods prepared in this way, as well as pastry, were always found to be eaten without any inconvenience whatever. The taste was undoubtedly pleasanter than in dishes prepared with animal fats. The statement of a colleague, Dr. H., is of particular importance in this respect. After recovering from disorder of the stomach he could not eat pastry without being afterwards troubled with pyrosis and cardiac pain. He could eat pastry prepared with cocoanut butter almost without any inconvenience. The experiments with patients proved cocoanut butter to be an easily digested fat, that causes no disorders in cases of impaired digestion. Of the 116 patients, among whom were individuals affected with every form of dyspepsia, not one complained of any discomfort, or of any ill effect after the consumption of pastry prepared with cocoanut butter, though pastry, as a rule, is not an easily digested food on account of the fat. In three cases where the pastry was partaken of an hour after vomiting, there were no ill results noticeable; on the contrary, a fresh supply was desired by the patients. We arrive at the conclusion that a fat has been found in cocoanut butter which meets all hygienic requirements, and which is far superior to animal fat and butter, as well as to any of their other substitutes. Further, on account of its being easily digested, cocoanut butter is particularly well adapted for the use of patients suffering from impaired digestion."

GLASS EYES.

HOW THEY ARE MANUFACTURED IN PARIS.

The Paris trade in glass eyes must be a very rich one, for every week there are nearly a thousand enamel eyes made in Paris. The important manufacturers, the scientific men, the artists of the profession, inhabit the Faubourg St. Honoré and the neighborhood of the Madeleine. They travel all over Europe, and transport their manufactures to St. Petersburg, Vienna, and even Constinople. The sumptuously furnished salons in which they receive their clients in Paris indicate connections among the wealthier classes. They generally select a one-eyed servant, replacing the organ of which he is deficient with one of the best articles of their manufacture.

When a client, a little frightened, perhaps, at the prospect of an operation, hesitates about confiding an eyelid to the instruments of the operator, the latter rings a bell, and Jean Polyphemus makes his appearance.

"What do you think of this fellow?" asks the operator of his client. "Study his features, and tell me frankly what you think."

"He looks well enough," answers the other, a little hesitatingly.

"Well, Jean, reveal your secret to this gentleman."

Whereupon Jean introduces a knitting-needle under his eyelid, removes his eye, and places it in the hand of the astonished spectator as unconcernedly as though it were a shirt-stud.

The cabinets of the larger Parisian dealers contain thousands of samples of eyes, all slightly varying, the one from the other. Some are small, others large, some black, others blue, hazel brown, light brown, bluish and greenish gray. There are laughing children's eyes, the liquid looking eyes of young girls, the languid eyes of middle-aged women, eyes with an amiable or sinister expression, severe official eyes, or the slightly filmy eyes of old men. Many of the French dealers, too, keep eyes which they loan out by the week or month, or even for special occasions; and there is a constantly accumulating stock of eyes which have been returned because they would not fit some fastidious customer. The manufacture of artificial eyes consists of three very distinct operations. Before the artist, who is seated at a table, is a lamp, the flame of which, blown by a bellows moved by the foot, gives a pointed jet of the strength he desires, and within reach of his hand are placed rods of enamel of different colors. He begins by taking a hollow tube of colorless crystal, one of the extremities of which, being soon melted by the fire of the lamp, forms a ball when blown. As the color given by the crystal has no resemblance to that of the sclerotica, usually called the white of the eye, the first labor is to color the ball in such a manner that it may be of the same tint as the natural eye. To attain this result he applies to the ball enamels of different colors, which, amalgamating with that of the crystal in a pasty state, gradually give it the natural tint of the eye. This obtained, he makes a circular opening in the centre of the ball destined to receive the pupil and iris. The artist begins on the iris, which is formed by the use of several amalgamated enamels. The iris finished, he places in its centre a spot of black enamel. This is the pupil, which he encircles with its areola, and he concludes by drawing those infinitely small fibres which are found in the iris. The globe of the eye being completed, it remains now to place it in the centre of the ball. Nothing is more simple. The hole made in the ball, which becomes the sclerotica, having been calculated according to the size of the eye globe, it is placed in it, and soldered by means of the lamp. This done, and the artist's finishing touches having rectified the small imperfections of the whole work, it only remains to pare this ball in order to obtain the eye shell. No mould of any kind is used, the breath and hand of the artist being alone employed. Each artist, by-the-bye, is persuaded that he alone possesses the best formula for producing the most limpid enamels, whose colors are most like those of nature.—*Chatter.*

PLATINUM.

ITS QUALITIES AND COMMERCIAL VALUE.

The market value of platinum is at the present moment nearly equal to that of gold, their respective prices being $20 and $20.75. Eighteen months ago platinum was to be had for about $7.50 an ounce, and six months ago the price was under $15. Apart from the question of a possible "corner," and the ever-increasing demand for platinum for electrical purposes, this 166 per cent. rise in price within eighteen months may be attributed in a large measure to the increased cost of production at the mines in the Ural mountains, whence we draw our chief supply of the metal. The owners of these mines, owing to their large yield of gold, were able to sell platinum comparatively cheaply; the gold, however, is now becoming scarce, and hence the platinum, which is still plentiful, can no longer be sold at so low a figure. Platinum, besides being used for the leading-in wires of glow lamps, is largely used for electrodes in electro-chemical work, and up to the present no satisfactory substitute for it has been found so far as these applications are concerned. The history of platinum is as interesting as its characteristics are remarkable. During the sixteenth century it was observed that the gold ore from the Darien mines included grains of a whitish metal. This discovery was not made known by the Spanish government, because it found that it furnished an excellent material for adul-

terating gold. It was only about the middle of the last century that the metal began to find its way into Europe. The Ural mountain deposits were discovered about 1823, and they have been worked by the Russian Government since about 1828. Platinum is generally found in small grains, but masses of considerable size have been discovered; thus in 1822 a specimen, which weighed 11,641 grams, from Condato, was placed in the Madrid Museum. Platinum was coined by Russia to the extent of half a million sterling between 1826 and 1864, when the coinage was discontinued. Almost all platinum contains iridium, which greatly increases its hardness and durability without impairing its power of resisting chemical agents. Liebig said that "without platinum crucibles, which share the infusibility of porcelain with the chemical inertness of gold ones, the composition of most metals could not have been ascertained, and chemistry could not have come to its present level." One of its most important uses is for large evaporating stills for the concentration of sulphuric acid. A still of this kind, valued at nearly $20,000, exhibited at Vienna in 1873, was capable of concentrating 20,000 pounds of sulphuric acid daily. This particular use for platinum has to a large extent been discontinued, and at one time the quantity of platinum thus set free caused a decline in its market value.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, geese.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

STEWED TERRAPIN.—Boil the terrapin; take out the meat and liver, carefully remove the gall, intestines and sand-bag. If there are any eggs save them, cut up the meat and liver and put them in a dish with the eggs; add a good lump of butter and seasonings of salt and cayenne, cover the dish and let it get very hot, then add a gill of fine madeira and serve.

A BOUQUET FOR SOUP.—Place in a bunch two sprigs of parsely, a leek, and a piece of celery; put in the centre of the bunch a bay leaf, a few cloves, some thyme and garlic; now double the bunch up so as to enclose the spices and tie with strong twine.

SWEETBREAD CROQUETTES WITH PEAS.—Boil four sweetbreads, chop them very fine and pound them to a paste, season with salt and pepper and add the yolks of two eggs, two ounces of butter and a tablespoonful of cracker crumbs; moisten with a gill of cream, roll it into balls or cork shape forms, dip these in beaten egg; roll in crumbs; repeat the last process and fry in boiling fat. Arrange a border of green peas around them and serve.

FRIED SWEETBREADS WITH TOMATO SAUCE.—Boil the sweetbreads; when cold cut them in slices. Dip the slices in egg and crumbs and fry in plenty of hot fat; arrange neatly on a hot plate, pour a thick tomato sauce around them and serve.

TOMATO SAUCE.—Stew a can of tomatoes with half an onion and four whole cloves. When quite tender remove the onion and cloves, and mash the tomatoes through a colander; add salt and pepper to taste and a cup of beef stock, and a teaspoonful of butter; thicken to the consistency of thick cream with flour, cook for a few moments and serve.

VEAL PIE.—Cut about a pound and a half of cold cooked veal into small pieces; cut up fine half a pound of ham or lean bacon; chop some parsley, a few mushrooms and a quarter of a small onion, and fry them in a teaspoonful of butter; season with salt, pepper and catsup; add a cupful of gravy or water and thicken a little with flour; boil up, remove from fire, add three teaspoonfuls lemon juice. Put a layer of veal in a baking-dish, pour some of the sauce over it, then put on a layer of ham, some more of the sauce, and so on until the dish is filled. Cover with a good crust and bake.

TAPIOCA PUDDING.—Soak as many tablespoofuls of tapioca in as many cups of milk as will be needed, for two hours, then add to it the yolk of an egg for each cup of milk, sweeten and add a little salt; pour into cups and bake for fifteen minutes, then serve with preserved peaches.

MOLASSES CANDY.—Two quarts molasses, two pounds brown sugar, one cupful cold water, one cupful butter; flavor with lemon oil.

KIRSCHWASSER.

THE DISTILLATION OF CHERRIES IN GERMANY.

The manufacture of kirschwasser is carried on very extensively in Switzerland and Germany. A great deal is distilled in the famous Black Forest and in other sections where cherries are plenty. The word, if literally translated, means cherry-water. For its distillation both black and red cherries are used, but the former are preferable, as they produce a spirit of finer quality. The cherry-trees are not specially cultivated, although, as the farmers realize more or less money from them, considerable attention is given to their growth and flourishment. The process of manufacture is something like the following: The cherries are first carefully cleansed, great importance being attached to that point; the stems are then removed, and the fruit packed in very thick wooden casks and left to ferment for a period of from five to eight weeks, according to the weather, after which it is ready for distillation. In large distilleries the stills contain ten or twelve hectoliters, while in the smaller ones the quantity varies from those figures to half a hectoliter. The large distilleries, with one or two exceptions, make use of indirect steam as means of heating, the stills being constructed with double bottoms, through which steam passes; the others employ naked fires, the fuel consisting of peat or the refuse of cherries and pears after distillation, which is compressed into bricks and dried. Both modes of heating have numerous advocates, who each claim the superiority of their system. Kirschwasser is put on the market in liter bottles, in carboys containing from 10 to 60 liters, and in casks. All distilleries, it is said, even the best, with few exceptions, adulterate their kirschwasser by the addition of cheap spirit of wine or spirit of potatoes. This liquor is exported to a considerable extent, and it is now a common thing, in our first class hotels and saloons, to hear orders for kirschwasser. The principal markets for the spirits are North America, South America and British India. France also imports large quantities of Swiss kirschwasser.

STREET BOILERS.

A PARISIAN NICKEL-IN-THE-SLOT HOT WATER SCHEME.

In Paris they now have stands on the streets, a faucet projects from the structure, and under it a place to set a pail. Near the faucet is a slot, large enough to admit a copper five centime piece, and beside the slot is a button. To use the apparatus, a pail is set in the appropriate place, a five centime piece, equivalent in size and value to the old-fashioned copper cent, is dropped into the slot, and the button is pushed; whereupon a jet of steaming hot water issues from the faucet, and runs until nine quarts have been delivered, when it stops. It may be imagined that, in a district thickly settled with poor families, the cost of hot water thus obtained is much less than it would be if a fire were kept in the cooking-stove to heat it, and the housekeepers who would otherwise have to do their washing with cold water must bless the inventor. The apparatus has, however, another use. It is the custom in Paris for hackmen to keep "bouillottes," or cans of hot water, in their carriages in cold weather to warm the feet of their patrons, and it is often troublesome and expensive for them to get the water renewed as it cools. By means of the new kiosks the bouillottes may be replenished with the smallest trouble and expense, to the great benefit of the drivers. The interior of the kiosk is partly occupied by a coil of pipe, within which is a gas burner for heating water rapidly. The coil communicates with the city water supply, so that the water drawn through is always fresh. The gas is not wasted by being kept burning all the time, but is lighted by the pressing of the button, which also opens the faucet, and this automatic closing of the faucet and turning off the gas, after the pailful of water has been delivered, are effected by simple devices.

BEEF EXTRACT.

HOW THE STRENGTH OF THE MEAT IS EXPRESSED.

We may, for convenience, divide the factory into three departments: First, pressing; second, bottling; and third, finishing. To the first of these supplies of the choicest parts of the ox are brought in the morning of every working day straight from the shambles. It is at once cut up into succulent steaks, each of which gets a slight sprinkling of table salt, is then inclosed in a new muslin bag and an outer canvas bag, and with dozens more is placed between the perforated metallic plates of a hydraulic press. When the company commenced work they were content with a press which took charge of about 100 steaks at a time, but they have had to meet a greater consumption than was anticipated, so that lately they have installed an exceedingly powerful press, which would do perfectly for making bales of cotton, and this is tested to give a pressure of 400 tons. When the pile of steaks is put on the receiver, the whole is surrounded with a jacket (iced in the summer), and the pressure applied. We need not follow the process too minutely, it is so simple. The juice as it is collected is mixed with an innocuous preservative, set aside for a month to clear, and then transferred to the bottling department. Here the liquor is filled into bottles by a siphon arrangement, so that the liquid comes into contact with as little as air as possible; and the bottles when filled are transferred to a separate building, where they are corked, capsuled, labeled, and boxed. Our traveler observed that a girl examined each bottle before it was passed on to the capsuler, and any one which showed a speck of suspended matter, or was in the least cloudy, was set aside. It was explained that this is part of the principle of the manufacture; the liquor is the pure juice of beef, and, in order that it may keep, the most rigid attention must be given to exclude foreign matter from it, and, as far as our repre-

sentative could judge, the principle was adhered to throughout. And what becomes of the pressed steaks? Well, they are like cardboard when they come out of the press, and as dry as a stick.—*Chem. and Drug.*

LEGAL HOSPITALITIES.

HOW LADIES ARE ENTERTAINED AT THE LAWYERS' CLUB.

At the Lawyers' Club, in the Equitable Building, in this city, if you are a woman, you will have the freedom of the most magnificent suite of ladies' club-parlors in the world. If you are a man, it will be your misfortune to be denied admission. A fee of one hundred dollars will, with proper credentials, make you a member of the club; but even then it will be impossible for you to enter the ladies' parlor. This sumptuous retreat belongs to the wives and daughters, the sisters and cousins, who come to the club to lunch or dine with the members. The host accompanies the ladies to the little entry, rings a bell, and resigns them to the parlor-maid. The suite in which they await the announcement of dinner consists of a parlor, bath, and toilet-cabinet. The parlor is a square room, after the style of Louis the Fifteenth, with a parquetry floor and a magnificent fireplace of Mexican onyx. The walls are done in ivory wood, the panels of which, like the garlands and ribbons in the decoration, are finished in gold. Sconces of French gilt hold electric burners, and on gloomy days a hardwood fire brightens the hearthstone. In summer the furniture is enamelled willow. Just now the polished floor is carpeted with a rich Persian rug, hangings of citron and pomegranate silk drape the windows and doorways, and the tints in the furniture coverings are also after the Persian. The library hangs on the wall. It consists of two shelves of enamelled oak, finished with gold, each containing seventy volumes. Every book is a beauty in calf—print and paper—and every one bears at the lower edge of the back, "Ladies' Parlor, Lawyers' Club." Among other authors there are the best editions of Dickens, Thackeray, Carlyle, Lytton, Reade, Young, Lamb, Sterne, Eliot, Lecky, Scott, Campbell, Pope, Addison, Ingelow, Irving, Swift, Prescott, Browning, Longfellow, Whittier, Bryant, Lowell, and Tennyson. There is neither cover nor key to the library. The books are selected for the ladies and belong to them while guests of the club. Another curious luxury is the pretty little enamelled writing-table, stocked with the finest note-paper, the nicest pens, and the most flowing ink imaginable. On the writing-tray there is a silver cruet filled with sand. When luncheon is announced the visitor is conducted to the dining parlors of the club, where she is served in the finest style. No check is presented, no tips are allowed, and the word money is not even mentioned: it is charged to the loving brother or husband. The service is the very perfection of culinary art. Every dish is a feast and each course is a little banquet.

IMPURE BLOOD.

It has probably occurred to the mind of most readers how small is the number of good complexions among men and women. While many of us are in the habit of speaking of beauty as being but skin deep, yet, as a matter of fact, the opposite is the case. In general, a handsome, healthful complexion means pure blood and healthful tissues, while on the other hand impure blood and ill-health express themselves two out of three times in an unsightly skin, expressionless eyes, and the tell-tale marks of physical disorder. Impure blood is the great evil of life. While it is not a disease, but a condition, it is yet the fountain of most of the diseases which afflict humanity. It is a perfect Proteus so many are the forms that it assumes. It expresses itself in some specific ailment, but seldom does it alike in any two cases. If a person have one or more weak spot or points, disease will appear there. It is like a chain or rope which always breaks at the weakest place. Thus children whose blood is impure and whose parents were gouty are peculiarly liable to kidney disorders. Those who inherit bad blood from scrofulous parents suffer inevitably from boils, abscesses and similar ills. The children of consumptives usually have weak digestions and poor appetites, and are subject to disorders of the assimilative system. Impure blood is transmissible from father to son to an indefinite extent. The late Dr. Dugdale in his famous study, "The Jukes," showed that in one family whose history he had carefully traced, it had gone unchanged through at least seven generations. While it is not contagious in itself, yet it is a potent factor in many contagious diseases, and in such complaints as typhus, typhoid-fever and the typhoid form of many disorders, it is the chief element of danger and death. The researches of Tyndall and Huxley tend to show that in many of the germ-diseases so-called, the germs will find no lodgment in the human body unless the blood is in a depraved state, and that the worst cases of both germ-diseases and others are always found in conjunction with impure blood. Every surgeon knows how difficult it is for patients to recover from the effects of an operation when their blood is full of contaminations. When the latter occurs, the removal of a finger, the sewing up of a slight flesh-wound or even a mere scratch will often terminate fatally. This is the prime factor in the terrible infant mortality in our great cities, in the danger surrounding child-birth, in the peril attendant upon bites from human beings, and in the spreading of such ills as ophthalmia. A chapter might be written upon the effects of impure blood upon human conduct. Every physiologist will bear testimony that it increases the vicious tendencies, that it brutalizes manhood, and that it conduces to crime. Such being the evil, what is the remedy? How shall the blood be purged of its contaminations, and the tissues freed from the humors which have accumulated in their cells? Nature, ever wise, has pointed out a sure, swift and simple system. Keep the pores open by exercise, luke-

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. COODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

warm ablutions and rubbings; keep the bowels open by fruits and vegetables rather than by medicines; increase vitality by being in the sunlight and fresh air as much as possible, and last and most memorable of all, use the blood-purifiers she has provided. These are sarsaparilla, podophyllin, yellow dock, stillingia and the iodides. They are good alone. They are best when compounded in scientific form, as in Ayer's Sarsaparilla. In this preparation they appear in their most efficient condition. Introduced into the system, they expel every impurity and restore every function to its highest power. Blotches and disfigurements disappear, the mouth becomes clean, the eyes bright, the complexion hale and beautiful. Impure blood, the king of all evils, loses its terrors for those who are acquainted with the value of Ayer's Sarsaparilla.

FURNITURE WASH.—Add two tablespoonfuls of kerosene to the pail of water with which you wash grained or other varnished furniture.

ANCIENT DENTISTS.—A physician in Rome recently brought to light some interesting specimens of ancient dentistry and artificial teeth in skulls from different Etruscan tombs, dating as far back as the sixth century before Christ.

SLEEP PROTECTOR.—To prevent the snapping and cracking of radiators when the steam is turned on, the valves being open, it is only necessary to cause the steam to enter slowly, giving the water a chance to escape and the radiator time to warm up.

PAPER BARRELS.—After three years of experimenting, paper barrels are now being made by an English firm which compete successfully with those made of wood. Waste-paper, cardboard, and old sacks are the raw materials for their manufacture.

HEAT FROM THE SUN.—The most recent observations as to the amount of heat the earth receives from the sun show that in clear, pleasant weather 63½ per cent. of heat is absorbed by the atmosphere, and only 36½ per cent. reaches the soil. This figure rises in October to 41 per cent., and sinks to 28 per cent. in January.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is

THE STRONGEST

of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

Piso's Remedy for Catarrh is the Best, Easiest to Use, and Cheapest.
CATARRH
Sold by druggists or sent by mail. 50c. E. T. Hazeltine, Warren, Pa.

1888 1889 1877 1883 1884 1880 1881 1890 1886 1885 1879 1882 1887 1878

See it grow! You won't have to look back far. 1877 was the year when *Pearline* started in to take charge of washing and cleaning. It was a new idea; people didn't know about it; when they did find out, they were afraid of it.

But look at it now. Every year has been a big advance on the year before — and 1890 a bigger advance than ever. It's the biggest year, against the biggest opposition—smooth-tongued peddlers to fight against, cheap prices and poor quality, prize packages, imitations of all sorts. But *Pearline* started ahead and has kept there—and now it's farther ahead than ever.

A poor thing can't grow like this. A dangerous thing can't. Find out for yourself why *Pearline* grows. Ask about it of some one who is using it.

Beware of peddlers and imitations. 303 JAMES PYLE, New York.

AN OPEN CHANCE.—A prize worth winning has been offered by the East Indian government. The prize is $25,000 for a practical machine for decorticating ramie. Here is a chance for some of our wide-awake American inventors to show their ability, and at the same time win a little pocket-money.

EXCELLENT PLAN.—*The Medical Bulletin* says that in some hospitals in Europe it is customary to allow visitors to converse on certain days, by means of telephone in a waiting-room, with patients in the wards; and this arrangement has been found to work admirably, as it not infrequently happens that the nervous state of the patient or the possibility of infection by the visitor renders closer communication inadvisable.

CHARCOAL BISCUITS.—Charcoal wafer biscuits, as articles of food, are not, from the nature of the active ingredient which they contain, very attractive in appearance, but they possess a flavor by no means unpleasant. Indeed, it would be difficult to say from the taste alone that they contained charcoal at all. There is, too, no objectionable feeling of grittiness experienced during mastication. They are adapted for use in cases of excessive acidity of the stomach.—*London Lancet.*

EGYPTIAN PROGRESS.—According to *El Siglo Medico*, the Egyptian government will soon institute a system of compulsory vaccination. The law says that all children must be vaccinated before they have reached the age of three months, this being done at the expense of the state in the case of the poorer classes. Violations of the law are punishable by a fine and imprisonment.

COPPER CORROSION.—Prof. Dewar has accidentally discovered that copper, heated to the temperature of boiling water, exerts a destructive effect upon india-rubber if the two come in contact. By experiments he determined that the copper oxidized the rubber. This is important information for many.

MICRO-ORGANISMS.—As long as the cause of a disease is undetected, medicine is groping in the dark, and it is only since the genesis of many disorders has been traced to micro-organisms that an ultimate attainment of the right treatment for them has become probable.

CLASS LEGISLATION.—The Legislature of Vermont has passed an act prohibiting the manufacture of "any article in imitation or semblance of natural butter or cheese," unless it is colored pink. The same restriction applies to imitations used at hotels or other public eating-houses.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Jan. 19, 1891.

The following are the market prices to-day at New York.

	New York.
Fancy Hay	65c. @
No. 1	60 @
No. 2	55 @
No. 3	50 @
Shipping	45 @
Clover mixed	45 @ 50
Clover	40 @
Prime Rye Straw	90 @ 95
No. 2 "	80 @ 85
Oat and Wheat	45 @ 50

Receipts week ending Jan. 17, as follows:

Via N. Y. Central	207 cars.
" West Shore	130 "
Other roads by Lighter, 34th Street	117 "
Total	454 cars.
Total last week	304 "
Increase	150 "

The condition of the market this week differs but little from that of last, except that prices are firmer, as above quoted, notwithstanding the arrivals from all sources are heavier, and there is no accumulation of hay except in perpetual pressed bales, which is selling slowly and at prices somewhat below that of large bales of similar grades.

We are again informed of a circular being sent out from a New York commission house quoting prime hay 75c., and, in justice to shippers, we deem it only fair to refer to it again as on a former occasion. By the closest inquiry we have failed to discover an instance where a sale has been made at that figure, or that any one in the commission trade would be justified in asking such a price, knowing the impossibility of obtaining it. These fictitious quotations are misleading, and would prove unprofitable to the shipper were they acted upon by him in purchasing hay with such prices in view. Strictly fancy hay would bring 70c. should any of that kind arrive just now.

In answer to inquiries made relative to the continuance of the present market for a week or two hence, we would say that it is unwise to predict anything for the future, as it depends largely on the receipts as well as the demand. At the same time, we consider the market fairly encouraging.

Rye straw scarce, and in good demand at 90c., and a few sales have been made at 95c.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$14.50 to $15.00
Hay, choice to fancy, perpetual pressed bales	13.00 to 14.00
Hay, fair to good	12.00 to 13.00
Hay, poor to ordinary	10.00 to 12.00
Hay, Clover and Clover mixed	10.00 to 11.00
Hay, swale	9.00 to 9.50
Straw, Rye, good to prime	17.50 to 18.00
Straw, Oat	9.00 to 10.00

BOSTON, Jan. 17th, 1891.

Receipts for the week are 441 cars of hay and 33 cars of straw; corresponding week last year, 187 cars of hay and 15 cars of straw. The receipts of hay continue heavy and in excess of demand. The market is dull and weak, and decidedly in buyers' favor; quotations are nominal and represent asking prices; they are, however, frequently shaded in order to effect sales. Rye straw is quiet, with moderate demand.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

All New Subscriptions sent now will be good until January, 1892.

ANOTHER DRESSED BEEF TRIUMPH.

The dressed beef men have had another triumph over the obstructionists. This time the location is Virginia. On January 19th the United States Supreme Court handed down an opinion affirming the judgment of the Circuit of the United States for the Eastern District of Virginia, directing that a writ of habeas corpus be granted to William Rebman, convicted in Norfolk of violation of the State Meat-Inspection Law. This is one of what are known as the dressed-beef cases, arising out of State legislation to restrict the sale of meats by firms located outside the State in which the meats are offered for sale. The statutes of Virginia make it an offence to offer for sale fresh meats slaughtered more than 100 miles from the place of sale unless first inspected, provision for which is made on the petition of not less than twenty persons, the compensation to the inspector to be one cent a pound. It was contended that this law was an interference with inter-State commerce, and therefore unconstitutional and void. The court, in an opinion by Justice Harlan, sustains this contention and affirms the judgment of the lower court ordering Rebman's release.

PURE FOOD PROSPECTS.

The Pure Food Bill appears likely to fall through in the present Congress—as it had done in so many previous sessions of that progressive body of legislators. The fact is, as we learn from the well-informed Washington correspondent of the *Commercial Bulletin* there is a manifest conflict betweeen that most desirable measure and the Conger Lard bill. Senator Paddock, of Nebraska, has several times given notice that he would at the earliest moment call up in the Senate the Pure Food Bill, which covers the whole ground of food adulteration, while Senator Allison has announced that he will urge the consideration of the Conger Lard bill. The Conger bill deals with lard and its substitutes, and by imposing a tax upon the substitutes, placing the manufacture under the supervision of the Internal Revenue Bureau of the Treasury Department. This bill has already passed the House, and if either measure is to be enacted, it will be much easier to get this one through the Senate and to the President than a bill which has not yet been considered in either House. The rapid approach of the end of the session makes it almost impossible that so sweeping a measure as the Pure Food bill can pass both Houses and become a law. Senator Paddock is much interested in the Pure Food bill, and has given much study to its form. He believes that he has overcome the Constitutional objections to legislation which deals with the food and drink of the people by making the bill apply only to articles which are the subject of Inter-State commerce. The theory is that the manufacture of adulterated articles for consumption within a State will soon cease when they cannot be sent outside the State and that the public will refuse to buy articles which are not good enough to be subjects of Inter-State commerce. A number of prominent Democrates are not satisfied that the bill escapes Constitutional objections even in its present form, and it is likely to be discussed at length before it can pass either House. Mr. Hatch, of Missouri, who was Chairman of the House Committee on Agriculture in the last Congress, is a Democratic member who is disposed to go as far as any one in Federal legislation for the benefit of the farmer, but he says that he would speak and vote against a Pure Food bill which sought its object by such means as Senator Paddock's bill. The subject was pretty thoroughly canvassed by the Democratic members of his Committee in the last Congress, and they could not see their way clear under the Constitution to report a bill. If Senator Paddock succeeds in getting up the Pure Food bill, he will doubtless move that it be substituted for the Conger bill, which is before the Senate. This will help him in a parliamentary sense to pass his bill. The substitute would go to the House for concurrence, or non-concurrence and in the natural order of things would go to a Conference Committee. A substitute of so different a nature, however, from the original bill would hardly be allowed to go into conference without pretty full consideration on the floor. Such consideration would take time, even if it did not result in an adverse majority. The members who placed the Conger Lard bill before everything else in importance would be disposed to reject the Senate substitute with the hope of compelling the Senate to accept the Lard bill. If it became necessary in the closing hours of the session, dilatory tactics would very likely be adopted to prevent the hasty enactment of such a sweeping measure as the Pure Food bill.

WOMEN'S WAGES.

One of the most laudable minor journalistic enterprises of the day, that has come to our notice is *The Nightingale*, a small eight page weekly published in this city, as the advocate and organ of female nurses. In a recent issue is a brief discussion of the difficulty unprotected women encounter in securing for themselves "the price of bread." The universal discrimination against the sex, which refuses to women the wages willingly given to men for similar services, is one of the principal causes of the difficulty referred to, though there are other obstacles to be overcome which must be in some way offset before we can hope to see that palpable injustice rectified. Elsewhere in the same paper we find an argument on the question of the relative wages of men and women. The editor says in reply to the argument that if the wages of women increase the wages of men must diminish, there being only so much money in the country for the payment of the labor offered:

"Certainly the wages of men might diminish. Why not? Why should'nt the woman receive her part of the work of the country and her part of the pay of the country directly, rather than to have it filter down to her through the hands of particular men? Does the earth belong to men only or does it belong to women also? If women have the right to be, they have a right to their part of the industries of the country regardless of consequences. You say but it is better that women should be supported by men. We deny it. It is better that every woman should support her individual self by her own labor. We do not here except married women, even. There is a feeling in the air which points to the financial independence of married women. It is a curious fact that the women most interested in the questions of women's rights are married women; and women happily married, too. It is a curious fact that unmarried women have with few exceptions very little influence in their ranks, it being felt that the unmarried woman is an anomaly, and scarcely knows what is best for the class. It is a curious fact that the unhappily married woman—the divorced woman, the woman separated from her husband—is not brought forward at all in their councils, any scandal of that sort being sufficient to degrade the individual from leadership. No, the national suffrage organization asks for certain rights for the normally situated woman, for the married woman, the child-

bearing woman, in her home. Study this subject a little more closely and you will be amazed at the lengths to which it will carry you. But you may say, even acknowledging that woman should have equal pay for equal work, it is seldom that the woman really does good work or valuable work, she is not really worth so much as the man. We are sorry to say that this is true, and, just here is a chance for immediate reform. It is a reform, however, which must commence in the cradle. In the first place our girls have the right to sound bodies, bodies as strong as their brothers' bodies are, to say the least. You do not tolerate any restrictions which physically cripple your boy. Do not cripple your girl at a time when she can have no voice in her development. In the second place, you can see to it that your girl is furnished with a money-making occupation."

IMPROVEMENT IN CALIFORNIA WINES.

Within the last eight or ten years there has been a revolution in the character of California wines. Any one familiar with the output of the California vineyards of ten years ago would not recognize the wine now put on the market. Instead of a coarse, rough, fruity wine, we have now as smooth, pleasant a beverage as one would wish to drink. Most people ascribe this to the improvement that has taken place in the character of the grapes, but as a matter of fact this has very little to do with it. The grapes of ten years ago were nearly as good as they are now, but few people knew how to treat them. When wine-making first became an important industry, the owners of vineyards went to Eupore for experts to superintend the manufacture of their wine. The result was disastrous failure. Each manager tried to treat wine as he had been accustomed to at home, to press it in the same manner, and to keep it in the same kind of cellars, without making any allowance whatever for difference of climate and difference of grape. A crude, rough wine was the result. The vineyard owners were greatly discouraged, and the superintendents went back to their native countries convinced that there was no future for the California grape. A few remained and undertook to adapt their European experience to changed conditions. Experiments were made. Where one mode of treatment failed, another was tried, and finally the secret of handling the different kinds of California wine was discovered. To-day, not only is the home consumption large, but millions of gallons of claret are annually sent to France to be reshipped from that country with a French label, and pronounced excellent. The grapes are about the same as they were ten years ago, but improved methods of treating the juice have revolutionized the California wine industry.

A SPOOK CENSUS.

A QUEER AND CURIOUS COLLECTION OF QUAINT AND CASUAL COINCIDENCES.

The Society of Psychical Research is still busily engaged in taking a census of hallucinations, a work started in Paris in 1889 at the International Congress of Experimental Psychology. In England the census is under the care of Professor Henry Sidgwick, of Cambridge University, president of the Psychical Society; in France Leon Marillier is collecting experiences, and in the United States, Professor William James, of Harvard University, has assumed charge of the work. The experiences which it is sought to enumerate are scientifically described as "casual hallucinations of sane persons, including under this term phantasmal appearances, which some deny to be hallucinations, because they believe them to be ghosts." The object of this inquiry is to ascertain the proportion of persons who have had such experiences, and to obtain details of these experiences so that some insight may be gained into their cause and meaning. The general question is framed in this way: "Have you ever, when believing yourself to be completely awake, had a vivid impression of seeing or being touched by a living being or inanimate object, or of hearing a voice; which impression, so far as you could discover, was not due to any external physical cause?" Of course, for a census, the answer "no" is as important as the answer "yes," but one result of the census thus far has been to show that the affirmative answers are rare and infrequent. Professor Sidgwick has recently made public a partial report of his work on this census in England. In that country 6,481 answers have been received to the question given above; of these, 3,617 have been from women; and 727 have been "yes" answers, a percentage of 11 of the total number received. Five hundred and nine women answer "yes," and 218 men furnish the rest of the "yes" answers; of the "no" answers, 2,646 are by men, and 3,108 by women. Of the "yes" experiences in 474 cases the sense of sight was affected; in 219 voices were heard without any accompanying visual impression; and in 56 cases the sense of touch only was affected. In about 48 cases of the whole number more than one sense was affected at the same time, but it is pointed out that it is difficult in the case of sounds, especially of non-vocal sounds, such as rustling, footsteps, etc., to ascertain whether they were hallucinatory or not. There are some cases, bordering on ghost-land, which there is some reason to regard as purely subjective. Thus there are six cases of the figure and one of the voice of dead persons "phantasmally seen or heard when the percipient was unaware of the death." There are nine cases where apparently the same figure is independently seen by more than one person on different occasions. Of considerable importance, as indicating a corroboration of experience, are the sixty-six collective cases—cases in which more than one person shares the experience. More than half of the visual collective cases occurred out of doors, while of the visual cases occurring to a single percipient only about one-seventh occurred out of doors. On this point Professor Sidgwick observes.

"Now, though some supposed apparitions seen out of doors are quite as obviously true hallucinations as some of them seen indoors, still, speaking generally, there seem to be several reasons why real human beings are more likely to be mistaken for apparitions out of doors than indoors. Further, if the figure be unrecognized this can seldom be regarded as evidence of its hallucinatory character out of doors, while it would often afford evidence indoors, since it is not usual for strangers to walk into rooms without any one in the house knowing anything about it. And, again, the mode of appearance and disappearance of the figure is much more often clearly impossible for a real person indoors than it is out of doors. The figure may, for instance, go through a locked door, or through the wall, or into a room into which it is at once followed and where it is not found. Out of doors it is often difficult to prove that the vanished figure has not simply turned into a house or been hidden by some obstacle. After making all allowances, however, there remains a certain number of collective cases in which the objects seen can hardly have been real people or things."

Professor Sidgwick then proceeds to give some remarks on the nature and origin of hallucinations, and points out that the common origin of collective hallucinations may be telepathic (some other mind affecting the common percipients similarly and simultaneously), or it may be due to what he calls "physical suggestion," "by which I mean some real external cause—say a sound like a footstep—starting by suggestion a similar hallucination." "Hallucinations," he adds, "are so rare in the experience of most of us that it may fairly be argued that when we see them we are not quite in a normal state, and I think there is reason to believe that self-suggestion sometimes operates during a hallucination, for it is sometimes difficult otherwise to account for the occasional agreement of two senses. For instance, a lady in the dark feels her husband's presence, then putting out her hand, feels his coat-sleeve, and then hears him speak. The husband, meanwhile, is absent and vividly imagining himself to be bringing her bad news." Two more explanations of collective hallucinations are set forth: the one that A sees a hallucination first and then conveys it by word or gesture to B; the other that the hallucination of one percipient is caused by mental suggestion or thought-transference from the other. An interesting experiment illustrating the latter hypothesis is given, to conclude Professor Sidgwick's account of the work on the census. It is an experiment in thought-transference with two hypnotized persons, conducted by Mrs. Sidgwick and a Mr. Smith. Here is the experiment as described in Professor Sidgwick's words:

"Two persons were hypnotized in different rooms. We will call them Mr. P. and Miss B. You are no doubt aware that good hypnotic subjects can be made to have post-hypnotic hallucinations—e. g., if told while hypnotized that they will see some specific object when they awake, they do see it, though there is nothing of the sort there. Mr. Smith told Mr. P. that Mrs. Sidgwick would show him a picture, and then went out of the room and told Miss B. that she would see a picture which Mr. P. would show her when her eyes were open. While he was away Mrs. Sidgwick told Mr. P. that she was going to show him a picture of a goat-chaise with two goats. Then Mr. Smith came back, awoke Mr. P., and left again immediately. After which Mrs. Sidgwick gave Mr. P. a blank card as a picture and he almost immediately saw on it the picture of a goat-chaise and two goats and was much pleased with it. Mrs. Sidgwick asked him to take it upstairs and show it to Miss B., but to be careful not to tell her what it was. This he did. Miss B. at first only saw something black on the card, then by degrees she saw, first some wheels, then 'a nice little wee carriage,' and presently some animals in front which she identified as two goats. This seems to be a case of collective hallucination, and one which was conveyed to Miss B. by thought-transference from Mr. P."

The census inquiry is also proceeding in America, France, Germany, and Italy, but no detailed reports have yet been received from these countries. A report on the census is to be made to the International Congress of Experimental Psychology in 1892, and it is hoped that 50,000 answers will be received by that time. Professor William James, of Harvard University, will willingly supply the necessary forms to any one in this country who is interested in this subject.

MENTAL HABIT.

AN INTERESTING WRITING TEST AND ITS RESULTS.

In a paper entitled "A Study in Mental Statistics," Prof. Jastrow describes the results of a mental test in which fifty students of a class in psychology, at the University of Wisconsin (twenty-five men and twenty-five women), took part. The task consisted in writing 100 words as rapidly as possible. The material thus collected was utilized to shed light upon (1) the similarity of our ideas and habits of thought, (2) the links that bind our ideas together, and (3) the time required for these processes. 1. The general tendency to regard one's mental habits and products as singular and original, and consequently to look upon every evidence of similarity of thought as a strange coincidence, receives a set-back from the result of the present and similar studies, for it is found that these fifty persons, independently writing one hundred words from the many thousand with which they are acquainted, all in all, select from the same 2,024; *i. e.*, of the 5,000 words written, only 2,024 are different. Again, 1,266 words occur but once in the aggregate lists, and omitting these we find that about 3,000 of the words are formed by the repetition of only 758 words. Passing to an analysis of this "mental community," it becomes clear that it is greatest at the beginning of the list, and becomes less toward the end; *i. e.*, the habit is to write first the most common, and when these are exhausted, the more unusual words. A very interesting point is the comparison of men and women in their tendency to repeat one another's thoughts. The evidence is unmistakable that the lists of words drawn up by the women are much more like one another than are those written by the men. The women use only 1,123 different words, the men 1,376. The women write but 520 words that occur but once in the lists, the men write 746 such words. 2. A study of the processes involved in these lists bases itself upon a careful analysis of the ideas therein represented. The relative sizes of such classes, in a measure, indicate the prominence of different

classes of objects in the minds of the writers. It may be interesting to mention that the five best represented classes (of the twenty-five adopted in the paper) are "Names of Animals," "Articles of Dress," "Proper Names," "Actions," "Implements and Utensils." The sexes present characteristic preferences for the various classes. The women contribute most largely to "Articles of Dress," writing 224 such words, while the men write but 129. They show an equal favoritism for "Articles of Food," writing 179 such words to but 53 for the men. The men, on the other hand show fondness for "Implements and Utensils," "Names of Animals," "Professions," "Abstract Terms," etc. Of the various links by which the one word suggests its successor, it may suffice to indicate as prominent types, (*a*) association by sound, in which words are rhymed, or begin with the same letter; (*b*) by belonging to the same class, as when a series of animals or articles of dress is formed; and (*c*) by more general but not briefly describable relations. One may combine the two inquiries (1) and (2) to ask how often the same word is associated with the same word in different lists. If we take the twenty words most frequently occurring, we find over 500 mentions; and if we examine in each case the word preceding the given word, we find it to be the same in 111 cases, and the succeeding word the same in 145 cases—certainly a remarkable result. Here, again, the women are found to repeat one another more than the men. 3. Regarding the time occupied in the process, the result reached is that (roughly speaking) it takes, on the average, 308 seconds to write such a list of 100 words; that 210 seconds are consumed in the mere act of writing, 114 seconds in thinking of what to write, and 16 seconds in which both may be done. These results are offered, in addition to whatever value they may posses, as an illustration of how, by simple experimental methods, we may become more intimate with the processes that we constantly but unconsciously perform.

ICE IN THE TROPICS.

UNPOPULARITY OF ICE IN TROPICAL REGIONS.

The town of Colon on the Ithmus of Panama, has three forlorn and unappreciated refrigerators. Cigars are stored in one of them, and a shopkeeper includes the other two among his unsalable lumber. The town has no use for ice, and refrigerators are a drug in the market. According to recent consular reports received at Washington, the only countries where ice is not popular are some tropical regions where one would suppose the cooling commodity would be welcomed as one of Heaven's best gifts. The little island of Reunion has ice and snow on the tops of two of its mountains, but the people regard them as damp and uncomfortable, and keep away. Most Brazilians believe that it is unhealthy to use ice in their climate. Three tons of ice a day suffices for the city of Santiago de Cuba with 48,000 inhabitants. Two-thirds of the population are Negroes and Consul Reimer writes that even if ice were cheaper, he is convinced they would not use it. In the Philippine Islands ice-water is regarded as injurious to health, and drinking-water is cooled by putting it into bottles which are laid on the ice. In Jaffa, the seaport of Jerusalem, a company was formed three years ago to make artificial ice, but the enterprise was soon abandoned, as customers were not found for the product. A liking for ice, like the taste for olives, must be cultivated. But there are other very good reasons why ice is not destined soon to come into general use in tropical towns. Most of their inhabitants are very poor, and ice is a luxury beyond their means. Not a few customers of ice in this city last summer reduced their daily supply when the price was advanced to a cent a pound. Perhaps some of them would have worried along without any ice at all if the ice merchant had demanded five cents a pound, as he does in Tangier, Managna, Iquique, Bahia, Valparaiso, and many other places, or even three and a half cents, the ruling rate in Rio de Janeiro. When ice sells at four-fifths the price of sugar, poor people have no opportunity to become familiar with its advantages. Most natives in the tropics, however, fail to understand that ice is useful for any purpose. The good housewife of Brazil, for instance, would think it very poor domestic economy to buy an ounce of meat or fruit not required for the day's needs. One of our consuls in Colombia says the people of that country have a prejudice against keeping fresh meat uncooked. They do not wish to preserve food. "The people of Dutch Guiana," writes Consul Browne, "buy only enough food to last from day to day." The habits and ideas of these people must be revolutionized before they will regard refrigerators with favor or have any use for ice. In the chief town of Dutch Guiana only 500 people in a population 27,000 use ice at all. Our consul at San Jose, the capital of Costa Rica, writes that the standard of comfort among the 25,000 people of that town is not sufficiently high to bring refrigerators into use. In Zanzibar and South Africa the high price of manufactured ice precludes any general use of it. Maine ice in considerable quantities finds its way to far southern latitudes. By the time congealed portions of the Kennebec River reach the Isthmus of Panama they are quoted at five cents a pound. The same ice at Nassau is worth four cents a pound, while at Bermuda it sells at the comparatively cheap rate of three-fourths of a cent a pound. The only cargo of ice ever landed in Cadiz went from Boston in 1856. The customs officers insisted that it must be landed on the docks in a burning sun and weighed like other freight. The argument that ensued lasted for several weeks, and most of the cargo turned into water before the vessel was unloaded. Two shipments of ice from New England have recently been sent to the tropical coast of West Africa, but neither proved profitable. No adequate means has yet been provided there for the preservation of ice, and the larger part of these cargoes melted before they could be sold. Recent attempts to develop a trade in ice between this country and Egypt have been unsuccessful because the artificial product made in Cairo, Alexandria, and Suez undersells the imported article; and one of the most interesting phases of the commerce in ice is the rapid growth of the manufacture of artificial ice in many parts of the tropical and semi-tropical world, even in Asia Minor, Fiji and the Philippine Islands. It is altogether likely that its production in tropical regions will gradually overcome the widely prevailing prejudice, and that ice will be used for other purposes than merely to cool beverages in barrooms for foreigners.—*Sun.*

HYPNOTISM.

A FRENCH GIRL'S REMARKABLE MESMERIC POWER.

A party of newspaper men and physicians in this city witnessed, on January 21st, a private exhibition of hypnotic power given by Mlle. Charcot, niece of the famous Paris alienist of that name. Mlle. Charcot is tall and slender, with dark hair and deep-set eyes. She had two subjects whom she had put under hypnotic influence on a previous occasion. Some physicians said the subjects gave the impression of being inclined to epilepsy. Manager E. G. Johnson spoke about the influence of personal magnetism, and then the performance began. One of the young men was put to sleep. He sat in his chair, his right hand crossed over his left. A needle was passed through each ear and the thread left dangling; his tongue was drawn out and a thread put through it. Blood did not flow, and Citizen Train, who was present, asked for blood. At the will of Mlle. Charcot it appeared upon the tongue. The young man was then awakened. The other subject was then hypnotized and made rigid. His head was placed on one chair, his feet on another, he formed a bridge on which two men weighing 365 pounds sat. A lighted cigar was then placed on the subject's forearm and the flesh sizzled. The man remained unconscious. A physician desired that the subject should be made to feel pain, and the young man immediately doubled up with the colic and jumped around the stage. Then Citizen Train, who had acted as psychic questioner, requested Mlle. Charcot to mesmerize some one in the audience. She went to the back of the hall, and a young man in the audience rose and went towards her. He acted as if dazed, as the others had. Mlle. Charcot was evidently much distressed after this. Her face was flushed and her eyes unnaturally bright. She said that the last test had exhausted her more than all the others. A person once acted upon is easier to put under the influence of the will than a fresh subject, and hypnotizers prefer to have former subjects in their public exhibitions.

POWER AND WASTE.—Maxim, the inventor of the "Maxim gun," claims to have constructed an engine of 500 horse-power, weighing, 1,100 pounds, or 2.2 pounds per horse-power. Some of the largest and most efficient engines have about 112 pounds dead weight per horse-power, including water.

GOLD WEAR.—By careful experiments made at the United States Mint it has been shown that $5 are lost by abrasion every time $1,000,000 in gold coin are handled. The experiments were conducted with bags containing $5,000 each, and it was shown that the mere lifting of the 200 bags making up $1,000,000 to a truck to be removed to another vault resulted in the loss stated, and that their transfer from the truck again made a second similar loss.

SOUND BELOW ZERO.—The velocity of sound in air at low temperatures has recently been measured by determining the interval between the flash of a gun 12.8 meters distant and the report. For temperatures 10.9 deg., 25.7 deg., 37.8 deg. and 45.6 deg. below zero (Centigrade) the velocities were 326.1, 317.1, 309.7 and 305.6 meters per second. From this it appears the velocity of sound diminishes 0.603 meter per second for each degree (Centigrade) or rise of temperature.

WATCHES AS COMPASSES.—"All watches are said to be compasses, and the matter is explained in this way," says a writer: "Point the hour hand to the sun and the south is exactly half way between the hour and the figure XII on the watch. For instance, suppose it is four o'clock. Point the hand indicating IV to the sun and II on the watch is exactly south. Suppose it is 8 o'clock, point the hand indicating VIII to the sun, and the figure X on the watch is due south. This is a good thing for woodmen and hunters to remember."

NOT ENTIRELY A SLAVE.—Visitor (philanthropically inclined)—Auntie, don't you think you would enjoy better health and live longer if you could quit smoking? Auntie (aged 98)—I don't smoke all the time, mum. Sometimes I go half a day 'thout touching' my pipe. Been doin' that away, off an' on, fur about—(to a great grandson)--you, George Wash'nton! give the lady a cheer ur I'll thess jerk the top o' yer head off'n ye!—fur about seventy-five year, mum. Land sakes, I aint no slave to the habit.

THEOSOPHIST.—The term "Karma" is employed by writers on Oriental supernaturalism, and has reference to the Indian doctrine of transmigration. One writer says that Karma represents the physical life of a man, his mental tendencies towards good or evil, his feelings and acts during life being, as it were, grouped in a form that attends his spirit or soul during the time that elapses between his death and birth into a new state. The character of this Karma attributes to its owner a high or low moral state, and has a bearing upon the sort of existence that will be his in the next form.

DON'T SCOLD.—How many lectures there are against scolding and fretting, and how true they all are, and yet how often do we forget to practice and profit by the truth. Suppose we begin in a small way at first, and resolve that we will not use a scolding or angry tone, and if we cannot help using cross words, let us speak them in a pleasent tone. The tone of scolding tells upon the throat just where a women who is not over-strong is apt to feel the ache of extreme fatigue. The children, too, who are great imitators, will be sure to catch the scolding tone. and will talk to their dolls, to one another, and by and by to their own children, very much as their mothers are now talking to them.

HOW WE CATCH COLD.

BY R. W. MILLER, M. D., LOS ANGELES.

In regard to the *modus operandi* or mechanism of those cases (of coryza) not referable to local irritants or of specific origin, several views have been offered in explanation. Dr. Carl Seiler, "Med. and Surg. Rep.," vol. XLIV, p. 565, quotes an anonymous writer in London *Lancet* as follows: "Practically the human organism must be maintained at a temperature equal to 96.5 deg. Fahr. in all climates. The source of this heat is within us, and we wear clothes to minimize the expenditure of this heat by radiation." Now observation of the origin of this heat is of practical importance in its bearing upon the etiology of coryza. It is produced chiefly in two ways: 1. By the oxidation of food; 2. By the conversion of muscular action into heat, according to the law of correlation of forces. The standard of heat given above is perhaps rather low. In order to maintain the proper standard the Esquimaux eats chiefly oils and fats, while those living in the tropics subsist chiefly upon vegetables and fruits. As the spring-time approaches, those of us living in the temperate and semi-tropic climate use less fatty and animal food, or, failing to observe the necessity of so doing, suffer from excess of animal heat, dyspepsia and congestion of the abdominal viscera, with an accumulation of effete products, which condition is a synonym for "spring fever." Is it not reasonable to infer that at other seasons of the year and under other circumstances these congestions and pent-up products may, in a measure, find expression in the form of a coryza? Rosenthal's view is that the immediate effect of cold, when applied to the surface of the body, is to contract the vessels, thus driving the blood to the internal organs, where it irritates and excites inflammation. There may be some truth in this, but it seems to us not to cover the entire ground, as from the external application of cold we may have eczema, a disease of the skin, or other inflammations of the deeper organs or viscera. The different chemical qualities of effete products within the body has been alluded to by some writers as having to do with determining the location of the inflammatory process. But what are those chemical qualities? What are those qualities having a harmful selective action upon the lining of the nasal chambers in one case and upon some other organ or visceras in another? Diathesis or dyscrasia may serve to answer this question in part, because of their attacking and breaking down the power of certain organs and tissues to resist disease, as the strumous diathesis affects chiefly the lymphatic system, while the rheumatic attacks the fibrous tissues, etc. Seitz's theory is that the rapid removal of heat, either from the external or internal surface of the body, causes some functional disturbance, which gives rise to some morbid process in a remote part. This is euphonious, yet seems rather much like dealing with "glittering generalities." The excess of ozone in the atmosphere is believed to act as a cause of coryza in very many cases. Bosworth believes the nervous system to play a very important role in the etiology of this disease. He almost goes so far as to express the belief that coryza is in many cases essentially a nervous disease. Any of us may well ask, how much of an impression upon the "internal organs" would be made by "local application of cold" and the "rapid extraction of heat," were there no nerves to convey these impressions? Certainly we must keep the nervous system prominently in view in all our efforts to solve this problem. I am inclined to the opinion that even a "reflex" nervous influence may be operative in causing acute coryza. It seems an established fact that intense nervous excitement will in some persons precipitate an attack. The causes are general, local, predisposing, and exciting. The first and last have already received considerable attention in this paper. To general causes may be added improper and insufficient clothing, an in-door life, insufficient physical exercise, lack of proper attention to bathing, and bad ventilation. Of local causes we may mention the inhalation of dust, irritating vapors from chemicals, etc., chronic thickening of the turbinated tissues, exostoses, enchondroses and deviations of the septum, polypi, congenital deformities, and all other obstructive lesions of the nares of whatever kind. Most of this latter list may also be considered predisposing causes. Of the general or constitutional predisposing causes, some of the most frequent are debility, dyspepsia (by compromising the generation of animal heat), struma, so called, the gouty and rheumatic diathesis, and tuberculosis. To these may be added atony, or a state of unstable equilibrium of the vaso-motor system of nerves, and this latter may be either general or local. In military life, the soldier, while acting as a sentry, becomes worn and weary, while his comrades renew their energies by sleep. So the nasal membrane, being always in the picket line, always on duty, and exposed to almost constant irritation, becomes weakened in functions, and this weakness in time becomes a predisposing cause of renewed attacks of coryza. Prophylaxis is highly important, and with many patients must enter largely into the treatment in order to prevent relapses. A careful observation of the manifold causes will serve to indicate the proper measures requisite to this end. Treatment is local and constitutional. Every case of coryza ought to be cured as quickly as possible. We must not here omit its importance in nurselings, as in them it sometimes leads to complications rapidly ending in death. In the way of local treatment, such remedies as constrict the vessels, as a two to four per cent. solution of cocaine, frequently applied, mild solutions of atropine used as sprays, powdered belladonna, morphia, bismuth and talc mixed, and used by insufflation three times in the twenty-four hours, are useful in the first stage. Regarding cocaine, it must be remembered that with some patients the effect is very transitory, while in others it seems almost entirely wanting; that reaction soon follows, unless the effect be steadily maintained, and, last, the highly important fact that great care is necessary in order that we may not become accessories to its too general and habitual employment by our patients and others. There is reason to fear that there may be truth in the accusation coming from some of these *habitues*, that "My physician taught me to use it." In those who are "always catching cold," and tell us they have colds the year round, careful inspection of the nares will usually discover some obstructive lesion, although, if it be swelling of the turbinated tissues, repeated examinations at different sittings may be necessary to detect it. The treatment of the permanent obstructive lesions is essentially surgical, operative procedure being best adapted to a large portion of them. Contact of the walls of the nares is almost always attended with decided hyperæsthesia of the parts involved, and usually maintains constant irritation until removed. The swelling of the turbinated tissues, when excessive, can usually be promptly controlled, at least for the time being, by cocainizing the parts and carefully applying the flat surface of a small electrode attached to the galvanocautery and brought to a medium heat. Of the constitutional remedies appropriate to these cases, almost all intelligent and well-informed practitioners of the present day are fully capable of making their own selections in the individual cases which they are called upon to treat. Brief allusion to a very few only will here be made. Opium, or some of its derivatives, in small, frequent doses, if the patient continue out-of-doors, remain among those having the strongest claim for our confidence. Antifebrin or pilocarpine, if diaphoresis be the chief aim, act well, while as analgesics, antikamnia, phenacetine, and antipyrine are often serviceable. Quinia is useful, both as an abortive and a prophylactic against relapses, but the fact that it congests the tympanum, and may contribute to producing deafness, temporary or permanent, should be borne in mind, and the laity should be warned against its too frequent and heroic employment.

FULMINATES.

WHAT THE FAMILIAR EXPLOSIVES ARE MADE OF.

Every one has noticed the grayish substance in the interior of a percussion cap, which only needs the blow of the hammer to cause it to explode with great violence. A similar substance is found in the torpedoes so popular among children on the Fourth of July. This body is known to chemists as fulminate of mercury, and is not only interesting from its chemical composition and relations, but is of great commercial importance, although a comparatively small quantity is needed to supply the demand for it. This exceedingly unstable and explosive substance is the mercuric salt of an acid known as fulminic acid (from *fulmen*, the thunderbolt). The free acid has never been produced, but the fulminate of mercury is easily and cheaply prepared, and has the empirical formula Hg C2 N2 O2. Like nearly all the compounds of nitrogen, the molecule is extremely unstable, and a slight blow, a temperature of 363 deg. F., or even contact with strong sulphuric or nitric acid, causes the molecule to break up like a house of cards, and to be transformed into nitrogen and carbonic oxide gases and vapor of mercury. Like nitro-glycerine and other high explosives, the reaction, or explosion, takes place in the molecule itself, and is not, as in the case of gunpowder, simply a very rapid combustion, and this property explains the intense force of the explosion. It is estimated that at the moment of explosion a pressure of 720,000 pounds to the square inch is generated. Mercuric fulminate is prepared by dissolving mercury in an excess of nitric acid, and adding alcohol; a very brisk reaction and effervescence soon begins, and the fulminate separates as a crystalline precipitate. The actual chemical changes which take place in this reaction are very complicated, and are not thoroughly understood, but the final result is as above stated. As soon as red fumes begin to appear, water is poured in to stop the reaction, and the precipitate collected on a filter, washed, and kept moist until needed for use. This experiment is a very dangerous one for inexperienced persons, both from the risk of explosion and the poisonous gases evolved, and should not be attempted by beginners in chemistry. Large quantities of this fulminate are manufactured at Prescott, in Ontario. Two or three times a year an American firm sends a party of workmen to this place with the necessary quantity of nitric acid, mercury, alcohol, etc., and for a few days the town is redolent with the fumes of alcohol, aldehyde, ethers, etc., until the desired amount of the explosive is prepared and safely packed in kegs of water for transportation to market. The profits are said to be very large, but we hardly think any one will grudge the manufacturers of this treacherous compound all that they can make out of it, or would desire to undertake the work themselves at any price. With proper care the risk of an accident is small, but when an explosion does occur the destruction is complete, and there is little or no chance for escape. The pure fulminate is so powerful that, in the manufacture of percussion caps, it is generally mixed with other substances to moderate the force of the explosives. Chlorate and nitrate of potash, sulphide of antimony, and powdered glass have been used for this purpose; but it is probable that they have no chemical effect upon the explosive decomposition, but simply act mechanically by diluting the pure fulminate. One pound of mercury will produce enough fulminate to fill over 25,000 percussion caps. One of the most interesting applications of fulminate of mercury is its property of detonating dynamite and other nitro-glycerine explosives. Dynamite cannot be easily exploded by contact with flame, and it may even take fire and burn up quietly, but if a tube containing fulminate of mercury be placed in the midst of a charge of dynamite and exploded in the usual way, it induces a similar explosion or detonation of the whole mass of dynamite with its well-known powerful effects. It seems as if the violent detonation or rapid molecular vibration of the

fulminate induced a similar detonatory vibration in the molecules of the dynamite, just as the strings of a piano are set into musical vibration when a note of the same pitch is sounded in their vicinity. Fulminate of silver is analogous in composition to that of mercury and is made in a similar way, but is much more violently explosive. It detonates when merely pressed with a hard body, and at a temperature a little above that of boiling water. Even when wet it is not safe to keep it in a glass bottle, and we know of a case where a quantity exploded while being washed on a filter, the probable cause being the friction of the stream of water which was being poured over it. The glass funnel was shattered into atoms, but the chemist who was washing it escaped, almost miraculously, without serious injury. A compound silver-ammonium fulminate is also known, which is even more violently explosive than the silver salt. Fulminates of zinc, copper, sodium, potassium, etc., are known and are all explosive, but have only a theoretical interest. Nitrogenous compounds of silver and gold are also known to chemists by the names of fulminating silver or gold, but they have no connection with the true fulminates, and are of little consequence. The effect of the element nitrogen upon its compounds is one of peculiar interest. The element itself is a neutral, inactive body, with no particlar characteristics and of little practical consequence, but when in combination with other elements it usually confers an element of instability upon the whole compound, like an arch with a defective keystone. If this falls, the whole arch is destroyed, and so in the molecules of the fulminates and similar bodies; the integrity of the molecule seems to depend upon the feeble chemical affinity of the nitrogen, and when this is overcome by percussion, heat or a stronger chemical affinity, the whole molecule collapses, as it were, with explosive violence, and is instantly changed into simpler and more stable chemical substances.—*Popular Science News.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, geese.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

RICE AND PEA SOUP.—Boil until tender, in different pots, a cup of dried green peas, and three heaping tablespoonfuls of rice; when done put them together and add one quart of soup stock or mutton broth; boil up, season with salt and pepper and serve with bits of toast.

CURRIED MUTTON.—Mince very fine any left-over cold mutton; add to it half an onion, minced; salt and pepper and a little curry powder; moisten well with milk; heat thoroughly and serve.

GREEN PEA FRITTERS.—Make a good batter for fritters, using one pint of milk, three well beaten eggs, yolks and whites beaten separately, one teaspoonful of baking powder and a little salt. To this put a half cup of parsley and sweet herbs, chopped fine and seasoned with pepper and salt, and half a cup of green peas. Fry in boiling fat, drain and serve very hot.

CHICKEN MAYONNAISE.—Boil a fine chicken in bouillon broth, if you have it, if not, in water. When it is done take it out and remove all the flesh from the bones; take out carefully all the skin and cut the meat into dice; put it in a dish and pour over it, several hours before using, three large tablespoonfuls of vinegar and one and a half of sweet oil beaten together and seasoned highly with salt and pepper. When ready to serve make a deep bed of fresh crisp lettuce on a dish and put the chicken in the centre of it, then cover the chicken with a rich mayonnaise, put bits of hard boiled eggs, capers, cold boiled beets and olives on top and it is ready.

CRULLERS.—A quarter pound fresh butter, one quarter pound powdered sugar, four well beaten eggs. Beat butter and sugar together, add eggs and then enough flour to enable you to roll them out; also one quarter grated nutmeg. Cut the paste into long, narrow pieces, cut a slit in the centre of each, twist the bars over each other and fry in boiling lard to a light brown, then drain them and dust them with powdered sugar.

COCOANUT APPLE PIE.—Pare some rich juicy apples and stew them until done; sweeten and flavor them with grated lomon peel. Line a deep pie-plate with a good paste, fill it with the apples and bake in a quick oven until just done, then have ready some grated fresh cocoanut, or crystallized cocoanut, spread it over the apple and cover with a meringue or not, as you choose, put in the oven for a few moments to heat the meringue or just brown the cocoanut. Eat cold

CHUTNEY SAUCE.—Peel and slice a dozen apples and let them cook very gently until they are nearly pulp, then add to them one half pound dates cut in small bits, with the stones removed, one half pound raisins stoned and quartered, four ounces shalots skinned and sliced, four ounces fresh Chili peppers, and two ounces green ginger. Mix six ounces of brown sugar with the same quantity of salt in an earthenware pan, and pour one quart of vinegar over. When quite dissolved, strain through a sieve, and mix all the ingredients together thoroughly; then put into a jar, and let it stand in the sun, or else let it stand on the corner of a warm hearth. It should not be used for six months.

PIE FOR LUNCH.

A WARNING AGAINST A GASTRONOMIC ABOMINATION.

I say unto such of you as would preserve intact the inside garments of your respective stomachs, choose with exceeding care the companions of your mid-day lunch. For pitch is not more likely to stick to whoever touches it than is abstemiousness to drop from one who consorts with pie-eaters and other cannibals. Heavy, even as heavy as the crust thereof, is the spirit of the devourer of pie at noon. And he who succumbs to the temptation of a plate of wheats is flatter than either the plate or the wheats. Therefore, when noon comes get ye to a bunnery; or, if you must needs go where pies are sold, take heed how you are accompanied. Verily, it is harder for a rich man to pass through a needle's eye than for an eater of sandwiches to resist the allurements of pie as flaunted before his face day by day by so-called friends. And once fallen from grace, no derrick of cast-iron resolve shall lift a man to the atmosphere of sandwiches and virtue again. As in the case of the first fall, the flavor of the forbidden fruit spoils the palate for that which is innocuous. Once I was gastronomically as pure as the beautiful snow, but I fell—through the machinations of one who called himself my friend. His plan had a devilish malignity about it that should be a letter of recommendation for him in hades. It was merely to eat pie beside me each day as I munched my plain sandwich, and to simulate in dumb show ecstatic delight in its savor. This plan breaks down the resolution by the slow and insidious process of undermining, and is much more effectual than any sudden coercion. Well, not to dwell on any ghastly details, I am now a pie-eater, within the full legal meaning of the term. Of such are the legion of pale spirits who hurry through the business streets at noon seeking pie and an early grave. They find the said pie, and the said grave finds them. If a million tallow-faced dyspeptics and a million unhonored graves attest the fatal work of the American pie, yet men there are who live and grow fat by means of it. These are the men who sell it to the men who eat it, and the men who write jokes about it for other men to laugh at if they (the other men) can. Thus the American pie is both filling and nutritious to those who refrain from eating it. It fattens the man who does not eat it and thins the man who does. And the grave fattens by both; in the one case by the greater number of its victims, and in the other by their greater rotundity.—*Hotel Mail.*

BEEF-TEA.

A WARNING AGAINST A COMMON DELUSION.

Commenting on the directions for making beef-tea, as laid down by a teaching professor, E. B. Ward, according to the *American Lancet*, says: "We take a pound of finely-cut beef and pour a pint of cold water on it, and let it stand two hours—while we write about it. The water is not near sufficient to cover the beef, but with occasional agitation we get at the essence; and at the end of two hours we find the meat surrounded by a reddish-colored liquid. Put a little of this fluid into a test-tube, and hold it in the flame of a spirit lamp. You see it coagulates to the extent of one-fourth, perhaps. What is that? Well, never mind now, we are going to make some beef-tea. Now we proceed to 'boil the whole.' He doesn't say how long, and it does not make much difference so long as the water holds out. Now 'strain and add sufficient water to make a pint.' You perceive that it is too strong, and has to be diluted. Let us take a little of this concentrated essence in a test-tube and examine it. Here is a translucent fluid with a bland taste, a neutral reaction, and a slight odor of beef. By closer inspection you observe little fine particles of sediment slowly settling. This, Pavy says, should be stirred up and given with the tea, but as it is only particles of coagula which have skipped through the strainer, let us have it out. If part of it ought to come out, it all should. So we will filter this liquid, and you will observe we have a limpid, almost colorless, fluid left, and a slight deposit on the filter. What is it? Well, we shall see shortly. Now take a little of this liquid in a test-tube, and drop a few drops of nitric acid into it. There is no precipitate formed, so we know there is no albumen or fibrin in it. What is in it? Well, there is a little saline matter, and—a world of disappointment to any one who tries to sustain life with it. That is about all. Why? Well, the thing is too absurd to talk about. Common well-water, containing the average amount of bacteria, is more nourishing. Thousands of sick people have been starved to death on this diet, and I want to enter my solemn protest against it before it is everlastingly too late. What you want is the albumen and fibrin of the meat in a condition requiring little digestive power and that will be readily assimilated. The moment you coagulate these ingredients by heat you render them practically indigestible. These, however, by this process are mostly strained out, and the fluid left is inert, or nearly so. Good milk is preferable always, but if you must give beef-tea, never boil it. Liebig says 120 deg. Fahr. is the highest temperature to which it should be subjected. It is not very inviting in its general aspect, but it holds in solution the ingredients that you want, and which are rendered useless for a weak digestion by boil-

ing. Liebig's plan is to add a little hydrochloric acid. Perhaps there is nothing in the whole round of dietetics, however, that holds so much real, needed food in a given space as good, rich milk punch—teetotalers to the contrary notwithstanding.

ART AND CRITICS.

AN EXPLANATION OF SOME SEEMING ANACHRONISMS OF THE OLD MASTERS.

In all departments of art the world loses much by reason of the interference of strangers between the artist and those to whom he addresses himself. These strangers are called critics, who profess to be interpreters between art and the people. In general they are dull fellows, who have a notion that all art language is one and the same, and most of them seem to think that in every picture the artist says only "look at this and see how well I have done it." Hence comes the rubbish called criticism which so much abounds, and which not only hampers art but misleads people and prevents their enjoyment of and instruction by works of art. There are necessarily difficulties in learning the languages which artists have used. For every one who intelligently addresses others in writing or in picture endeavors to use a language which they understand. There is a great variety of languages in a gallery of pictures, analogous to that in a collection of books. The language of pictures is not only different according to period and country, but is often dialectic and local. The simplest illustration of this is found in caricature, whose force depends often on the local events of a passing period, and which may be as unintelligible in remote times or places as is Sanscrit to a school-boy. So Chinese or Japanese art conveys few if any ideas to western minds. And so too a large portion of the art production of the fifteenth and sixteenth centuries in Europe presents difficulties to the nineteenth century mind not altogether unlike those found in the literature of the same period. There is a prevalent characteristic of European pictures of that period which has caused many critics to stumble. They are constantly finding fault with what they call anachronsims in them. In almost every case there is no anachronism, and the trouble is that the critic does not understand the language of the artist, and misapprehends what he made the picture to teach or tell. Take an example. In Durer's series, commonly called the Life of the Virgin, is a remarkable cut, which is known as The Birth of the Virgin. It represents the interior or Nuremburg house of Durer's time, with all the ordinary furniture and surroundings of his period. The people are Nuremburg people and the entire scene and scenery must have been familiar to his contemporaries. Critics speak of this as strange anachronism. Jackson and Chatto, in their treatise on the History of Wood Engraving (a work abounding in error, misinformation and dogmatism), cite the cut as a "striking example of the little attention which Durer, in common with most other German painters of that period, paid to propriety of costume in the treatment of such subjects." "The piece is Hebrew," they continue, "of the age of Herod the Great; but the scenery, dresses and decorations are German, of the time of Maximilian I." This criticism is of course intended to suggest to the reader that the critic knows what costume and scenery the author should have used. But a moment's reflection will convince you that he knows nothing about it, and that no one knows what kind of a room, decoration, furniture or clothing were properties of Joachin and his neighbors. But is it not very clear that the criticism which says "the piece is Hebrew" cannot be exact when there is nothing Hebrew about it; and especially when the artist was working for a Christian people, and the subject is one in which Christians of his time had very great interest and Hebrews no interest. Whatever Hebrew relations the birth of the Virgin had are carefully left out of the picture. You must ask the artist himself what he means by the picture. You can certainly see very plainly what he did not mean. He did not say: "This picture represents the circumstances, room, dresses, people, furniture, which surrounded St. Anna when her child Mary was borne in the days of Herod." Durer was not only a great artist, he was a man of learning, read Greek and Latin, was a scholar in a social circle of scholars. He knew as well as any modern critic that this picture did not represent to the eye anything ancient. There is no anachronism in the picture itself Anachronism is a confusion of facts, or of dates of facts. There is no confusion. Everything in the design is synchronous. The artist so intended it. The purpose of the artist must have been served by this intent and its execution. I have made distinct the doctrine that all pictures are language. This is the lesson of the present discussion. You and I are not Nuremburg or German people of 1511 and are not the people to whom Durer spoke in picture. Even the most learned Germans to-day cannot agree on the meaning of passages in his written letters. The German spoken and written language has undergone great changes. So has the picture language. Perhaps in this picture there are hints, allusions, suggestions, quite intelligible in 1511, quite lost to us. Why, for instance, does that pretty and graceful young girl stand so prominently among the matrons? Why is there only one candle in the candelabrum and that not lighted? But the language of art is in many respects intelligible to all ages; and perhaps it is in this that the greatness of art consists, its intelligibility and forcible address to generation after generation. There is no possibility of misreading some of the great lessons in this picture, if you exercise your good sense and ability. An ordinary description, a reading aloud of the picture, in our English language may help you to know what Durer meant to say. Try it. In a large room, each detail of household furnishing being given, are fourteen persons, twelve women and two children. One of the women seated apart from all the others on a bench which is in fact the projection of an old chest, holds in her lap a new-born babe. None of the others look toward the babe or are in any visible way concerned about it or interested in this babe. Nothing in the room, the scene, the action or motive of the picture, implies that the babe is an important feature of the occasion. The women are variously occupied, in gossiping, drinking beer or wine; one is asleep, two minister to the mother lying in her bed in the background. In brief, the neighbors, her friends, have, in Nuremburg fashion, come to be with the mother, the child is born, the mother is doing well, all are happy, and the child has commenced life, just like all human children, among the ordinary surroundings of human life. The picture, thus far, says plainly that there was nothing extraordinary about the occurrence itself, the coming into the world of this little daughter of Anna, wife of Joachim. But there is another and the dominant part of the picture. The lofty room rises into another world. A cloud rolls over the gossiping group and hides from them what the artist reveals to you above it, the Angel of the Apocalypse, holding the golden censer wherewith to offer the prayers of the saints. The birth which does not attract to the child even a look from one of the gossiping attendants, is nevertheless an event which affects the relations of earth to heaven, and has to do with the whole Christian faith and family. Whether Durer intended to express any opinion on the mooted doctrine of the Immaculate Conception, or to indicate his views in any particular about the office of the Virgin Mother, it is not possible to affirm. The picture is equally acceptable to Protestants and Romans in teaching that the daughter of Anna was she whom all generations would call blessed. You will find a similar explanation of much that is called anachronism in old art. Thus the pretence of cannon and other modern arms in Strasburg, and other editions of Livy, is certainly not due to any ignorance on the part of artists or people. The same cuts were used over and over in successive editions, without provoking censure. It is clear that the idea of these pictures was not to illustrate the scene, but to illustrate some thought, such perhaps as the mere general idea of war, a battle, a siege. This is more probable because for full a century after books were first printed the insertion of pictures was often quite as much for the mere sake of ornament as for the sake of illustrating the text. The frequent repetition of the same picture in different parts of a book is thus easily explained. In the earlier books, down to the Durer period, every picture which appeared in a book was unfinished till the painter had finished the coloring. Neglect of this fact makes worthless the criticisms of Chatto and many other writers on early wood engraving. There is deep interest in studying the gradual change which took place in the pictures as the purpose of illustrating the text overcame the old purpose of ornamentation of the book.—*Correspondence Journal of Commerce.*

OBSERVATION.

THE ADVANTAGE OF KEEPING ONE'S EYES AND BRAIN IN CLOSE SYMPATHY.

The late Henry Ward Beecher once said that he never saw anybody do anything without watching to see how it was done, as there was no knowing but that some time he might have to do it himself. This habit of observation once served him in good stead. "I was going," he says, "across a prairie when my horse began to limp. Luckily, I came across a blacksmith's shop, but the smith was not at home. I asked the woman of the house if she would allow me to start a fire and make the shoe. She said I might if I knew how. So I started the fire and heated the shoe red hot, and turned it to fit my horse's foot, and pared the hoofs, and turned the points of the nails out cunningly, as I had seen the blacksmith do, so that in driving into the hoof they should not get into the quick, and I shod the horse. At the next place I went to I went straight to a smith and told him to put the shoe on properly. He looked at the horse's foot and paid me the greatest compliment I ever received in my life. He told me if I put on that shoe, I had better follow blacksmithing all my life. Now, I never should have known how to do that if I had not looked on and seen others do it." Another writer on the same subject says: Every one should cultivate the faculty of observation. If he does so designedly, it will not be long before he will do so unconsciously. It is better to learn a thing by observation than by experience, especially if it is something to our detriment. One would prefer to know which is the toadstool and which is the mushroom by observation rather than by experiment, for the latter might cost him his life. There is hardly a vocation in which observation is not of great service, and in many it is absolutely essential. It adds to the proficiency of the chemist, the naturalist, the mining expert, and the bushman. Observation quickens experiment. It leads to inference, to deduction, to classification, and thus theories are formulated, sciences established. An observing boy will become an observing man, and, as boy and man, he will have an advantage over those who have not cultivated the faculty. He knows a thousand things that the unobservant boy does not know. He does not get the knowledge from books or from others, but acquires it for himself, through the use of his eyes and ears, and properly appreciates it for that reason. A child may know more than a philosopher about matters that may not have come under the observation of the philosopher. A little girl entered the study of Mezerai, the celebrated historian, and asked him for a coal of fire. "But you haven't brought a shovel," he said. "I don't need any," was her reply. And then, very much to his astonishment, she filled her hand with ashes and put the live coal on top. No doubt the learned man knew that ashes were a bad conductor of heat, but he had never seen the fact verified in such a practical manner.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. MCGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

CATARRH
Sold by druggists or sent by mail. 50c. H. T. Hazeltine, Warren, Pa.

Galileo noticed the swaying of a chandelier in a cathedral, and it suggested the pendulum to him. To another inventor the power of steam and its application was suggested by the tea kettle on the stove. A poor monk discovered gunpowder, and an optician's boy the magnifying lens.

BUSINESS NOTES.

GOOD FOR ALL THREE.

The greatest good for the greatest number is the mark aimed at by all reformers, and to reach it secures the greatest acclaim of fame that can be had. It is a good thing for the consumer, for the manufacturer, for the newspapers, when an article of merit is put upon the market, is made known by newspaper advertising, and, through a series of years, proves its worth to lessen labor in millions of homes, profits the newspapers, and gives its makers a fair living. Pearline, the great washing powder manufactured by James Pyle & Sons, New York, has done all this. If it is not making labor easier in your home, it is your fault. Something of its history is made plain in an advertisement in another column.

ARCTIC PROGRESS.—A telephone line about five miles long has been established in Iceland, and is regarded as a great curiosity, being the first ever established on the island.

ANCIENT DRILLS.—Recent investigation into the curious question of the use of an annular drill by the ancients lead to the conclusion that jewel points were used in both drilling and sawing.

TO MAKE ROSES BLOOM.—Scrape from the chimney or stove-pipe, where wood is used for fuel, a quantity of soot. Put into a vessel and pour boiling water over it. Let stand for a few days, and then use the liquid to water the earth around the plants. The application should be made every two or three days.

TO REMOVE INK FROM CARPETS.—First take up as much as possible of the ink with a teaspoon. Then pour cold sweet milk upon the spot, and take up as before, pouring on milk until at last it becomes only slightly tinged with black. Then wash with cold water, and absorb with a cloth without too much rubbing.

ARTIFICIAL MALACHITE.—Artificial malachite, capable of receiving a fine polish, and closely resembling the natural stone, is made by precipitating, in the cold, a solution of cupric sulphate by potassium or sodium carbonate. Let the whole stand until the precipitate has settled completely and cohered, then dry with gentle heat. The resultant mass may be cut and polished by any methods.

TO CLEAN GLOBES.—If the globes on a gas fixture are much stained on the outside by smoke, soak them in tolerably hot water, in which a little washing soda has been dissolved. Then put a teaspoonful of powdered ammonia in a pan of lukewarm water, and with a hard brush scrub the globes until the smoke stains disappear. Rinse in clean cold water. They will be as white as if new.

ALCOHOL IN OILS.—Take a slim glass tube eight or ten inches in length, closed at one end, and as large as your finger. Put in an ounce or two of oil, paste a piece of paper on the outside of the glass, so that its lower edge will be even with the top of the oil, then add two or three times as much soft water, and shake well for a few moments. When it has settled, in an hour or so, the water will have absorbed the alcohol from the oil, which will show proportionately below the line first fixed.

TO STAIN MARBLE.—Marble may be stained different colors by using the following substances: Blue, solution of litmus; green, wax colored with verdigris; yellow, tincture of gamboge or turmeric; red, tincture of alkanet or dragons-blood; crimson, alkanet in turpentine; brown, tincture of logwood; gold, equal parts of verdigris, sal ammoniac, and zinc sulphate in fine powder. The marble should be not quite polished, but made perfectly smooth, and ready to receive the highest finish before the stain is applied. The longer the stain is left in contact the better the result.

LACTITE.—A new material called "lactite" has recently appeared in England as a substitute for bone or celluloid. Casein is the principal constituent.

POWDER AND ELECTRIC LIGHT.—The national powder mill at St. Médard-en-Jalle, in France, has recently been lighted by incandescent lamps, and is believed to be the first mill of its class on the Continent to use electric lighting.

ROBUST ZEPHYR.—It is stated that in a recent gale the anemometers on the top of the Eiffel Tower registered 630 miles per hour. M. Mascart says that had this velocity occurred at the level of the city every chimney would have been leveled to the ground.

RUNS IN THE FAMILY.—Domestic troubles and divorces seem to run in families like some hereditary disease. In one family in Atchison, Kansas, the grandparents quarreled all their lives, the mother and father have separated, and four of the six married children have been in divorce cases.

PORTABLE STORAGE BATTERIES.—Ordinary accumulators or storage batteries for electrical work are not very portable, owing to the liquids they contain. In consequence of this trouble it has been proposed to add a little sodium silicate to the cell, which has the effect of turning a sulphuric acid solution into a jelly.

GOOD TO REMEMBER.—A blush is a temporary erythema and calorific effulgence of the physiognomy, ætiologized by the perceptiveness of the sensorium when in a predicament of unequilibrity from a sense of shame, anger, etc., eventuating in a paresis of the vaso-motor nervous filaments of the facial capillaries, whereby being divested of their elasticity, are suffused with radiant, aerated, compound-nutritive circulating liquid, emanating from an intimidated præcordia.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Jan. 26, 1891.

The following are the market prices to-day at New York.

	New York.
Prime Hay	65c. @
No. 1	60 @
No. 2	50 @ 55
No. 3	45 @ 50
Shipping	45 @
Clover mixed	45 @ 50
Clover	40 @
Prime Rye Straw	95 @
No. 2 "	75 @ 85
Short "	60 @
Oat and Wheat	50 @

Receipts week ending Jan. 24, as follows:

Via N. Y. Central	206 cars.
" West Shore	119 "
Other roads by Lighter, 34th Street	19 "
Total	344 cars.
Total last week	454 "
Decrease	110 "

Very little can be said to change the tone of last week's report, except that shipping grades or even a poorer quality is in better favor and sells more readily, partly on account of its being scarce, and also a greater demand for that kind of stock just now. A peculiar feature is noticeable in the present market on hay grading No. 2 or fair No. 1, as it is difficult to get a price proportionate as to quality between shipping and No. 1 or fancy.

Perpetual pressed hay still dull and selling from 45c. to 55c.

Rye straw in good demand and selling freely at quotation prices.

These names are arranged alphabetically.

HOSMER, CRAMPTON & HAMMOND,

NO. 43 COMMERCIAL STREET,

BOSTON.

COMMISSION MERCHANTS,

HAY, STRAW, FLOUR & GRAIN.

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$14.00 to $15.00
Hay, choice to fancy, perpetual pressed bales	13.00 to 13.50
Hay, fair to good	11.50 to 12.50
Hay, poor to ordinary	9.00 to 11.00
Hay, Clover and Clover mixed	9.00 to 11.00
Hay, swale	9.00 to
Straw, Rye, good to prime	17.50 to 18.00
Straw, Oat	9.00 to 10.00

BOSTON, Jan. 26th, 1891.

Receipts for the week are 356 cars of hay and 36 cars of straw; corresponding week last year, 187 cars of hay and 19 cars of straw. There is little change to note in the general condition of the hay market from a week ago. Receipts continue in excess of the demand. The market is dull and weak in consequence. Quotations are nominal, as receivers are anxious to move stock, and frequently shade prices in order to do so. Rye straw is steady at quotations.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

HYGIENE UNDER A NEW NAME.

The approaching International Congress of Hygiene and Demography, which will be held in London, is the subject of a document just issued under the signatures of the Duke of Westminster and the Presidents of half-a-dozen of the leading scientific bodies of England. The last of these congresses was held in Vienna, and five of them had previously been held in other European capitals. At the Vienna Congress there were 2,000 members, and nearly all civilized countries were represented in it. The Prince of Wales will be the President of the London Congress, and a large number of European universities, scientific societies, and other public bodies have appointed delegates to it. The object of the Congress, which will be in session from the 10th to the 15th of August next, is to promote the interchange of knowledge between those persons in different countries interested in the study of hygiene and demography. The Duke of Westminster gives six branches of inquiry; (1) The means of preventing communicable diseases; (2) the science of bacteriology in relation thereto; (3) industrial questions from a health point of view; (4) the hygiene of childhood; (5) the hygiene of houses and towns; (6) State hygiene, or the duty of the Government towards the nation in regard to health and the machinery necessary for exercising that duty. "Demography" is a word of modern coinage intended to represent and include such themes as are here indicated. The London *Times* speaks of this Congress, and says it is likely to be useful, because some of the delegates to it will be sent by Governments possessing power to carry into effect any reforms of the necessity of which their representatives may become convinced. Delegates will be sent to it from the United States by various scientific, collegiate, and other corporate bodies.

PAN-AMERICA AT CHICAGO.

A government expedition to South America in behalf of the World's Fair is on the point of starting. Ten officers, four from the army and six from the navy, who are going as commissioners, have been attending for the last few weeks a sort of primary class in the Smithsonian Institution, in Washington. As their duty is to collect material of every possible description for the Exposition, it was necessary that they should have a rudimentary acquaintance with certain arts not ordinarily taught at West Point or Annapolis. It is designed to secure a great Pan-American Exhibition at the Chicago Fair, that shall be in its nature two-fold commercial and historical. It will illustrate the progress of civilization in the republics of South America, Central America, and Mexico, by showing the condition of those countries at the time of their discovery by the Europeans, and by tracing their development since that period. Pictures are to be given by means of lay figures, costumes, houses and industries represented of those peoples which are least civilized at present, because they will afford the best glimpse obtainable of the life on the continent centuries ago. Also, the amplest showing is to be given the resources and industries of these regions now, and incidentally are to be displayed all things which our neighbors towards the south produce and have to sell. The Commissioners will carry letters from the Department of State at Washington to the respective Governments, the work being so divided that one officer attends to Peru and Bolivia, another to Chili, and so on. It is hoped that many of the republics will be disposed to put up their own exhibition buildings, for which space is to be reserved. For such of them as are not so inclined all the room they want is to be provided at Chicago in a structure to be erected for the purpose at Uncle Sam's expense. The delegation will communicate with museums, scientific societies, and botanical gardens with a view to securing collections from them. They will advertise, for the benefit of the public, the objects they are working for, and will make some purchases in addition. Congress is expected to appropriate a considerable sum for buying collections, historical and ethnological. Efforts are to be made to secure the attendance at the Exposition of native artisans. From the squeezes secured in papier mache of sculptures and inscriptions, plaster productions are to be turned out at the Smithsonian.

CHEAPER QUININE.

The recent convention of quinine manufacturers held in London and Paris exerted a marked influence upon the market price of that widely-used drug. Formerly quinine sold in this market at $4 and $5 per ounce. This was when the product from which it was manufactured was procurable only in the forests of South America in its wild state. The prominence assumed in the *materia medica* of the civilized world led to experiments in cultivation, with the result that the product was increased many fold. Prices, in consequence, sensibly decreased, and the manufactured article was brought within reach of the consumers at a greatly reduced rate. This diminution in price was further accentuated by the removal of duties by the revision of the tariff several years since. Some New York manufacturers have, we understand, taken up the task of reducing the cost of quinine to the minimum. The drug can now be bought in limited quantities at what has heretofore been wholesale rates; that is to say, instead of being obliged to pay one per cent. or more per grain, the purchaser of quinine can now procure an ounce, or 480 grains, Troy weight, of the manufactured product of guaranteed quality at from 25 to 30 cents, according to the character of the package in which it is put upon the market. In view of the wide extent to which quinine is employed, this concession is a boon to the purchasing public of inestimable value.

ADULTERATED WINE.

It may interest the public to know that the New York statute prohibiting the manufacture and sale of adulterated wine defines pure wine as the fermented juice of undried grapes, or other undried fruits; provided, however, that the addition of pure sugar to perfect the wine, or the addition of pure distilled spirits to preserve it, not to exceed eight per centum of its volume, or the using of the necessary things to clarify and fine the wine, which are not injurious to health, shall not be construed as adulterations, but such pure wine shall contain at least 75 per centum of pure grape or other undried fruit juice. Manufacturing for sale or selling impure and adulterated wine is made a misdemeanor, punishable by a fine of $200 to $1,000, or by imprisonment from six months to a year, or both. The offender is also liable to a penalty of one dollar for each gallon manufactured, sold, or offered for sale, and the wine is declared a public nuisance and forfeited to the State. Any wine containing between 50 and 75 per cent. of pure grape or other undried fruit juice, and being otherwise pure, is to be known as "half wine,"

COLGATE'S COLEO.

A PURE PETROLEUM PRODUCT FOR TOILET AND MEDICINAL USE.

and the words "half wine" must be branded on every package. Wine containing less than 50 per cent. of pure grape or other undried fruit juice, and otherwise pure, is to be known as "made wine" and so labeled. To sell any "half wine" or "made wine" without the proper label or brand, is a misdemeanor, punishable by a fine of $200 to $1,000, or imprisonment from three months to a year, or both. The provisions of the act do not apply to medicated wines, such as are put up and sold for medicinal purposes only.

DINNER TALK.

WHAT SHOULD BE EXPECTED OF DINNER PARTY GUESTS.

A dinner can have but one object, the entertainment of all present; but it is at once a necessity and a pleasure, and the time devoted to it is profitable to man physically and mentally. It is the dividing line between the day of work and worry and strife and the evening of ease and quiet and friendly intercourse. It is a time of relaxation, when the past is forgotten and the future ignored. The present is sufficient; no thought is taken for to-morrow; let it come with its attack of indigestion and feeling of general destruction, but let it come unheralded. For this reason one should come equal, physically, to the feast. If you come unequal to the exertion the dinner will be ruined for you as well as for the others. There is a little French vaudeville which illustrates this idea. In the play are two women, rivals. One issues an invitation for a dinner in honor of a small social victory, the other is compelled to conceal her chagrin and accept the invitation; in doing so she sees her revenge. "Yes, I'll go," she says, "but I'll ruin her dinner." *Je me trouverai mal au dessert.* If you are at all ill you had best stop at home and deny yourself the pleasure of ruining your host's dinner. By the pleasure of accepting the invitation you do not stipulate to eat all with which you are served; common sense rules all things. Probably you remember Dr. Johnson's way of disposing of an indisposable hot morsel. He ejected it from his mouth, saying to his hostess, "Madam, a fool would have swallowed that." The clever remark and the common sense was no excuse for the vulgarity; the example is not one to be followed with hot morsels, nor with disliked ones. Whatever is served of the course on a plate accept; eat of it if you like. The dishes that are passed you can decline. You do not offend in displaying a choice; no wisdom is worse than that which dictates the trying to eat of that which does not agree with you. Sending away an empty plate is no longer required as an evidence of one's good table manners, but the heaping of a plate is undoubted evidence of the want of them. Equal with the fallacy that all men can eat the same thing is the fallacy that all men can talk the same thing. A one subject dinner at which men and women meet is an absurdity. A dinner with one subject for conversation might be paralleled with a dinner with one article of food. People have been dining since the world began in just one way, and that way is going to continue; it is each man for himself. Fashion will introduce innovations, but they will only be seized by the Athenian element, *i. e.*, those who are continually running about to find or hear some new thing. A Browning dinner presupposes an equal love, admiration, and knowledge of the difficult poet and his difficult verse. If every one present holds the same opinion there is no use in discussing the subject at all; it is finished before it is begun. If you invite people who dislike your favorite poet you can no longer talk him, you must argue and convert. The advice given by the father of Contarini Fleming to his son, in Disraeli's book of that name, is: "Never argue. In society nothing must be discussed. If any one differ from you bow and turn the conversation—or you may say many disagreeable things." The seriousness of a debate cannot assimilate with the pleasantry and high-art cookery of a dinner. The person who has adaptibility, quickness, and discretion can talk easily, well, and interestingly, and yet have neither depth nor book knowledge; the lack of both is not betrayed in general conversation. Ignorance is never to be commended, but it becomes attractive if one adds to his natural abilities the power of listening. A man or woman possessing such traits, such a power, and a sunny disposition, is to be envied, and invited as a valuable assistant at all successful dinners. The one-subject idea is limited to the public banquet for men; even then the subject is one for speeches and not for conversation. We have not all had the questionable pleasure of a dinner with Browning for a subject, but of the idea most of us have had examples. We can all testify to the exasperating detail and deadly tediousness of a meal that has been all children, or servants, or dog, or horse, or reform, or scandal, or all anything else. One person can hold the attention of many by the relation of anecdotes, personal adventures, or reminiscences of public events, but even then to the subject must be added a pleasant voice and manner and a certain amount of personal magnetism. A dinner can be made only one of a kind by the inanimate and still-life present. It can be made one of a color, the shades for the lights and other accessories being of one tint, or of one flower, when only one variety is used in decorating—and this should always be the case—or character can be given, as in a hunt dinner, by employing certain devices in decorations for the table, and the cards to be kept "in memory of" illustrating scenes from the "view to the death in the morning," or the serving of one species of food, as a game or fish dinner. A dinner dance is an idea imported from England and improved on here. It ranks with many of the good things that are amusing and fascinating because they are bad. It is directly opposed to all accepted hygienic rules. "After dinner, rest a while." The repose under the table, of which in the good old days that are gone we hear so often, when men drank hard and deep, seems much more in the order of things. The dance after a dinner is often a punishment of pleasure. The dinner dance is only a reception with several hostesses instead of one and the eating preceding instead of following. It has brought about one change. If one must dance one must have dancing legs, consequently young people must replace their elders at the festive board, and they naturally welcome the change with delight. To be invited to dinners is an advance to a certain grade of social distinction and recognition for which débutantes hope and to which they look forward. A dinner has become much more an affair of amusement than it formerly was. No longer do the "buds" add to their litany, "From a dinner deliver us." They want to be asked to dinners; the invitation implies a selection. They feel they are recognized as women with minds. Most older people like this leavening of youth. They no longer wish to be left on the shelf of reverence; they want to reach back and assimilate themselves with youth and to be youthful. One happy change the dinner dance has brought about—the meal can no longer drag itself wearily along by the hour; it must stop some time; it must have a reasonable limit. There is one thing that has gone out of vogue that might easily be restored to the private dinner party—that is the toast. It does not necessitate increased drinking nor make excuse for it; it is more a cause for scintillating wit, sparkling like the wine in which it is drank. It is a chance for the brilliant and ever-ready; the clever speaker is applauded and rewarded with smiles and laughter. The brevity of a toast is its first recommendation. This advice of a member of Congress should be followed: A man rose and began his toast by saying "I do not know what to speak about." "Speak about a quarter of a minute and sit down," was the member's friendly advice. As the toast can be easily restored without any undue and boisterous hilarity the after-dinner story might easily be suppressed or abreviated. It is more of an excuse for the heavy drinker than an occasion for the *raconteur*, although the women who sit in the glory of a great drawing room and listen to the shouts of ringing laughter, cannot doubt the repeating of clever stories. These, however, might just as well be reserved for the club. It is not that the women are pining and miserable in the drawing-room, though many may be knowing the ways of their lords—they get through the time admiring each other's fine gowns and exchanging details of every-day life. There are some women who do not mind remaining with the men while they smoke, and listening to stories a little bit "French," but it would be more to their credit if they did mind. The story-telling is just one of the things in this world that had best be left undone. A five minute's smoke may be lengthened to a quarter of an hour, but that is time sufficient. The men should then be ready to join the women in the drawing-room for coffee. Where coffee should be served after dinner is a matter of choice. If served in the drawing-room it allows a display of pretty china and silver, and a graceful woman has no better chance for showing her grace than when pouring coffee or tea. It is an easy excuse for sending for the men and thus ending their story-telling. The privilege of being entertaining at a dinner is equal to men and women. A woman naturally has not the fame as a diner-out that a man has, her duties at home and at her own table often preventing the acceptance of an invitation. One only gains such a reputation by being seen wherever "two or three are gathered together." A woman instinctively and sympathetically takes her cue from the surroundings. She who is envied as one who "gets on so nicely" recognizes the fact that all the world loves to talk and that each individual has a favorite topic. If a woman is to be pleasing to a man she must be an intelligent and appreciative and suggestive listener. She must be intuitive enough to find his subject, and, when found, unselfish enough to listen. All men love to talk on their own subjects. A woman's charm is in her power to please; to please she must be unselfish; in proportion to her unselfishness and intuitiveness is she charming. In this she leads when apparently following. She can be brilliant with delicacy and talk at our American table without running the risk of being snubbed, as one of our women was at an English table. She illustrated Carmen Sylvia's thought: "You can only be witty when those around you are witty too. The cock crows in vain to the ducks; they do not understand him." Surrounded by men of talent who talked well, she talked well herself. Thoroughly engrossed, she did not observe that the other women at the table talked little. After dinner the adoring wife of a literary gun voluntarily enlightened her on the ways that were strange, telling her it was thought "very bad form for women to talk much at table." If the

English idea is not to be followed the Germans can furnish a pretty one that can be followed; it relates, too, to a subject that puzzles many—the asking of grace. It is never out of place at the beginning of a dinner, but it is often omitted. This pretty habit all who have traveled in Germany and observed will remember; it is practiced even at the table d'hote of the hotel. It is a variety of blessing that follows instead of preceding the meal; each guest, on rising from his or her chair, turns first to the right, then to the left, and, bowing to each neighbor, repeats these words: "Gesegnete Mahlzeit;" an easy translation of which is, "Blessed be this meal."

AMBERGRIS.

WHAT IT IS AND WHAT IT HAS BEEN SUPPOSED TO BE.

A collection of facts and opinions from various scientific sources in regard to ambergris may prove interesting, if not instructive, as most of us, unless having access to an extensive perfumery department, know very little about it; being but rarely used in medicine, indeed many have never seen it. The substance derives its name from the French *ambre gris*, *i. e.*, gray amber. Amber is taken from the Arabic *anbar*, *qnbarum*, a kind of perfume, but originally the name of a fish from which it was believed that ambergris came. This leads us at once to consider its origin.

Many ridiculous hypotheses were started from time to time to account for its origin. Among others it was conjectured to be the solidified foam of the sea; fungoid growths in the ocean similar to fungi which form on trees; excreta of sea-birds. Some supposed it to be a vegetable production of the same nature as yellow amber. In the sixth voyage of Sinbad the Sailor, he says: "Instead of taking my way to the Persian Gulf, I traveled once through several provinces of Persia and the Indies, . . . and embarked." Shortly afterwards they were wrecked, and describing the place, Sinbad says: "Here is also a fountain of pitch and bitumen, that runs into the sea, *which the fishes swallow and vomit it up again, turned into ambergris.*" That the gray and not the yellow amber was meant is proved further on by the statement that he gathered many precious stones and ambergris to take away with him, showing the value even in those days. It may seem childish to refer to such fables, but we should remember that these stories embodied the belief of the Moslem people five or six centuries ago. It is a great pity that Shakespeare, who touches upon almost every subject on earth, should have omitted to give us his views on ambergris, as it would have been the expression of popular contemporary opinion. He mentions amber frequently, but refers to the yellow. According to Webster the word "amber" is occasionally used as synonym for "ambergris," and in such we find it employed in an old play about the middle of the seventeenth century, written by Beaumont and Fletcher—

"You that smell of amber at my charge," etc.

The true source was satisfactorily established by Dr. Swediaur in a communication to the Royal Society. It was found by him that ambergris very frequently contained the horny mandibles or beaks of the squid (*Sepia moschata*) on which the sperm whale is known to feed. That, observed in connection with the fact of ambergris being taken from the intestines of the whale, sufficiently proved it was formed inside and not extraneously. Ambergris is now regarded as a morbid secretion, probably derived from the bile, and is by some thought to be the cause, rather than the effect, of the sickly condition of the whale. Capt. Buckland, Hamburg, and G. W. Septimius Piesse uphold the theory that the substance is nothing more nor less than the fæces of the sperm whale under certain condition and food probably stoppage, which might account for the ambergris found floating in pieces of various sizes on the coast of different countries, particularly in the southern hemisphere. The *Physter macrocephalus* (Linnæus) or Great-headed Cachalot, belonging to the class Mammalia, order Cetacea, is principally met with in the Pacific and Indian Oceans and the seas of Australia. It is fifty to seventy feet long, with a head fully one-third of its entire length and correspondingly thick. The jaws are supplied with twenty-five long tusks, each weighing as much as two pounds and being eight inches in length. Thumberg, in his history of Japan, vol. ii., p. 48, tells of a very good piece of fine ambergris, found upon the coast of Kijnoknur, which weighed about 100 cattis Japanese, or about 130 pounds Dutch weight; and being much too large to be purchased by one person, it was divided into four parts, in form of a cross, and one of the parts was tendered him. In 1693 a piece of ambergris weighing 185 pounds was sold by the King of Tidore to the Dutch East India Company for £2,000. It was bought on the condition of its being the genuine article. It was sent the following year to Amsterdam, and was kept in the company's museum, where it was seen and described by several Dutch writers. An American fisherman from Antigua found inside a whale, about fifty-two leagues southeast from the Windward Islands, a piece of about 130 pounds, and sold it for £500. One whale has been known to yield 750 pounds of this product. Ambergris, according to Stille and Maisch, comes in irregular pieces, varying considerably in size; is opaque, of a gray or gray-brown color, with lighter and darker colored streaks and spots; lighter than water; friable in the cold, but softening when held in the hand. It is of a waxy appearance, fusible in hot water, mixing with melted fats, and soluble in volatile oils, ether and hot alcohol. It is incapable of forming soaps with alkalies. It has a peculiar fragrance and is nearly tasteless. When freshly taken it is of soft consistence and of disagreeable odor, but gradually hardens and becomes paler. It consists mainly (about 85 per cent.) of a fatty substance resembling cholesterin, which Pelletier and Caventou have named ambrein. The remaining constituents, according to John (1818), are some balsamic matter, chloride sodium, benzoic acid (which is called into question by the Nat. Disp.), and coloring matter. Some of the adulterations are benzoin, laudanum, meal, etc., scented with musk; it is, however, very difficult to counterfeit ambergris, as the spurious article is easily detected by its physical properties. Formerly ambergris entered into many officinal preparations, and is still retained in some European pharmacopœias. The French Codex directs 10 parts to be macerated with 100 parts of 80 per cent. alcohol. Stanislas Martin suggests that it should be previously finely powdered by trituration with washed sand. In medicine it was used formerly, like other strongly odoriferous animal products, to produce stimulant action upon the nervous and circulatory systems, with a special direction to the generative organs. It was used in low fevers and spasmodic disorders, especially of the hysterical sort, and often associated with musk, castor and valerian. It was prescribed in substance in the dose of from 5 to 20 grains, or more frequently in ethereal solution. Dr. Swediaur took 30 grains of it without perceiving any sensible effect. Its present employment is principally in perfumery, to give permanency to very fleeting scents, as it undergoes slow decomposition and possesses very little volatility. Both musk and ambergris cling pertinaciously to woven fabrics even after passing through the lavatory ordeal, and are therefore added to perfumes to make them "last." A tincture for use of perfumers may be made by rubbing up one ounce ambergris in an iron mortar with two ounces of loaf sugar until finely powdered. Put into a tightly closing bottle and add gradually four pints cologne spirits: macerate in a moderately warm place for a month in order to facilitate solution.—*Pharmaceutical Record.*

GAS AND VAPOR.—Faraday's definition that "gas is the vapor of a liquid at a temperature above the boiling point of that liquid" holds good to-day, the lapse of time having shown no necessity for altering it.

CONTEMPORARY GHOSTS.

THE BELIEF IN SUPERNATURAL APPEARANCES NOT YET EXTINCT.

The recent report of the appearance of a ghost in an Irish city may have served to remind some readers of Scott's assertion, made more than fifty years ago, that "the increasing civilization of all well-constituted countries has blotted out the belief in apparitions." It may be that such a belief is more uncommon now than it was a century ago; but even that is doubtful. There are thousands of people in our own country—and Sir Walter would, perhaps, admit that it is fairly "well-constituted"—who are convinced that disembodied spirits are able to communicate with a certain class of persons who have not yet "shuffled off this mortal coil." There are among us professional mediums who undertake, for a moderate consideration, to put inquiries in correspondence, not only with departed relatives, but also with the most illustrious of the dead whose names survive in history. In this respect, indeed, there has been a change, or an advance in the conditions requisite to the observation of these very strange occurrences. Witches, wizards, necromancers, sibyls and soothsayers have never been absent from the world; but their number was never so great in any former age, and never before were their services so generally and easily available. It is to be remarked, however, that belief in the reality of these alleged spiritual manifestations is not confined to those ignorant or half-educated persons whose natural tendency is towards credulity and superstition. Mr. Andrew Lang says: "The believers in a religion based on pretended communications from the dead are numbered in America by millions. (?) Their opponents say that their faith and practice help to fill the lunatic asylums, to which they easily reply that theirs is not the only creed that gives occasion to religious madness. Men of sense and experience are numbered in their ranks, and even in England it would be easy to name persons of eminence in art and literature, and some branches of science, who are puzzled by the phenomena they suppose themselves to have witnessed. Thus the late Augustus de Morgan writes, in the preface of 'From Matter to Spirit,' 'I am perfectly convinced, in a manner which should make belief impossible, that I have seen things called spiritual which cannot be taken by a rational being to be capable of explanation by imposture, coincidence, or mistake.'" From the scientific point of view, the claim of the spiritualists must be admitted, or denied, in the light of evidence. Notwithstanding the number of ghost stories that are current in the world, the great majority of men and women will affirm that they have never seen a spirit or communicated with one in any way. On the other hand, many ghost stories are so respectably fathered that it is hardly logical to dismiss them as absurd upon no better ground than a merely negative experience. There are probably very few persons who are not personally acquainted with some one who believes himself to have been visited by a distant friend at the time of that friend's death. It is not sufficient to ask why such ghostly visits should be paid, or why they are still more frequently paid if there is any good reason for them. What we have to meet is the actual evidence, the affirmative testimony of many credible witnesses. The truth is that no solution has yet been offered which is in all respects perfectly satisfactory; but modern science has proposed one which the average educated mind prefers to the literal acceptance of the apparent truth of this class of narratives. We refer to the physiological theory of subjective illusions. It is a well-known fact that an impression once made upon an organ of sense may be revived or reproduced by the reactive power of the imagination, by the association of ideas, or by the will through those agencies. Thinking of sour grapes, for instance, will set the teeth on edge, and thinking of a savory article of food will "make the mouth water." That is to say, will stimulate the ac-

tion of the salivary glands. Now, when an old impression is thus revived with an intensity equal to that of present sensations, it is possible under some circumstances to overlook the fact that it has been produced by a purely subjective process. This equalization of old impressions with new and present sensations may be effected, says Dr. J. W. Draper, the famous physiologist and chemist, in two ways: "1. By diminishing the force of present sensations, as when we are in a reverie, or have fallen asleep, or by breathing vapors unsuited for the support of respiration. 2. By increasing the activity of those parts of the brain in which the old impressions are stored up." Remembering these facts, it is easy to see how a man who is in a state of reverie, or who is nearly asleep, may confuse in his consciousness an old impression, subjectively revived, with the new sensations which are at the same time produced by actually present objects. A man is in his bedroom at night, in a state of listless reverie. Suddenly he sees before him the form of a father, a brother, or some intimate friend. The door is closed and the windows are down, and he is naturally startled; but before he can speak the image disappears. He looks at his clock, and finds that it is just half-past twelve. A few days later he learns by letter, or otherwise, that his friend died, a thousand miles away, precisely at that hour. Of course he thinks that he has seen a ghost. It is of no use to tell him that he has been the victim of a hallucination; for he was not asleep, and he remembers perfectly well all the attendant circumstances. In reality the form of his friend appeared before him as a revived impression, subjectively induced, but with an intensity, a vividness, equal to that of the objects actually in the room. The whole subject is so obscure that it is very difficult, if not impossible, to suggest any theory which can silence all further questioning. Science cannot establish a negative, and human nature has no interest in discrediting stories that would prove, if their truth were indubitable, the fact of a life beyond the grave.

SMOKELESS BATTLES.

HOW ARMY OPERATIONS WILL BE AFFECTED BY THE NEW POWDER.

In the ensemble of battle and in the practice of following its different phases the smoke of the field has been a useful auxiliary to the commander-in-chief. The clouds and puffs floating over the lines of fire, which he followed from his post of observation—usually an elevated one, where the atmosphere remained clear—certified the troops engaged, revealed to his practised eye an estimate of the adversary's forces, and showed him step by step the fluctuations of the battle. In short, they often told him more than the delayed reports of aides de camp. But powder without smoke is now an established fact. Artillery and infantry open fire, and no smoke is visible! A single shot from the skirmish line is henceforth absolutely imperceptible, and a salvo from the line of infantry at 300 yards only produces a thin blue-white vapor like tobacco smoke, that vanishes almost instantly. In no instance, not even in the firing of heavy ordnance, is the vapor dense enough to indicate even at short firing range the position of artillery or infantry. These facts, and others showing the insidious properties of this new agent in modern warfare, were discussed at length at a recent meeting of a military board in this city, when it was decided that the new powder should be tested officially at Springfield with a view to its introduction into theAmerican Army. Of course powder without smoke cannot become the privilege of the American Army. European nations have taken up the problem, and several of them boast of having a formula of their own. Hence advantages and disadvantages attending its use on the field of battle will be common to both sides. Each acquires a better view of his adversary, but loses the protection that a veil of smoke afforded him. *A priori* one can judge how doubly important becomes the advantage of being the first to see the enemy, unseen by him if possible. In spite of all the precautions which may be taken to discard those details in the uniform that might mark too conspicuously the presence of a troop, surprises—and surprises are common occurrences in war—will be much easier to effect than before. The side that first receives the fire will suffer a serious disadvantage, for some time must elapse before it can ascertain whence comes the attack; and the forces belonging to either side, though not two miles away, may know nothing of the skirmish. Owing to the distance that two armies preserve during the preliminaries of a combat, cavalry is intrusted with the honor of getting information—a perilous trust at best, when it is considered that a mounted troop is not easily kept out of sight, and that the chances are against its being the first to discover a well-intended advance post. Moreover, if it is true that in recent wars the increased improvement of quick-firing arms has diminished the efficiency of the cavalry role, its future charge without the protection of smoke to cover its advance is looked upon as problematic. The results of the new powder in what concerns infantry are doubtful, so much depends on the quality of the troops. As long as he is ambushed the infantry soldier will be a myth; firing at 600 yards, his shots will neither be seen nor heard, only felt. But, it is stated by army officers, his role is not to remain stationery. He must advance and show himself. No longer protected by a cloud of smoke, he will have to face a fusillade tenfold more appalling than Antietam or Gettysburg. Then? Artillery, say the veterans, gains everything by operating in a clear field. Before it worked blindfolded; the enemy's smoke served as aim, and it was often deceptive. Now the exact position of the opposed artillery will be visible. With even chances, when once a battery has attained precision in its aim, which before could but imperfectly be determined on account of smoke, it will serve as a guide to neighboring batteries, and thus the fire will be concentrated and more effective. So that the artillery, if not the infantry and cavalry, would seem to be the gainer by the great martial transition from much smoke to no smoke at all.

LATIN IN MODERN SCIENCE.

IMPORTANCE OF ITS STUDY FOR PROFESSIONAL MEN.

The past twenty-five years have seen great changes in systems of higher education. Where formerly colleges and universities furnished only Latin, Greek, and the higher mathematics, now they set forth a bewildering variety of scientific and philosophical courses. One cause for the change lies in the varied practical applications of science which have greatly increased men's comforts or furthered their business interests. Improved machinery, new uses for electricity, and the many economies which chemistry has taught to manufacturers—all these are now recognized in college work as special departments and requiring special study. Then, too, scientific investigations have made such permanent changes in the field of thought other than the directly practical ones, that educated people cannot afford to be ignorant of them. Witness the doctrine of evolution, how it has entered into art, morals and philosophy, not to mention biology, psychology or sociology. But there is still another reason for the distrust felt for an exclusively classical education for nineteenth century boys and girls. It is strongly suspected that four years devoted to Latin and Greek have a tendency to develop rote memory at the expense of the judgment. To live much among dictionaries is apt to engender too great deference to authority to other peoples' opinions. To hear again and again that there is no reason for this conformity, or that irregularity in speech, is to have the usual thirst for causes quenched but left unsatisfied. We ought not to be contented to stamp our opinions with a passive "ipse dixit." But there is not time for ordinary students to make independent researches in language. We must accept what scholars offer us as the result of their delving. Would we develop our powers of judgment—of sifting evidence—we must turn to the natural and physical sciences. Here are vast collections of facts which we can verify by our own observations and experiments. We can learn to group them under laws, by extensive comparison—to distinguish the constant from the accidental, the false from the true. Such study will better prepare us for the complex problems of our daily lives than would the study of Homer or Virgil in the original. But in this reaction against the classics, as in all reactions, there is danger that the pendulum will swing too far the other way. We grant the necessity for scientific training, both for its use as knowledge and its value as mental discipline; but we believe that the study of Latin is as real a necessity for professional men. The scientist cannot afford to be ignorant of this tongue. His technical terms, the tools of his thought, are made of Latin roots, prefixes and suffixes. His staggering botanical names, his geological and zoological ones as well, and terms of his chemistry, physics, and astronomy, spring mainly from the language in which Virgil sung and Cicero spoke. No more can the physician dispense with Latin. The difficulties of his highly technical and elaborate phraseology, which almost constitute a language by itself, are greatly lessened by a thorough comprehension of its Latin foundation. Lawyers, too, and other public speakers should have some acquaintance with this ancient tongue, not only of certain legal phrases which retain their original Roman form, but because of the increased vitality their English vocabulary would possess. Words are pre-eminently the tools of these professional men. Our Latin derivations are so numerous that a knowledge of their ideas greatly furthers their skilful use. This should be kept very prominently before all Latin students. No opportunity should be lost for tracing the root meaning of English words which have a Latin source. One book of Virgil, studied with this end in view, would yield more of lasting practical benefit to the average student than the whole twenty regarded merely as so much literature to be translated, or, worse yet, as only Latin "lessons." Let the derivation of "crucial"—from "crux," a cross—be instantly recalled when the word is mentioned, and how much more vivid to the imagination is a "crucial test!" The significance of an "impediment" is seen when we remember that literally it means "to go against the feet." Bits of interesting history too are bound up in words, as in "pecuniary," whose source, "pecunia," tells us that in early Roman times a man's cattle were his money. "Subjugate" recalls an ancient custom of the Romans who forced their conquered enemies—"sub jugum agere"—to pass under the yoke. Thus might example after example be cited, all illustrating the same idea, that a wisely pursued course in Latin gives flexibility and precision to one's English vocabulary. So closely are medicine and pharmacy united that if the doctor needs to understand Latin, the pharmacist does also. It will enable him much more easily to grasp and retain the terminology of his profession. True, he does not need to study the authors commonly prescribed in Latin courses; they are for the literary men, for they deal with literary subjects. He does not need to know how Cæsar conquered the Germans, or dealt with traitorous allies. Neither need he follow Cicero's reiterated denunciation of Catiline. The Latin for him should be an elementary work whose practical exercises illustrate the principles of Latin grammar in Latin words which refer to drugs, their preparation and their prescription. Instead of rendering into Latin "Virtue is better than gold," he should translate "Quassia is more bitter than gentian." It will be more profitable for him to reflect upon "Medicus malariam quinina, cinchona, et aliis potentissimis remediis pugnat," than upon "Cæsar per exploratores certior factus est, tres jam partes Helvetios id flumen transduxisse."—*Western Druggist.*

FIRE.

SOME CHEMICAL CONSIDERATIONS OF COMBUSTION.

What is fire? We fancy that few persons could answer this question offhand, although the phenomenon of combustion is perfectly familiar to every one. The ancients considered fire to be one of the primitive elements, like the earth, air and water—all of which last we now know to be compound and not elementary substances—and this idea of an elementary fiery principle survived under the names of phlogiston, caloric, etc., down to the time of Lavoisier, and was not entirely overthrown until after the beginning of the present century. We have, in the preceding, spoken of fire as a phenomenon, and that is exactly what it is. Fire is not a substance; it is not even an immaterial force, like light or heat; but, as generally understood, is simply the sensible phenomena of light and heat resulting from an intense chemical reaction—generally, but not always, a process of oxidation. We may dissolve a piece of zinc in sulphuric acid, by itself, or do the same when it forms a pole of a galvanic battery; or we may heat it until it bursts into flame. In all these cases the process is a similar one,—that of oxidation,—but fire accompanies the process only in the last. There the oxidation takes place so rapidly that the heat set free is not only sufficient to be detected by our nerves of sensation, but the resulting particles of zinc oxide are heated to such a degree that they become luminous. So, if finely divided metallic iron is exposed to the air it gradually absorbs oxygen and is converted into rust. But if the same iron is ignited with a match it takes fire, becomes luminous, smoulders away like a glowing coal, and is soon converted into a similar oxide, or rust. Just as much heat is set free in one case as in the other, the only difference being in the rapidity of its development, which determines whether or not it shall become evident to our senses. When hydrogen and oxygen are burned together, as in the oxyhydrogen blow-pipe, the resulting flame, although one of the hottest known to us, is almost invisible, and to the eye alone there is no appearance of fire; but introduce a piece of metal or a lump of lime, or other refractory substance, and the brilliant luminous phenomena at once indicate the intensity of the chemical combination which is taking place. Fire is not always dependent upon a process of oxidation. A mixture of iron filings and flowers of sulphur is readily ignited, forming ferrous sulphide; and sodium, potassium, copper, and some other metals readily burn in the vapor of boiling sulphur, giving rise to the same igneous manifestations as when they combine with oxygen. Nitrous oxide, or laughing-gas (N_2O), also supports combustion, although the reaction is one of true oxidation, the same as with pure oxygen or air. A very important distinction must be drawn between fire and flame; the latter is merely an incidental manifestation of the former. Burning charcoal simply glows and wastes away; there are no combustible gases formed, and the chemical reaction takes place only on the surface of the coals. With wood, oil, wax, tallow, etc., the heat produced by the oxidation sets free from the unconsumed portion a large quantity of hydrocarbon gases, which take fire and burn at a distance from the original burning body, exactly as the gas which we burn in our houses is driven off by heating the coal at the distant gas-works. If we burn a piece of magnesium, flame is apparently present, but it is only the incandescent particles of oxide as they fly off into the air at white heat. A similar artificial flame may be made from charcoal itself by finely pulverizing it, throwing the dust into the air, and igniting it. Serious explosions have occurred by dust igniting in this manner, but such phenomena are not, strictly speaking, true flames, which are only produced by the combustion of gases. A word should be said in reference to electric lights, which are simply masses of carbon heated to an excessively high temperature. There is no true fire or oxidation about them, but a transformation of electrical energy into heat and light. There is an oxidizing process at the foundation, however, and the heat of the oxidizing carbon in the furnaces under the steam boilers which furnish the power to drive the dynamo machines, is just as truly transferred through the wires to the distant electric lights as the water from the pond or stream is transferred through the pipes to the dwellings of the city. In one case it is the transference of energy, in the other that of matter. The knowledge of fire is a distinctive attribute of mankind. No ape, however intelligent, has been found but what regards it with terror, and no race of men—with, perhaps, one or two doubtful exceptions—but what enjoys its numerous benefits. It is hard to say how it was first brought to the knowledge of mankind. The Greeks considered it a direct gift from the gods; but, disregarding that belief, the lightning-stroke, the volcano, an accidental spark, from the striking of a stone, falling upon dry leaves, or even, as has been suggested, by a drop of gum exuding from a tree acting as a natural burning glass,—any or all of these causes may have introduced this useful but dangerous servant to mankind. Once discovered, the knowledge seems to have been carefully preserved, and the art of producing fire has advanced through the fire-sticks and drills of the savage to the flint and steel, and friction matches of later times, until in this modern age of electricity a touch of the finger is sufficient to produce an electric spark which will instantly ignite the fires and gas-lights of the largest building, or, if desired, those of an entire city.—*Pop. Science News.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, geese.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUITS.—Apples, bananas, grapes and oranges.

PRACTICAL RECIPES.

BISQUE OF CLAMS.—Take one dozen large hard shell clams and scald them in their own juice, then chop them up fine. Heat to the boiling point a quart of beef stock and cook in it half a cupful of rice, a bouquet of soup herbs, some pepper and salt. When the rice is thoroughly done add the clams with about half the juice and half a cupful of hot cream. Strain and serve with snippets of toast.

MISS I.'S SCOLLOPED LOBSTER.—Chop the meat of one large boiled lobster. Place in a baking dish, with bread crumbs, in layers, seasoning each layer with salt, pepper and plenty of butter. Add hot water a little at a time until the whole is thoroughly moistened. Sprinkle bread crumbs and bits of butter on top. Bake half an hour in a slow oven.

TOMATO PATTIES.—Line some patty-pans with puff-paste. Scald some fine tomatoes and remove the skins; cut them in halves, put a half in each pan; sprinkle on each some salt, pepper, a little sugar and bits of butter. Cover with paste and bake to a rich brown, then serve at once.

DOUGHNUTS.—One cupful sour cream, one cupful sugar, three eggs, one teaspoonful soda, two teaspoonfuls nutmeg, enough flour to roll out. Fry in boiling fat.

APPLE CAKE.—Make a layer cake as follows: one large tablespoonful butter, one and a half cupful sugar, three eggs, one cupful milk, three tablespoonfuls baking powder, sufficient flour to make a not too thick batter; flavor with grated nutmeg. Bake in four layers.

FILLING.—Grate the rind of half a large fresh lemon and half an orange; add the juice of each (half the lemon and half the orange); grate three large tart apples with the lemon and orange and add to it a well beaten egg. Boil for five minutes, sweeten to taste, and put between the layers of cake.

CANDIED GINGER.—Put two pounds granulated sugar and two cupfuls water over it to boil in a porcelain-lined kettle. Do not stir it, but when a scum rises skim it off; when it is a thick syrup set it aside. Cut into small pieces half a pound of ginger and let it boil in water for an hour, then pour off the water and pour on the ginger enough of the syrup to cover it, and boil for an hour and a half, adding more syrup as it boils away, until the ginger is very tender, then drain it on a sieve, and, when cool, dust it with granulated sugar, then dip it again in the syrup, and, when cool, dust again with sugar.

BERTHA'S CLAM FRITTERS.—Drain the broth from the clams, and then to a cupful of this add the same amount of milk, three eggs, a little salt and pepper, and flour enough for a thin batter. Chop the clams fine, and add last of all. Fry in hot lard.

WOMEN'S WAGES.

A WOMAN SEEKING COMPENSATION FOR SERVICES IN THE WAR.

Dr. Mary Walker has been seriously ill, but at latest advices seems likely to recover. It is to be hoped that her enfeebled condition may plead more powerfully with Congress for the passage of a bill indemnifying her for her services as assistant surgeon during the war than her active efforts have been able to do. Dr. Walker was assistant surgeon in the hospital to which the Patent Office was converted and worked without pay, performing the same duties as the male physicians. She was not regularly in the service until a year before the war closed. Distinguished generals and statesmen at that time complimented the ability which has been lost sight of in the derision to which her peculiar style of dress has subjected her, yet there is no doubt not only her surgeon's skill but her womanly tenderness are enshrined in the heart of many who wore the blue. Some years ago the writer was in conversation with Judge Wesley Tucker, of Nebraska, and Dr. Walker's name was mentioned. The big hearted old soldier fired up with enthusiasm at once and said he would knock any man down who spoke disparagingly of Dr. Mary Walker in his presence. He then described the battle of Peach Tree Creek and how Dr. Walker came dashing up on a horse. He had become acquainted with her when she was a prisoner in Castle Thunder, and he asked her why she was there. She replied, "I'll show you," and jumped off her horse and went in among the falling shot and shell and ministered to the wounded. "I've seen rough, shaggy men cry like children when she'd talked to them," said the judge. After the battle of Rasaca, in Georgia, he saw her again in her tender ministrations. She kissed a boy about sixteen years, old who was wounded with a bullet through his chest. He threw his arms around her neck and clung to her until he died. What a terrible commentary on our civilization and in our boasted free republic that a person can be subjected to such contumely, to the avoidance of women, the contempt of men, and be the object of derision for every street gamin and journalistic fledgling, simply because of the garb. Nobody can say that Dr. Walker has been immodest in her wearing of the masculine dress, for she is a very prude even in her reasons for espousing it; but she has certainly sinned against the sweet graces of womanhood in donning anything so ugly as the male costume after leaving the army, where something like it was indispensable. But this whim of hers should not have obliterated all remembrance of how she had been one of the earliest and strongest friends to push for women, and of all her loyal service to her country.—*Woman's Tribune.*

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

BUFFALO LITHIA WATER.

There has been so much printed about the celebrated Buffalo Lithia Springs water from Virginia that the medical profession, as well as the public, are fully aware of the medicinal value of this spring water. When professional men of the standing of Dr. J. H. Clairborne, of Petersburgh, Va.; Dr. Landon B. Edwards, of Richmond; Dr. G. H. Boyland, of Baltimore; Dr. Wm. C. Wile, of Danbury, Conn.; Dr. J. B. Jones, of Charlotte, N. C.; Dr. Jno. C. Coleman, U. S. N.; Dr. Thomas P. Atkinson, of Richmond; Dr. Wm. Harrington, of Hot Springs, Ark.; Dr. Cyrus Edson, of New York; Dr. Allard Memminger, of the University of South Carolina; Dr. J. S. Wellford, of Richmond; Dr. Martin L. James, of Richmond; Dr. Harvey L. Byrd, of Baltimore, and many more positively state that they have used Buffalo Lithia Water with beneficial and curative effect in their practice in stone in the bladder, gout, rheumatism, and all diseases dependent upon a uric acid diathesis, it is useless to add one word to prove what Buffalo Lithia Spring water is, and what it can do. We have thought it best, therefore, to depart from the beaten track, and will try to give some additional information on the subject of mineral waters in general and lithia water in particular.

Mineral spring waters are so designated when the water contains a larger amount of minerals, either in solution or of a gaseous nature, than the ordinary drinking water, and are employed on account of these constituents for their curative influence in all diseases human flesh is heir to. All alkaline mineral waters act beneficently on the mucous membranes, the glandular and lymphatic systems, the kidneys, and skin, and regulate the secretion of mucus. They counteract the formation of stone and are antacid in their action; they increase the secretion of urine, and are therefore employed in gout, chronic skin eruptions, indurated glands, chronic catarrh and nervous diseases. When to these qualities is added the specific effect of lithium, one of the best solvents of uric acid known, the waters indeed become

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is

THE STRONGEST

of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

25 CTS. PISO'S CURE FOR CURES WHERE ALL ELSE FAILS. Best Cough Syrup. Tastes good. Use in time. Sold by druggists. CONSUMPTION 25 CTS.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.

Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

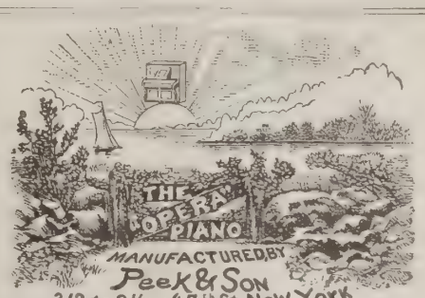
valuable. Lithium is one of the rarer metallic elements, intermediate in its character between sodium and barium, and was discovered in 1817 by Arvedson in the course of an analysis of petalite in Berzelius' laboratory. He recognized the presence in this mineral of a new kind of alkali, which his master subsequently named lithia to denote its mineral origin. Lithia is widely disseminated throughout the mineral world, traces of it being found in almost all alkaliferous silicates, in the soils derived from these, and in many mineral waters, nowhere occurs in any abundance except in the immense masses of lithia-mica (lepidolite), known to exist in Bohemia. The extraction of pure lithia from lepidolite in any form is difficult. Of course chemically pure lithia can be obtained. Carbonate of lithia dissolves in pure water, one litre taking up 12 grammes and if the water is kept saturated with carbonic acid gas it will dissolve 52 5 grammes. This fact may serve to explain the apparently large quantities of lithia found in one so-called natural lithia water, "carbonated." *Metallic lithium*, although long before known to exist, was successfully prepared for the first time in 1855 by Bunsen. Lithium is a silver-white metal of only .58 specific gravity (it floats on rock oil), somewhat softer than lead, and, like it, susceptible of being pressed into wire. It tarnishes in air. The metal melts at 180° C, and at a somewhat higher temperature takes fire and burns into oxide with a brilliant white flame. Lithia-salt solutions behave to general reagents pretty much like those of potash and soda, from which, however, they differ in a few points. Lithia, when used medicinally, is employed either in the form of the carbonate, bromide or citrate when natural lithia water, which is always to be preferred, cannot be obtained. The carbonate of lithia is a white, light powder, looking very much like magnesia, has no odor and a decided alkaline taste. It is almost insoluble in alcohol, but dissolves readily in 130 to 140 parts of water. With acids it effervesces. As found in the stores it is generally a sesquicarbonate, and soluble in 100 parts of water, while the chemically pure monocarbonate requires 100 parts of cold water to dissolve it. The carbonate of lithia, of all alkalis, possesses the greatest solvent powers for uric acid. Professor Binswanger states that 25 parts by weight of lithic carbonate will dissolve 90 parts by weight of uric acid. It is, therefore, considered an effective medicine in gout and uric acid diathesis, especially in uric acid concretions in the bladder and kidneys. In many cases this peculiar property is not only employed internally, but also by injection, and with marked benefit. Several prominent practitioners in Europe report marked success from the use of lithia water as a gargle in dissolving diphtheritic and croupy membranes.

Lithium Bromide is another of the later pharmaceutical preparations of lithia which, in addition to its employment in those diseases where the bromides are indicated, has been used with great success in solving uric acid concretions and deposits and has been found specially efficacious in lithiasis and gout.

Lithium Citricum is made by the addition of citric acid and makes an effervescent lithia solution.

Lithium has been discovered in various springs in Europe, notably that at Baden-Baden. A new bath has been established at Assmannshausen, on the Rhine, in consequence of the discovery there of a weak alkaline spring containing lithia.

One of the striking facts about springs containing lithia is that such springs are only found where the geological formation of the ground shows the presence of lepidolite. Mecklenburg County, Virginia, where the Buffalo Lithia Springs are situated, possesses this peculiar formation to a remarkable degree.



Enough has been said to show that lithia is a most valuable remedy, that the Buffalo Lithia Springs water contains it in a natural state, and in sufficiently large quantities to make this one of the most valuable medicinal spring waters. The medical profession unanimously acknowledge this, and the use of these waters has been increasing from year to year, until now they have attained a sale far beyond the most sanguine expectation of its proprietor, Colonel Goode, who richly deserves his success for his enterprise and push in making the virtues of the Buffalo Lithia Spring water known and bringing it to the notice of the profession.

"THE GREATEST THING IN THE WORLD."

Prof. Drummond's famous address on "Love: the Supreme Gift," sometimes called "The Greatest Thing in the World," which has had a wonderfully large sale at 35 cents a copy, and has undoubtedly done a great deal of good, is now published by Alden, unabridged, in large Pica type, for *three cents!* It ought, now, to circulate by the million. The same publisher issues Drummond's "Natural Law in the Spiritual World," in large type, fine "half-seal" binding, for 35 cents, plus postage, 10 cents. These are two items characteristic of the 132-page Catalogue, which is sent free on request, by the publisher, JOHN B. ALDEN, 393 Pearl Street, New York.

RHEUMATISM.

We asked an old physician the other day, "What is rheumatism?" His answer is worth printing, because he does not assume to know it all and yet gives a great deal of practical common sense information. "Probably no disease has been studied more, experimented upon more, theorized upon more than rheumatism, and certainly no disease is understood less by physicians and patients. An absolute cure for it, applicable and effective in all cases, is not known, even in these days of salicylates, much better than when two hundred years ago it was treated with earth-worms, snake oil and frogs' eyes. However, some advance has been made, and although physicians cannot always cure, they can often alleviate the pain or prevent the attack. Rheumatism may be acute or chronic. It is unquestionably a constitutional disease, and although it is liable to run into complications, it shows itself most plainly in painful and generally inflamed conditions of the joints. Acute rheumatism is hereditary in about one-quarter of the cases, and is the phase of the disease which affects the young and middle-aged. It is always attended with more or less fever, and an attack of it is usually commenced with chilliness and shuddering, known as 'rigors.' Prevention is the great thing Exposure to variable weather is a prolific cause, and a thorough wetting on a cold, raw day is almost certain to result in a more or less severe attack of the disease. Excessive fatigue, a depressed condition, over-work, anxiety, or any long-continued drain upon the system may bring about rheumatism. Climate has a great deal to do with it too, as a much larger proportion of cases exist in cold, damp regions. I cannot too strongly advise the greatest diligence in the matter of drainage, warmth and dryness in our dwelling-houses, and I want to condemn with all possible emphasis the custom of sleeping in rooms immediately over the cellar; or, what is worse and not at all uncommon in country houses, sleeping in rooms on the ground floor without any cellar under them. The climate is changeable enough, especially on the Atlantic slope, to justify me in advising every one to wear wool under-clothing; not necessarily thick garments, but of wool. It need not be red nor 'pure cochineal dyed' nor 'medicated' but let it be wool—all wool. So much for prevention; but if you are so unfortunate as to be attacked with the disease, let me give you the most successful treatment. The attack comes on with fever, swollen painful joints—perhaps one, perhaps three, or all, or any number, but generally the knees, hips and elbows; the patient is restless but afraid to move—often the very pressure of the bed-cloths causes agony; frequently there is profuse perspiration. The pain often goes from one joint to another without any apparent cause. The patient should lie between woollen blankets, and should move as little as possible, especially the affected joints, bathe the parts with warm water containing about a tablespoonful of laudanum to each quart of water. Another excellent lotion is a strong solution of carbonate of soda (sal soda) to which has been added a few drops of oil of wintergreen. The wintergreen is not used because of its perfume, but because it is peculiarly rich in salicin a comparatively new drug, which is especially valuable in rheumatism. The remedies for internal use are innumerable, but where a patient prefers to treat himself, I know of no better remedy, or one which combines so much in one, than Ayer's Sarsaparilla, as put up by Dr. J. C. Ayer & Co. of Lowell, Mass. I have long since made up my mind that many people prefer to use proprietary medicines and therefore I advise them to use the best. All of the remedies prepared by J. C Ayer Co are put up on regular approved physicians prescriptions, from the best drugs, in a conscientious manner; and I know from experience that they are always reliable."

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Feb. 2, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Prime Hay	60c @	60c @
No. 1	55 @ 60	55 @
No. 2	50 @ 55	50 @
No. 3	45 @	45 @
Shipping	45 @	45 @
Clover mixed	45 @ 50	45 @ 50
Clover	40 @ 45	40 @ 45
Prime Rye Straw	85 @ 90	45 @ 55
No. 2 "	80 @ 85	
Short "	60 @	
Oat and Wheat	50 @	

Receipts week ending Jan. 31, as follows:

Via N. Y. Central	268 cars.
" West Shore	161 "
Other roads by Lighter, 34th Street	75 "
Total	504 cars.
Total last week	344 "
Increase	160 "

For the past week the hay market has been fairly active, but prices have ruled quite as low as any time this season, as will be seen by the above quotations. Shipping hay is in better demand and brings more satisfactory prices than any other grade.

This week we quote both large and small bales, for shippers of small baled hay have thought the quotation of No. 1 and No. 2 misleading, as it has been impossible to realize quotation prices on these grades for the past month.

The stock of rye straw is accumulating. Market consequently weak.

GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens,** in **Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

"BILLET"

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

ADDRESS:

THE ANALYST PUBLISHING CO.
No. 19 PARK PLACE,
NEW YORK.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

PROF. KOCH SEEKS REST.

After several months of incessant labor, Prof. Koch has been compelled to abandon for a time his laboratory labors, and he is seeking rest and recuperation in Egypt. The professor will probably be absent from Berlin about three months. He explains that he only partially disclosed the method of the production of the curative lymph because he desired to stop the rush of doctors to Berlin. If he had described the method of manufacture more fully, he would have been more worried about the details. Great discontent prevails among medical men regarding the published account of the method of manufacture of the lymph. They have made numberless attempts to produce the lymph, but they find Prof. Koch's description totally inadequate to enable them to make it. Meanwhile, our American scientists are prosecuting independent researches on the line indicated by the German doctor. A despatch from Ann Arbor, Mich., of February 1st, announced that enough of the Koch lymph has been received at the university to make 1,000 injections, and experiments will be made with it at once. Prof. Vaughan recently made an announcement which caused much excitement among the medical fraternity, to the effect that he has discovered germs which were the causes of the diseases of typhoid fever and cholera infantum. Now he says if the Koch remedy proves a success he will be able to cure the above-named diseases in the same way as he had manufactured a typhoid fever lymph—upon the same principle that Koch makes his consumption lymph. He has already experimented with the new lymph upon small animals, and is only waiting before trying it upon persons until he can ascertain the action of the Koch lymph.

COOKING AND EATING.

The man or woman who lives in New York and is content with inferior food is unworthy of the privileges of civilization, for no other city in the world is better supplied—hardly one is as well supplied with the best of every viand known on earth, and the very volume of the traffic serves to keep prices down within the reach even of the poor. It is possible to live daintily and well on little money, and no subject in common life so well repays study and care, as the supplying of the table, yet it is a subject which for some reason seems to receive far less attention than it deserves. Whether from indolence, preoccupation, or a feeling of ill-defined shame, men, as a rule, understand little about the selection of food and still less about its preparation or cooking. They leave the matter to their wives or servants almost entirely, and even fail to appreciate the relation of cause and effect when poor, or poorly cooked food has made them ill. This is not as it should be. Wholesome epicureanism is not only one of the principal means of pleasure in this world, but it is a direct cause of good health and consequent happiness. Doubtless, if we consider the saying sufficiently to appreciate the subtlety of it, it is better to "eat to live" than to "live to eat," but if it be understood simply to mean that food should be shovelled in like fuel, and that the enjoyment of eating is an unworthy pleasure, the proposition should be reversed. Yet many otherwise intelligent people look upon epicures with contempt, and pride themselves on their indifference to the pleasures of the table. It has been pointed out many times that the whole art of cookery is the outgrowth of experiment and experience for many centuries. Combinations—and the greater part of our food consists of compounds—are the results of study and careful experiment, or in rare cases, as Charles Lamb fancifully imagines about roast pork, are due to remembered accidents. Moreover, the range of possibility in forming compounds is so nearly infinite, that progress is made constantly even now after generations of geniuses have passed away, leaving us the results of their work for a rich legacy. Think of the difference in skill and intelligence between the barbarous combination of pork and molasses and the artistically compounded chicken salad! The proof that progress is still made, lies all around us. It is only a few years ago that a man was counted foolhardy who would eat a hearty meal just before going to bed, and the fact that he did not die, or at least get sick after such a performance, was attributed to his natural strength. Lately it occurred to the medical fraternity, who had kept this superstition alive for many generations, that dogs and babies were wiser than they, being taught by natural instinct alone, and now they tell their patients to eat whenever they are hungry, and never to quit the table with the appetite unappeased. Progress in another line has come from the combinations of different schools of cookery. The English, French, German, Spanish, Italian and Chinese schools are all different and distinctive, and not very long ago a native of any of these countries would actually have suffered for lack of food if transferred to any other country. He might easily have gotten food enough, but it would not have been what he wanted. The effect of modern travel, however, has been to modify all schools, excepting, probably, the Chinese, and all have been thereby improved. The cooks of all nations have learned from others, and probably the very best cooking in the world is to-day done by good American cooks, for they have learned from all.

INTEMPERANCE IN GERMANY.

There is a popular impression that on account of Germany being a wine producing country its people are but little addicted to intemperance. Among the upper and middle classes—precisely those who are able to indulge their thirst with their native wine—that proposition is generally correct; but among the lower orders, who are constrained to gratify their drinking propensities with distillations of potatoes, cheap "branntwein," low grade "schnapps," and other stomach-corroding abominations, drunkenness is but too common. The vice has lately grown to such sinister proportions that the government has at length interposed to check it. It is expected that a general law for the suppression of drunkenness will be enacted and put in force in all the States of the German Confederation before the year is ended. A bill on the subject has been prepared by the Prussian Government and has received the approval of the Emperor, who, from the day he succeeded to the throne, has persistently demanded some restrictions upon the sale of intoxicating liquors. For nearly three years his Ministers have been engaged in collecting statistics and evidence on the points concerned, and the decisions at last arrived at have already been sanctioned by the Bundesrath. The bill decrees the withdrawal of saloon licenses and the imposition of fines upon saloon keepers who encourage persons of inebriate habits. The drunkards themselves will be fined if they

are poor, so as to prevent them from indulging in the vice of intemperance, and terms of imprisonment are to be imposed in cases where a monetary fine would presumably not have the desired effect.

MODERN SURGERY.

WONDERFUL ADVANCE OF THE SCIENCE IN THE PAST FIFTY YEARS.

The practice of surgery has always been more or less of a science. Even in the earliest times very serious surgical operations were undertaken with success, and some of them are now often wrongly proclaimed as modern in their origin. Ovariotomy was practised by the ancient Hindoos. An example of prehistoric trephining may be seen in a skull from Peru at the Museum of Natural History in this city. The morbid conditions which the surgeon has to combat are tangible and objective, so that his chief difficulties have been in the way of skilful manipulation of instruments, the management of blood vessels, and the proper cleansing of wounds. But there are striking features in the surgical science of the past fifty years which mark epochs in its advance, and of which the surgeons of other centuries could scarcely have dreamed. The first of these was the introduction of anæsthesia from chloroform and ether, making it possible for patients to undergo operations the very pain of which might under former conditions have caused their death. This has enabled the surgeon to prolong his procedure for hours, if necessary, instead of limiting himself to the hurried seconds and minutes which must have seemed an age to the tortured and conscious sufferer. We are now so accustomed to hear of the use of anæsthetics in all operations that it hardly seems conceivable that so few years have elapsed since they were first employed. Another revolution was accomplished by a discovery which has affected both surgery and medicine alike, and that is the parasitic origin of diseases. When it was learned that air and dust and water were everywhere filled with countless millions of invisible germs, and that some species of these, by being inhaled or swallowed, entered and poisoned the blood, producing contagious and infectious fevers; that some were the cause of fermentation, and that putrefaction was absolutely impossible without their presence, it did not take long for the surgeon to investigate their relation to the wounds which he was obliged to make, and through which these bacteria might readily find entrance into the system. Never before had he understood why erysipelas sometimes appeared in a wound; why blood poisoning would follow some of his operations; why some of his wounds would heal at once by first intention, while others would suppurate for weeks or show no tendency to heal; why tetanus or lockjaw was to be expected as an occasional complication; why hospital gangrene would haunt his wards like a dread phantom that could not be dislodged. How many thousands of lives have been sacrificed through such ignorance? One need but to glance through some medical history, such as that of the War of the Rebellion, to learn what havoc and devastation these invisible and unknown enemies made. Sabres, bullets, and cannonballs were trifles compared with them. More than three times as many soldiers fell victims to these impalpable foes during the war as were killed in battle. Fully one-sixth as many as were slain on the field died from surgical germ diseases alone, from the infection of their wounds by the myriads of the air. Now the surgeon knows that no atmosphere, whether that of mountain or sea, is absolutely free from putrefactive germs, and that the air of hospital wards and sick-rooms is particularly loaded with organic matter of all kinds, and with microbes in abundance. From these well-established facts has arisen what is known as the antiseptic treatment of wounds. Substances have been found which kill these germs, among the first and best of them carbolic acid; and now we have numberless germ-destroying agents. The modern surgeon gets rid of every microbe upon the surface of the part before operating, by shaving and thoroughly washing the skin with antiseptic solutions; every instrument, sponge, suture, and ligature is treated or saturated with them; his own hands and those of his assistants must go through a similar process of disinfection; the operating room is made as germ-proof as possible by causing each nook and corner and wall to be of such material and shape that they may be scrubbed down frequently with bactericides; often a spray of antiseptic vapor is played into the air above the wound during the operation; the towels, bandages, and dressings of cotton, lint, and gauze are all made similarly safe. Should he meet with the old and too familiar symptoms, the surgeon knows there must have been some flaw in the preparations. The bacteria still occasionally outwit him; but the contrast between the results of to-day and those of yesterday is marvellous. Aseptic surgery is of such recent origin, however, that there are still many surgeons, generally older men, and in the provincial districts, who either have no knowledge of the scientific facts, or who, bound fast by hereditary prejudices, profess to disbelieve in their truth, and continue to immolate fresh victims year after year upon the altar of their own ignorance. As regards operative procedures themselves, anæsthetics, antiseptics, improved methods of checking hemorrhage, and a variety of new instruments have made it possible, not only to undertake new operations and perfect old ones, but also to practise conservatism in surgery. Thus amputations are by no means so common as formerly, for limbs are preserved by different operative methods under these new conditions which before it was considered impossible to save. If there is anything, however, which serves to distinguish the surgery of this time from that of the past it is its visceral character. Then the operator busied himself chiefly with externals: outer tumors, the skin, limbs, and the like. Now his most brilliant work is among the organs contained in the cavities of the abdomen, chest, and head. No organ is beyond the reach of his knife. Pelvic organs are extirpated; large abdominal tumors, and such organs as the spleen, the kidney, and the larynx, are often successfully removed. Injuries to the intestines and the stomach are no longer considered as necessarily fatal, for they may be sewed up, parts cut out; and the ends approximated, very much like rubber hose. They are beginning to cut tubercles out of the lungs, and tumors are removed from regions in most dangerous proximity to the heart, the large blood vessels, and the great nerves. But most remarkable of all is the very recently developed surgery of the brain and spinal cord. This new departure is wholly owing to the wonderful advance made in the knowledge of the anatomy and physiology of the central nervous system. The surgeon depends upon the nerve specialist to localize the morbid process in the brain or spinal cord, and to determine the nature of the disorder, whether hemorrhage, tumor, abscess, or whatever it may be. It is a dangerous region, but the results are sufficiently successful to warrant operations where death is imminent without them. Quite lately operations have been carried out upon the brain itself in peculiar forms of insanity, and in cases of idiocy where the growth of the brain seems to be hampered by too early union of the bones of the skull. In the latter case the design is to remove sufficient bone to allow the brain to grow. As in every novel project or enterprise, time is necessary before judgment can be passed upon the experiment, so in these operations for insanity and idiocy their actual value cannot be determined for at least ten years from their performance. It is doubtful if much more can be done to perfect surgery as a science. Methods and technique may be improved, but there seems to be little territory left to explore. There is one direction, perhaps, in which further achievement is possible. As is well known, the surgeon usually takes away what is diseased or defective. The progress should be in the way of substitution. The transplantation of skin, hair, bone, and teeth, and the transfer of blood from one to another have been accomplished. We must now demand of him new eyes, new limbs, new internal organs, new hearts, and new brains in the place of those which have become so disordered as to require his supervision and manipulation.—*Sun.*

SLEEP.

WHAT OCCURS DURING ONE-THIRD OF OUR LIVES.

The condition in which we pass at least one-third of our lives is certainly one of the highest importance and interest, and it is, even with our present knowledge, not devoid of a certain amount of mystery. We know that in sleep the amount of blood circulating in the brain is considerably diminished, and it is undoubtedly the time when the waste of the nervous system is repaired, and a store of vital force—whatever that may be—laid up for the labors of the ensuing day. The profound influence which the state of slumber has upon the human system is evident to any one who has ever passed one or more nights without the presence of "tired Nature's sweet restorer;" and the feeling of strength, vigor, and well-being with which one awakens after a period of sound, dreamless sleep, shows that the restorative influence extends to every part of the body. The need of sleep is an imperative one, and, in many cases, is almost irresistible. Instance are on record of soldiers sleeping on horseback, or even in the midst of a battle, and many a sentry has been sentenced to death for sleeping at his post, who was in no way to blame for his neglect of duty, but was simply overcome by a demand of Nature which he was unable to resist, even at the peril of his life. Similar instances are known of railroad engineers and steamboat pilots sleeping when on duty, with the knowledge that the lives of many others, as well as their own, depended upon their wakefulness. The proper amount of sleep required by any one is an individual peculiarity, and no general rule can be given. The new-born infant sleeps nearly all the time, but the periods of wakefulness soon grow longer, through childhood and youth, until the full-grown adult devotes a minimum time to the recuperation of his bodily energies, while in old age the need of more time for sleep is again felt. The feelings are the best guide in this respect, and if one awakes completely refreshed after six hours of slumber, that amount is doubtless sufficient for his bodily needs, while another person may require nine or ten hours of each day to restore the balance of vital profit and loss. Nothing, however, can be worse than to regularly deprive one's self of needed sleep, in order to have more time for work or pleasure. This is like expending one's capital instead of the interest, and although the final result may be postponed, it can only end in physiological bankruptcy. The time of sleep is of no particular consequence, and is largely a matter of habit. The darkness and quiet of night naturally lead to repose, but large numbers of people must, necessarily, reverse the usual practice and devote the daylight hours to slumber. Neither is their any particular hygienic virtue in early rising. The familiar old couplet is only true in a very general sense, and there are a great many cases where a man would be healthier, wealthier, and wiser if he delayed the time of his rising to an hour consistent with his own feelings and inclinations. Dreams, undoubtedly, occur during disturbed sleep, or during the interval between sleeping and walking, and—although it is not easy to prove this—it is more than probable that a sound sleep is a dreamless one. Unusual mental anxiety or excitement, or a distributed state of the bodily organs, such as an overloaded stomach, may cause a certain activity of the mental processes, which will become manifest in dreams. The sudden awakening of a sleeper will often cause a dream in the brief interval before full consciousness is attained. Dreams more often relate to recent

and important occurrences in our daily life; but, on the contrary, the most trival incident, forgotten for many years, may be, as it were, stored up somewhere in the brain, to be afterwards revived in a dream, with all the accompanying circumstances. The literature and curiosities of sleep and dreams is, however, very extensive, and it would be impossible to refer to even a fractional part of the observed phenomena. A simple falling asleep, if it were not so common, would be a most wonderful and even an alarming occurrence. Although the vital processes of a sleeper go on as usual, yet the mental life, the self-consciousness is suspended, and the sleeper is practically dead to this world, or else wandering in another and stranger world—that of dream-land. A dreamer may be said to be in two places at once, and if, from any cause, he should not awake, but continue to dream on indefinitely, it would be hard to say why he would not be living just as true and real a life as the one which he knew in his waking hours. Hamlet's chief argument against suicide was that "In that sleep of death who knows what dreams may come?" and Bryant, in his poem Thanatopsis, speaks of welcoming the approach of death,

"Like one that wraps the drapery of his couch
About him, and lies down to pleasant dreams."

It is a noble, and perhaps the most logical conception we can form of the great and inevitable change that must come to us all, to consider it as but the awakening from the dream of our present life into a higher state of existence, with a comprehension of the laws governing the universe and our individual being, which shall lead us to look back upon the experiences of our present life as we now vaguely remember the visions of a disturbed slumber, and with as little regret that they have forever passed away.—*Popular Science News.*

WHOLESOME EXERCISE.

HOW PHYSICAL EXERCISE MAY PROMOTE HEALTH AND BEAUTY.

Few theories are carried to a more unwarranted extreme than that of the importance of physical exercise and muscular development. Because exercise improves health, and muscle is a fine thing to own, half-educated reformers preach exercise and muscle as if there could not be enough of them. Any plain-spoken physician will say at once that there can be too much exercise, and that unwise forms of exercise can be injurious. He will also say that there is very slight essential connection between muscle and that supreme physical quality, vitality. Many a man has developed muscle at the expense of vitality, and many a nervous temperament has impaired health by dragging itself through exercise when it needed rest. Muscle is all right in its proper place, but ahead of it come heart, lungs, brain, and stomach. Cultivating muscle does more for beauty, probably, than for health; and since beauty is really one of the proper objects of effort, the forms of exercise which bestow most symmetry of outline and grace of movement are to be studied. One of the women writers who deal out instruction to the sex has recently advocated running. She is nearer the right track than most of the didactic writers of her kind. Running is the great beautifier of figure and movement. Running gives muscular development, strong heart action, and free lung play. The muscle comes where it ought to be, the shoulders go back, the loins hold the trunk well balanced, and the feet take their correct positions. It was running which made the Greek figures. The more active tribes of American Indians have been runners from time immemorial, and from the chest to the heels they are much more beautifully built than the average of white men. Running people have usually the firm but elastic texture of flesh which is the beauty of flesh. We know infinitely more about taking care of the human body than Greeks or Indians, and if we would train our children to regular and wisely supervised running exercise, supplemented with other exercises for the hands, arms, and shoulders, we could surpass them in beauty and activity. A general adoption of such a system seems very far from likely, since we have none of the appropriate grounds or apparatus. The next best thing is walking, but most of us walk on our heels, and lift up the feet instead of springing forward with them and driving the body on with the back muscles of the legs. Fashionable people will pay high prices for grooms and riding-masters to go out and teach correct horseback movements, but whoever saw a man, woman, or child with an instructor in walking? Yet horseback riding is a trifle beside good walking in its effect either on health or on those qualities of figure and carriage which the whole world holds in high estimation. Gymnasium exercise is so easily overdone, and may be so injurious in some cases, that it is doubtful whether anybody should go in for the gymnasium strongly without the superintendence of a skilled physician in at least the early stages.

METROPOLITAN MILLIONAIRES.

MEN WHOSE FORTUNES ARE UNSUSPECTED UNTIL THEY DIE.

A writer in the *Boston Transcript* says about New York millionaires that in this metropolis "it is a matter of almost daily occurrence to read in the papers the obituary of some man heretofore unknown who has died and left millions of dollars to be fought over by dissatisfied heirs. The case of the late Daniel B. Fayerweather is one in point. Here was a man whom every one who knew him at all supposed to be well off, but not even his closest business associates believed him to be the possessor of such a fortune as his will proved to be his. Two millions of dollars in legacies to educational institutions—why, no one would expect a Vanderbilt to do that. But now up steps his widow and objects to the power given the executors and to the comparatively small amount that falls to her share. It seems to me that there ought to be some way of making a will so that there is no peg in it to hang a contest on. The late August Belmont provided for such a contingency by saying in his will "contestants will be disinherited." But then Mr. Belmont left an admirable will, one that no one would want to contest, his widow much less than any one else. Mr. Fayerweather it would seem leaves his will open to the same construction that has given so much trouble in the Tilden will—undue power to the executors. With the Tilden warning before him you would not expect a shrewed man of business to fall into the same error. Whether it is an error or not the law will have to prove, for Mrs. Fayerweather is going into the contest with all her might and main. There are plenty of Fayerweathers in New York. Take the residence portion of this city and look at the uncountable number of houses that can only be lived up to by the expenditure of from thirty to a hundred thousand dollars a year, and yet how few people know anything about the occupants. They come and go, make and spend, some, of course, die and leave nothing behind them, while others die and leave millions. Aside from the millionaires there must be an enormous wealthy class in this city. Look at the thousands of houses that rent from $2,500 to $10,000 a year. The question of rent is the most serious one with the bread-winner in this city. It is a mighty poor place that can be had here for $1,000 a year—never a house but a cramped and confined flat, with an electric apparatus to open the front door instead of a boy in buttons. I have seen houses that rent for $2,000 that I wouldn't live in, for they are only used for renting and are out of repair, and so plumbed that the tenants who had any regard for their health had the pipes cut off that came beyond the first story. I have seen flats on the Parc Monceau, one of the most fashionable and attractive parks of Paris, that rented for $400 a year, and I know of beautiful flats in London, with an up and down stairs, and facing Hyde Park, the most fashionable quarter of the city, that rent for $600. Once in a while one can strike a bargain in New York, if one wants to buy a house and the one who owns it wants to sell very badly, but that is the only way I can see for the poor and proud to get a decent home in the metropolis of the United States of America. The only remedy for the evil that I can suggest is for the whole of Manhattan Island, "that tongue of land," as Dr. Holmes felicitously expresses it, "that licks up the cream of the commerce of two continents," to be given over entirely to trade and let the dwelling part of the town be beyond the Harlem River, where there is plenty of room for spreading, and streets could be laid out with alleys in the rear, so that the ash-can and garbage barrel need no longer be the trade-mark of New York. All the bridges in the world will not serve the purpose. Our rivers are too wide and the bridges so high that they of necessity must be too long for ordinary crossing. In Paris one crosses the bridges that span the Seine without noticing that they are bridges, for he steps upon them from the level of the streets, and they are crossed in the twinkling of an eye.

ROUGH ON CORNS.—A German inventor proposes to make boots with stone soles. He mixes with a waterproof glue a suitable quantity of clean quartz sand, which is spread on the thin leather sole employed as a foundation. These quartz soles are said to be flexible and almost indestructible, while they enable the wearer to walk safely over slippery roads.

SINGULAR TEXTILES.—It has been discovered that glass is capable of being turned into fine cloth, which can be worn without the slightest discomfiture next to the skin. Cloth is now made of wood. Strips of fine grained timber are crushed between rollers, the filaments carded in the usual manner with textiles into parallel lines and spun into thread, from which the cloth is woven.

HE KNEW BETTER.—"Remember, boys" said the new teacher, who, being still new at the business, knew not what else to say to make an impression, "that in the bright lexicon of youth there's no such word as fail." After that he paused to observe the effect of the chestnut. After a few moments of very deep silence a red-headed boy from Boston raised his hand. "Well, what is it, Socrates?" asked the teacher. "I was merely going to suggest," replied the youngster, as he cleansed his spectacles with his handkerchief, "that if such is the case it would be advisable to write to the publishers of that lexicon and call their attention to the omission."

IMPORTANT WARNING.—Dr. William A. Hammond warns against overheated apartments. He says: "An overheated apartment always enervates its occupants. It is no uncommon thing to find rooms heated in winter by an underground furnace up to 90 deg. Fights and murders are more numerous in hot than cold weather, and the artificially heated air that rushes into our rooms, deprived as it is of its natural moisture by the baking it has undergone, is even more productive of vicious passions. It is no surprising circumstance, therefore, to find a woman who swelters all day in such a temperature, and adds to it at night by superfluous bed clothing, cross and disagreeable from little everyday troubles that would scarcely ruffle her temper if she kept her rooms at 65 deg., and opened her windows now and then."

ELECTRIFIED MILK.—The souring of milk in thunder storms has just received a scientific explanation at the hands of an Italian savant, Professor Tolomei. He has found that the passage of an electric current directly through milk, so far from souring it, actually keeps it sweet, so that it does not turn until the sixth to the ninth day; when, however, an electric current is passed over the surface of milk it soon becomes sour, and this the Professor attributes to the generation of ozone, since the souring is more rapid when the current passes silently than when it is discharged explosively. more ozone being generated by the former than by the latter method. The fact that the souring of milk can be retarded by so simple a procedure as the passage of an electric current may prove of practical value and offers a safer way of preserving milk than by the use of antiseptics.

MENU CARDS.

THEIR USE SUPERFLUOUS AT PRIVATE DINNER PARTIES.

The charm of a private dinner is simply that it is private. Why, then, allow its charm and sacredness to be destroyed by anything so obviously brought into existence by the people and for the people as the menu? A menu is a "bill of fare." The use of the French word is an affectation ; that language, however, lends itself to the cause of cooks as well as it does to that of courts. When the foreign word appears at the top of the card in place of the English one, the affectation continues through the list. Soup is *bouillon, consommé, purée, potage.* A common stew is *ragout.* One from meat or game or fish, already cooked, is *salmi.* Side dishes are *entrées.* A pie is *vol-au-vent* or *paté.* Besides, dishes are *à la* this or that, according to their preparation and ingredients. Thus are our dishes disguised. In adopting the masquerade we pay tribute to French cooking, which is at once the most delicate and economical, but we enlighten only a few in the fundamentals of gastronomy. The menu, then, is only the list of dishes to be served at any one meal ; its object is manifold—primarily it suggests, allows a choice, and expedites the business of feeding. It is of use when one pays; price can control one's choice and one's portion, hence the necessity for a variety being furnished by a servant of the public. It is in its place on a steamboat, at a hotel, in the restaurant or eating-house, and there it should remain. Its motto should be "Pro bono publico." For none of the reasons given, nor for any that can be imagined, should it be allowed to show its brazen face amid the flowers, cut glass, and silver of a home dinner. In using the menu the private dinner is reduced to the unflattering level of a free-lunch counter; whatever is on the list of both is given away to guests. It is acknowledged in æsthetics that the usefulness of a thing is the beginning of its beauty. As a menu serves no purpose at a private table, it cannot be regarded as a thing of beauty if found there. At a public table it is a guarantee of sufficiency and proficiency; no such occult demonstration need be given by the hostess in her own house. Her object is not a gorge, but a seasonable and reasonable repast. With the assistance of the cook she will give the best that the season and her purse affords, and the unlimited power of both does not justify her in allowing her table to groan with quantity, nor the guests to groan at the length of time required to serve it. What guest would have the courage to read over the menu under the smiling eye at the end of the table? Should one be so lacking in this first principle of etiquette, would he have the audacity to benefit by it—decline one course to eat subsequently double an amount of another? Or, should he read the bill of fare and, finding there few dishes to suit his taste, dare to rise and quit the table? "Who've studied this awful dinner question" know that the meal had best be a revelation. The gastronome who is not delighted by a surprise is yet to be born. The menu is no credential, no proof positive that the dinner as written will be the dinner eaten. It is subjected to the uncertainty that governs all things. A catastrophe may occur that will cause a hiatus unknown to the guest, but betrayed afterwards by the writing. I know of an instance in a well-managed household where something went wrong with the "pudding, wine sauce." Every time the menu was looked at the omitted dish caught the eye. What had happened to prevent the fulfilment of the promise given? The omission was not felt, as much had been already served and eaten and a variety of desserts followed, yet the wonder grew over the "want." If the menu is excluded from the table it yet has its place and use in a private house. It is much more important that your servants should be provided with one than that your guests should. It will save mishaps of many kinds in the domestic department. Fancy a dinner where the "bird" course was omitted through the forgetfulness of an excellent butler and his satellite. The host was unaware of the omission, but the hostess could scarcely conceal a look of blank amazement and dismay when she saw the small affairs, salt-cellars, etc., being removed, and the crumbs brushed away preparatory to the appearance of the dessert. Having implicit faith in her servant, she recognized the situation, knowing what contingencies—from the cat up—might cause the non-appearance of her delicacy. The future revealed the true reason ; the merry little songsters, "butchered to make a holiday," were discovered in the larder all intact, their bodies cold and stark and much reduced by the length of their flight through the kitchen. It is a good daily rule in families to have the bill of fare written and placed in the butler's pantry. It simplifies matters between he or she who waits and the cook. The proper dishes and plates can thus be prepared, and placed conveniently beforehand for the proper serving of the meal later. In the morning, when the housekeeper or housewife arranges her dinner, it gives very little additional trouble to write and place conspicuously in one appointed place the bill of fare for that day's dinner. In many homes it is the host's pleasure to overlook the table at the last moment, to relieve the wife of the responsibility in the serving of those things in which he is most interested, and of which he is the best judge—*i. e.*, the decanting of the wine, its proper temperature, the sharpening of the carving knife, etc. If such things are attended to previously, it saves worry and fault-finding. The latter duty is very necessary if it is the host's pleasure to carve. If the serving of any dishes depend on him, that he may do so properly and easily and judiciously, a menu should be placed beside him. By it he can forearm himself for his duties. Many shining lights in the social world do make use of the menu, establishing a precedent. Kings have had their heads chopped off, and others high in authority have likewise done many things one need not follow or emulate. A precedent is an excuse, not a reason. The trouble with most persons is that they are content to follow. They would rather do as some one else has done than exert their own minds. Whatever you do, do with your understanding. Among savages or civilized, the feast, banquet, or dinner is considered the highest testimonial of worth they can as fellow-men offer or accept. The invitation to "break bread" is a recognition of social equality ; the world can be polished off with other things, but the person who sits at your table is placed there out of respect ; he is present because he is individually wanted, and no higher compliment could be offered ; yet with all respect to one as a worthy barbarian or civilian one is considered first as a human being, as one whose hunger must be appeased, and whose appetite must be pleased and stimulated. The invitation is accepted on both counts. Why should the trust on the human side be accented? What is the use of a mind that cannot triumph over matter? The question arises as to how you would best keep green the memory of your feast—by the articles of food provided or by the delights of the reason. Some one will say, "You went there to dinner, what kind of a time did you have?" You produce the menu. Possibly the hostess lacked the divine spark, and the card bears testimony to the fact. Instead of a delicate and suggestive reference in handiwork to something, the season, guest, or dinner, you see the word menu in huge gilt and parti-colored letters strewn with something that sparkles and glitters. You hand it over in answer to the question, saying "It was all good." What a tumble for a hostess! She has made herself and her house beautiful, has bidden those the world holds high to meet you, has done all of that to cater to your mind ; yet, because the miserable piece of card-board remains, you are tempted to remember her by what she has provided for you as an animal. How would you best have the memory of your dinner kept green—by articles of food or by "reason and the flow of soul?" A bill of fare is a tribute to the cook, not to the hostess. Would you have it said, "More good things were eaten than said?" No excuse is needed for providing each guest with a souvenir. A card with a good sketch in water colors or in pen and ink, done on it possibly by the hostess or by some unknown or known artist, would be pleasing, and each guest would prize it. Why profane so lovely a thing with a list of articles from the butcher's, the baker's, and green-grocer's? The vulgarity of such a transformation is self-evident. If you can afford it, and your generous spirit pleases, bestow on each guest a souvenir of the occasion. I offer a suggestion—one evolved out of the wit of a clever young woman, and not in behalf of the autograph fiend either: It is that each guest shall write his or her name on the reverse of the card. The list would be a suitable reminder of the sitting down in peace at one table of men and women. It would really show what the hostess provided as a running accompaniment to what the person did below stairs. The motto preceding such a "bill" should be, "Good cheer, good wishes, good words."

WOMEN'S WORK.

SOME OCCUPATIONS IN WHICH MEN DO THE WORK OF WOMEN.

While it is true that women have to a great extent of late years taken to doing men's work, it is also true that some men do women's work. In California Chinese men are largely employed as domestic servants, and wherever Chinamen go they are chiefly employed in laundries. In many large laundries, where new shirts are done up, expert men are employed who make good wages. The reason why men are employed on new shirts is because the new shirts require more strength to iron them properly than shirts that have been previously laundered, and few women have the strength to do the work properly. In the State prisons men are commonly employed at laundry work, mainly on shirts. It is curious, by-the-way, how differently a Chinaman uses an iron from the method employed by women. When a woman uses an iron she begins with it at the right heat for use, and consequently it soon cools, and she consumes much time in changing her irons. The Chinaman, on the contrary, gets his iron very hot, much too hot for use. When he begins to use the iron he plunges it quickly into cold water. This cools the surface for a moment. The heat from the interior then begins to come to the surface, and continues to do so for some time, about as fast as it is cooled by use, so that the necessity for the frequent changing of irons is obviated. Worth, the man dress-maker of Paris, has counterparts in other countries. The largest producer of dress patterns for women in New York is a man, although his business has been for many years conducted in the name of his wife. The most expensive and best fitting dresses that women wear are tailor-made dresses which are made by men. The designs for new dresses are mostly made by men. The most expensive ladies' hats are made by men. The man milliner is proverbial. In the department of nursing, which is considered specially womens' work, many men are employed. Where patients are helpless, and require much lifting, it has been found necessary to procure strong men, because women are not equal to the hard labor. Sewing is especially women's work, but the very finest and best paid sewing is done by men in fancy tailoring. Since the introduction of the sewing machine the proportion of men sewers has increased in those branches where the work is heavy and requires strength for long hours of labor. Although cooking is regarded generally as women's work, the best paid cooks are men. In the great clubs, hotels, restaurants, and private houses where fine cooking is required, the best cooks are men. It is the men who have made cooking one of the fine arts. It is true, however, that the great artists in food

disdain to be called cooks, and are known as chefs, and they command salaries of which the average lawyer would be proud. House cleaning is looked upon as women's work, yet there are establishments that will clean a house from top to bottom and put it in order, and employ mostly men to do it. Boarding-house keeping is mostly women's business, but there are many large and successful boarding-houses in New York that are managed by men. Often they get two or three houses together, and the tendency of men in that business is to enlarge it so as to make these places approach the character of hotels. There are even men chamber-maids. On steamboats and steamships most of the chamber work is done by men. Even in large boarding-houses it has been found expedient to have men to do the chamber work.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, geese.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUITS.—Apples, bananas, grapes and oranges.

PRACTICAL RECIPES.

MUTTON AND RICE SOUP.—Take one quart of mutton broth and put to it a cupful of rice, when it is half cooked add a teaspoonful of chopped mint. When done season with salt and pepper and serve with bits of toast.

POTATO CROQUETTES.—To one pint hot potatoes, mashed through a sieve and seasoned with salt, pepper, and onion, if desired, add an egg and a little hot milk or cream. Make into croquettes, and roll in egg and bread crumbs. Fry in lard.

SCOLLOPED POTATOES.—One quart potatoes parboiled and sliced. Add one pint milk and put in a dish in layers with butter, salt and pepper. Bake three-quarter of an hour in hot oven.

VEAL PATÉ.— Three pounds veal, chopped fine, three slices of salt pork, chopped fine, three slices of bread, crumbed fine, three eggs, one quart milk. Season with salt and pepper. Bake three hours.

EGGS AND TOMATOES.—Heat half a can of tomatoes, and season them with salt, pepper, a lump of butter, and a little sugar. Boil six eggs until they are hard. Cut some mediumly thick slices of bread, dip them in the tomatoes, and put them in a baking dish, then put on a layer of slices of egg, then some bits of butter, a little pepper and salt, then more bread dipped in tomatoes, and so on till the dish is full ; pour the remaining tomatoes over, sprinkle bread crumbs on the top and bake.

LIVER CROQUETTES.—Boil half a pound of calf's liver until nearly done, mince it very fine, add a high seasoning of salt, pepper, chopped onion, parsley, sage and sweet herbs. Mix together, bind with a beaten egg, form into croquettes, dip in crumbs and fry in boiling lard.

CELERY CROQUETTES.—Cut some of the white stalks of celery into even lengths and stew until tender in milk. Let them get cold. Make a batter of the milk in which the celery was stewed, with an egg, pepper and salt, and half a teaspoonful of baking powder and enough flour to make it the right consistency. Dip the celery in this and fry to a golden brown in very hot lard. Drain on coarse wrapping-paper, and serve hot as possible.

BLACK COFFEE.

A STIMULANT THAT IS NOT A DRAIN ON THE NERVOUS SYSTEM.

The custom which prevails in New Orleans, and generally through the South, of taking a cup of strong black coffee in the early morning, is an intelligent one. The people of those malarial regions have long since demonstrated the fact that the custom referred to is of great advantage as a prophylactic. The individual experience of the writer for five or six years past is strongly in favor of the taking of a liberal cup of black coffee without sugar or cream, sandwiched in between two glasses of hot water before rising every morning at least one hour before breakfast. The various secretions are stimulated ; the nervous force is aroused ; an hour later a hearty meal is enjoyed and the day's labor is commenced favorably, no matter how the duties of the day and night preceding may have drawn upon the physique. Another cup of coffee at four in the afternoon is sufficent to keep the energies unflagged for many hours thereafter. Taken in this manner the full effect is secured : the stimulant devotes itself strictly to business, none of it is lost, and if the proper diet be taken at the proper times between (and the ideal diet for those who make large drafts upon their nervous systems and expect to have them honored, is hot milk), and if the above regimen be followed and accompanied by at least eight hours of sleep out of every twenty-four, the capacity for work is almost unlimited. How many of our patients who are victims of disease are ever consulted as to whether they have been accustomed to the habitual use of coffee or not? Take for instance typhoid fever—a long siege of suffering—a rocked and wrecked nervous system, the chances largely in favor of the patient having been an habitual drinker of coffee, but whether so or not, the coffee is usually not given, though strongly indicated, for the reason that it sustains and supports weary, worn nerves ; aids digestion ; keeps the alimentary canal, which is swarming with germs and putrefactive material in a more or less antiseptic condition (it has been previously shown that coffee is peculiarly destructive to the *typhoid bacillus*); helps to gently open the sewers of the system, being as it is a diuretic, a stimulator of the bile flow and other secretions ; allays the sense of fatigue and lessens tissue waste ; braces up the heart's action and rises arterial tension. We all know that to prevent a chill nothing is superior to a cup of good, strong black coffee.—DR. I. N. LOVE.

A BLINDING HABIT.

THE PERNICIOUS EFFECTS ON THE EYES OF GUM-CHEWING.

A Pittsburgh *Dispatch* reporter had a chat with J. Diamond, the Sixth street optician, a day or two ago, which puts a new phase on the effects of the gum-chewing craze that has spread from one end of the land to the other ; and it is doubtful if as many of the belles and followers of the habit will continue their chewing after they learn of one of its most injurious effects. Mr. Diamond said : "Does gum-chewing hurt the eyes? Most certainly it does, and that is one reason why I am so antagonistic to it and denounce it. Not only myself, but every scientific optician will tell you the same thing. And it is this, with its attendant injurious effects, that makes the habit so repulsive. Only yesterday I had for treatment the case of a lady who came after eye-glasses, and I thought it was strange her eyes were in such bad shape, unless there was some other cause than mere failure on account of age, and it couldn't be on that account, because she was just in the vigor of life, and very handsome. So I knew there must be some other cause. I questioned her about her habits of living, and discovered that she had chewed gum from the time she was old enough to know what it was. Here was the cause without any further looking. Why, she had to take the highest power of glasses I had, and her sight was as bad as though she were eighty. The eye and the optic nerve are the most delicate organs we possess, and they can't be abused with impunity. The constant chewing of gum affects the nerves that lead from the spine to the optic nerves, and strains the latter until they are weak and give out. It is the same, to a degree, with tobacco-users ; but gum-chewing is worse, as its victims chew more constantly, and so keep up more irritation. I frequently have cases that are caused by this same habit. Many young ladies who continue the habit feel its effects, and I have a good many cases lately of very young girls with poor sight and weak eyes that, as I find by the use of my instruments, and from inquiry into the habits of the sufferers, arise from no other habit than that of gum-chewing. If you will notice, gum-chewers do not have the brilliancy in their eyes, the vivacious and full-of-life look ; their physiognomy looks pale and unhealthy. If this habit is kept up as a craze, of course the effect on the eyes will be more evident still, as there will be more cases. Yes, if the newspapers show it up, and disclose its injurious effects, they may break up the habit."

A NATION'S NEEDS.

AMERICA A GOOD CUSTOMER IN THE MARKETS OF THE WORLD.

The American market is a gigantic institution, and its business is in correspondence with its magnitude. In the consumption of food, clothing, tools, implements, and the innumerable et ceteras that constitute the bric-a-brac of comfort and luxury, we surpass all other countries according to the ratio of population. We figure on the statistical slate as less than one-twentieth of the world's inhabitants, but on the invoice of consumption we are placed as absorbing from one-quarter to one-half of the great staples of the world's production. In the matter of sugar, the American love for the granulated syrup is proverbial. The world's crop of sugar is placed at 5,114,620 tons, and of that enormous mass of prepared saccharine this country consumes 1,422,000 tons, 28 per cent. of the whole product of the planet. The coffee-pot of uncle Sam has a commercial history and an enormous absorbing capacity for the narcotic berry. The total production of the world's plantations foots up at 856,000 tons, and of this amount we swallow a decoction of 265,000 tons, or 30 per cent. of the product. Of what we wear as apparel and use in the millinery of home comfort, we figure high among the nations that wear clothes, and have evolutionized their wardrobe from the fig-leaf of the ancestral Adam. Our consumption of wool is more than a quarter of the world's known production, and if, as computed by some statisticians, we use 60,000,000 pounds of what the sheep's skin gives to man, our consumption of the whole would be nearly one third. Out of 11,421,000 bales of cotton, of 400 pounds each, we use 2,685,000, a little over one-quarter of the total. The india rubber product of the globe gives one-half of its output to the United States. We buy up more than half the tin dug out of the earth, and burn 40 per cent. of all the coal that finds its way from the mouth of a pit to the grate of a stove or the door of a furnace. The world's production of iron is 24,000,000 tons, and of that mineral product we consume 8,000,000 tons, or about a third. The steel industries of the world pay us the compliment of handing over of manufactured metal for American use 3.385,732 tons, out of a total product of 10,500,000 tons, being about a third of what

the Vulcans of the globe run out of their furnaces. In the use of copper we take about 50 per cent. and of lead a much larger proportion. The means of purchase and of appropriating so huge a slice of the world's loaf for the American consumer are traceable to many causes, material as well as economic; and every phase of politico-economics claims the honor of appetizing the American market. On that point men have an ample margin to disagree, but none dispute the historic fact that the invoice of the national market is the index of its capacity and prosperity.—*Western Tobacco Journal.*

THE WORLD OF WATER.

WHAT EXISTS AT THE BOTTOM OF THE SEA.

At the depth of about 3,500 feet waves are not felt. The temperature is the same, varying only a trifle from the ice of the north pole to the burning sun of the equator. A mile down the water has a pressure of over a ton to the square inch. If a box six feet square were filled with sea-water and allowed to evaporate under the sun, there would be two inches of salt left on the bottom. Taking the average depth of the ocean to be three miles, there would be a layer of pure salt 230 feet thick on the bed of the Atlantic. The water is colder at the bottom than at the surface. In many bays on the coast of Norway the water often freezes at the bottom before it does above. Waves are very deceptive. To look at them in a storm one would think the water travelled. The water stays in the same place, but the motion goes on. Sometimes in storms these waves are forty feet high and travel fifty miles an hour—more than twice as fast as the swiftest steamship. The distance from valley to valley is generally fifteen times the height, hence a wave five feet high will extend over seventy-five feet of water. The force of the sea dashing on Bell Rock is said to be seventeen tons for each square rod. Evaporation is a wonderful power in drawing the water from the sea. Every year a layer of the entire sea, fourteen feet thick, is taken up into the clouds. The winds bear their burdens into the land, and the water comes down in rain upon the fields, to flow back at last through rivers. The depth of the sea presents an interesting problem. If the Atlantic were lowered for 6,564 feet, the distance from shore to shore would be half as great, or 1,500 miles. If lowered a little more than three miles, say 19,680 feet, there would be a road of dry land from Newfoundland to Ireland. This is the plan on which the great Atlantic cables were laid. The Mediterranean is comparatively shallow. A drying up of 660 feet would leave three different seas, and Africa would be joined with Italy. The British Channel is more like a pond, which accounts for its choppy waves. It has been found difficult to get the correct soundings of the Atlantic. A midshipman of the navy overcame the difficulty, and a shot weighing thirty pounds carried down the line. A hole is bored through the sinker, through which a rode of iron is passed, moving easily back and forth. In the end of the bar a cup is dug out and the inside coated with lard. The bar is made fast to the line and a sling holds the shot on. When the bar, which extends below the ball, touches the earth, the sling unhooks and the shot slides off. The lard in the end of the bar holds some of the sand, or whatever may be on the bottom, and a drop shuts over the cup to keep the sand in. When the ground is reached a shock is felt, as if an electric current had passed through the line.—*Ocean.*

SEAWEED GLASS.—Seaweed is now made into a tough paper, which takes the place of window glass. When colored the effect is similar to stained or painted glass.

CHEAP ALUMINUM.—The production of metal aluminum by electrolysis at a cost little above that of tin is what some French chemists are sanguine of being able to accomplish.

HOT-HOUSE POISON.

WILL HANDLING FLOWERS DEVELOP BLOOD POISON?

The handling of cut flowers from the hot-house, according to the *Sun*, has within a fortnight developed among the assistants of several of the prominent florists cases of blood poisoning not unlike that which the men who handle hides down in the Swamp district are afflicted occasionally. Assistants who got their fingers pricked with the thorns of cut roses and other rough-stemmed flowers found that inflammation set in rapidly, with all the symptoms of mild blood poisoning. Physicians examined the hands of one of the florists and discovered that poisonous matter had been introduced into the blood through the wound made by the thorns, and drew from the patient the explanation that the only way in which he could account for the poison was that Paris green, and some other powders were used in the hot-houses to kill bugs and other vermin, and that some of the powder must have adhered to the flowers after they were cut and shipped to the city. It was reported that six assistants in one up-town florist's had been poisoned within the fortnight, and had been obliged to wear kid gloves to protect their hands. There were cases in other flower stores. The poisoning manifests itself by an eruption of pimples all over the hand. There is nothing dangerous about it, but it causes considerable inconvenience to the flower handlers, and it has caused the florists to adopt greater precaution to prevent the same thing happening to purchasers of flowers

BUSINESS NOTES.

VILLACABRAS.

A couple of years ago M. Branciard, a Frenchman, travelling through Spain, happened to stop at Villaconejos, a small township of the district of Chinchon, province of Madrid, and learned there of the existence of important mineral springs in the neighboring valley of Villacabras. Having taken samples of the water, he submitted them to the professor of chemistry of the University of Lyons, the eminent Dr. Crolas, who analyzed the same and pronounced the water a peerless purgative one. A company was started for the purchase of the springs and the sale of the water, and in a very short time Villacabras has become the most popular purgative water in France. After a careful analysis by the municipal laboratory of Paris the sale of this water was authorized in France by the government, and on a report of Prof. Brouardel, President of the Parisian Board of Health, it was endorsed and highly recommended by the "Académie de Médecine." The merits of this water were acknowledged shortly afterwards by the juries of the International Exhibitions of Paris, Nice, Bordeaux, and Toulon, where Villacabras was awarded gold medals and the great diploma of honor. Since, no less an authority on therapeutics than Professor Dujardin-Beaumeta has repeatedly recommended the use of Villacabras in his clinics at the "Hôpital Cochin" (see *Therapeutic Gazette* of January 15, 1890). In his lecture on the treatment of constipation, for instance, he says: "To the list of French waters, such as Montmirald Valqueyras, to the Hungarian purgative waters so widely known, has been added a newly discovered water, which is by far the most highly concentrated water known. It is a Spanish water, like Rubinat, exclusively *sulfated sodique*, but considerably stronger than Rubinat." (See *Bulletin Général de Thérapeutique*, April 15, 1890). In a communication to the Société Générale de Médecine his Excellency Mavrogény Pacha, head physician to the Sultan of Turkey, highly endorses the use of the water, and says: "I find it superior to all the German and Hungarian waters known as bitter waters, as its taste is not offensive, and it acts quite efficaciously under a small volume without disturbing the stomach or bowels." Since its introduction in this country the water has been prescribed by such medical authorities as Drs. Fordyce Barker, T. G. Thomas, W. T. Lusk, A. A. Smith, Leonard Weber, G. H. Wynkoop, W. B. Anderton, J. Williston Wright, C. S. Ward, and others, and has been highly recommended in clinical lectures to students. (See New York *Medical Journal*, August 30th, page 1: "Lectures on Pulmonary Diseases," by James R. Crook, M.D. See brochure on Rheumatism and Gout by F. LeRoy Satterlee, M.D., pages 46 and 75). Dr. Chandler, Dean of Columbia College, gives of the Villacabras water an analysis which shows that it owes its great superiority over other waters to the large quantity of sulphate of soda, a mild and non-irritating purgative, which it contains, there being in the crystallized condition 9340.5765 grains of sulphate of soda to a total of 9726.1416 grains of purgative salts in a U. S. gallon. Being highly concentrated, it acts very efficiently under a very small volume, does not gripe nor produce any binding after-effects, as the majority of purgative waters, and has no bitter taste or repulsive smell. We are indebted for the above information to various foreign medical periodicals, namely, to the *Moniteur de l'Hygiène Publique*, under the signature of Dr. Dupouy, and to the *Bulletin Général de Thérapeutique*, by the well-known Professors Léon LeFort, Potain and Regnauld. Our conclusion is the same as Dr. Chandler's, who says in his report of February 10, 1890, on the Villacabras water: "I am confident that the medical profession will find it very useful in cases where this kind of water is required."—*Journal of Balneology and Dietary.*

THE VICTOR PRESS.

We call attention to the advertisement of Geo. Ertel & Co., Quincy, Ill., in another column of this issue. That the Victor Press is one of the most perfect presses on the market is shown by the fact that Messrs. Ertel & Co. have the largest factory in the world devoted exclusively to the manufacture of Baling Presses. They offer to ship a press on trial to any point in the United States or Canada, to work against any other make, the party testing them to agree to buy the one doing the most and best work for the least money.

FOR INSOMNIA

Use Horsford's Acid Phosphate. Dr. O. E. Bingham, Elgin, Ill., says: "I have used it in my practice for the past ten years, and am well pleased with the result."

FOR DYSPEPSIA

Use Horsford's Acid Phosphate. Dr. F. H. Welty, Hamilton, Va., says: "I have tried frequently and always with most satisfactory results. Nothing is equal to it for treatment of dyspepsia and various complications resulting from disorders originating in the stomach. I consider it invaluable."

COVERED LIVES.—There are lots of people in this world who wear silks and velvets on top, with a carefully covered garment of sackcloth and ashes underneath.

ELECTRICITY WINS.—The Paris Gas Company is said to be the first of the important European gas companies that shows a visible decline distinctly due to the increase of electric lighting.

COPYING PRINT.—Printing can be copied on any paper of an absorbent nature by moistening the surface of the latter with a weak solution of acetate of iron, and using an ordinary copying press.

AMERICAN GLASS.—There are at least six plate glass manufacturing companies in the United States, who have an annual product of nearly 12 000,000 feet. This exceeds the entire production of Europe fifteen years ago.

SOCIAL OPPOSITES.—There are two things needed in these days: First, for rich men to find out how poor men live, and, second, for poor men to know how rich men work.—*Edward Atkinson.*

PIE IN THREE STYLES.—Here is the story of a susceptible reporter for the Chicago *Times*: "In a little town a few miles down the road on the Chicago, Burlington and Quincy, is a regular old-fashioned tavern. The dinning-room is most attractive, employing for waiters some half-dozen sweet, rosy cheeked country girls. How I admired one beauty I saw there—such a rosebud mouth, and what eyes and hair! When I was ready for dessert she came for my order. 'Pie or pudding?' she queried. 'Well, I asked, 'what kind of pie have you?' 'Oh, we've three kinds—open face, cross-bar, and kiver-top— all made uv apples.' Shades of all departed grace! And with such a face and form!"

TEA AND TEACUP.—A man who argues that one pound of tea makes 400 small or 300 ordinary size cups states his case as follows; Tea testers ordinarily use a silver 5-cent piece for weighing the exact quantity required for a cup. As there are about twenty-five 5-cent pieces to an ounce, and as there are sixteen ounces to a pound, it follows that one pound of tea will actually make 400 cups, according to the standard of strength ordinarily required by professional testers. The cups used for this purpose contain, however, one-fourth less than the average domestic teacups. It will therefore be seen that after making due allowance for the difference in the size of the cups the number will be very close to 300.

HOT SAND.—A writer in the *Nightingale* says: "The sand-bag is invaluable in the sick-room. Get some clean, fine sand; dry it thoroughly in a kettle on the stove. Make a bag of flannel about eight inches square, fill it with dry sand, sew the opening carefully, and cover the bag with cotton or linen. This will prevent the sand from sifting out, and will also enable you to heat the bag quickly by placing it in the oven or even on top of the stove. After once using this you will never again attempt to warm the feet or hands of a sick person with a bottle of hot water or a brick. The sand holds the heat for a long time, and the bag can be tucked up to the back without hurting the invalid. It is a good plan to make two or three of the bags and keep them on hand ready for use at any time when needed."

CLEVELAND'S
SUPERIOR
Baking
Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is
THE STRONGEST
of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

Sold by druggists or sent by mail. 50c. E. T. Hazeltine, Warren, Pa.

Maid for easy Housework

-Pearline. *Made* to save work and wear in all kinds of washing and cleaning. *Made* into a powder for your convenience. *Made* as cheap as pure soap for economy. *Made* harmless for all purposes for which soap is used. *What a friend*—a friend who did half your washing and cleaning and made the other half so easy that you did not get too tired to enjoy the time saved; besides made things last longer and look better. That's just what Pearline will do for you if you'll let it. On the back of each package you'll find how it will best befriend you. Every grocer keeps Pearline, and many of your friends use it—ask them about it.

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.*

180 JAMES PYLE, New York.

POPULATION OF JAPAN.—Official returns show that the population of Japan on December 31, 1889, was 40,072,020—20,249,336 males and 19,825,684 females who ocupied 7,840,572 houses.

SILENT CALL.—One of the latest inventions in connection with the electric light is a silent cab call. Several clubs and hotels in London have already been supplied with this useful commodity. Two lamps are suspended outside the building, one red and the other green, and by pressing a knob in the entrance hall one or other of the lamps can be lit at will. The red light calls a four wheeler, and the green a hansom.

ENORMOUS VINE.—The largest vineyard in the world—that of Senator Leland Stanford—is in Tehama County, Cal., and consists of 3,825 acres, or about 3,000,000 vines. California also has the smallest vineyard in the world—the one grape-vine in Santa Barbara County, which is seventy years old, has a diameter of one foot twelve inches from the ground, and whose branches cover an area of 12,000 feet. This one vine produces from 10,000 to 12,000 pounds of grapes.—*The Argonaut.*

ROYAL TIPPLES.—There are plenty of delicacies at the Queen's dinners, as a matter of course; and there is always an adequate number of elaborate made dishes, which Mr. Osborne termed "ongtreys," but there are also invariably some plain joints, both hot and cold. Prince Albert was always pleased to see a cold sirloin of roast beef on the sideboard. The Queen has throughout her life shown a marked preference for perfectly simple fare. Prince Albert and the late Duke of Cambridge greatly relished that good old-fashioned dish, roast sucking pig, served with prune sauce. The Queen has an immense cellar of wine at Windsor, and supplies are regularly sent from the Castle to Osborne and Balmoral. Champagne and claret are the wines in most constant use, but there is a splendid collection of Cabinet Rhine wines, some extraordinary old sherry—Wiliam IV drank no other wine—a great quantity of port, including nearly all the best vintages, and some of the finest imperial Tokay in the world. Prince Albert always drank a bumper of Tokay after dinner, but since his death it has seldom been seen at the Queen's table. Apollinaris water is much favored both by her Majesty and the Prince of Wales, and the Queen's favorite whiskey comes from the well-known Lochnager distillery on the Balmoral estate.

THE BEST HE COULD DO.—A western newspaper recently received the following answer from a person who was requested to act as subscription solicitor: "From a perusal of your sample copy I consider your paper to be a dicknailer of the first water; but, owing to the fact that the crops were a failure last year, and the blizzard in January wiped out the cattle, and that the population in this place is only two families and a water tank and one of the families is away at the hot springs, and the other one, which was only Jed Roach himself, is dead since December, and as, dear sir, I am going East, because I have no society except freight trains and telegraph messages, that do not stop as they pass by, I do not think it would pay me to make much of a boom for your paper here, even if you increased the commission and threw in a three-bladed pocket knife. You asked me to hand your letter to some other person in my town, provided I cannot work for you myself. I have no one to hand it to, but I will nail it on the water tank when I leave."

USES OF SOAPSTONE.—A writer has recently called attention to the unappreciated uses and preservative qualities of soapstone, a material, he says, which possesses what may be regarded as extraordinary qualities in withstanding atmospheric influences, those especially, which have so much to do with the corrosion of iron and steel; and, from experiments made, it is said that no other material is capable of taking hold of the fiber of iron and steel so readily and firmly as this. In China soapstone is largely used in preserving structures built of sandstone and other stones liable to crumble from the effect of the atmosphere; and the covering with powered soapstone in the form of paint, on some of the obelisks in that country, composed of stone liable to atmospheric deterioration, has been the means of preserving them intact for hundreds of years.

HAY EXCHANGE.

The N. Y. Hay Exchange is located at 601 W. 33d St., corner 11th Avenue.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles. sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Feb. 9, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Prime Hay	60c @	55c @ 60c
No. 1	55 @	55 @
No. 2	50 @	50 @
No. 3	45 @	45 @
Shipping	45 @	45 @
Clover mixed	45 @ 50	40 @ 50
Clover	40 @ 45	40 @ 45
Prime Rye Straw	85 @ 90	50 @ 55
No. 2 "	85 @	
Oat and Wheat	55 @ 65	45 @ 50

Receipts of hay, 30 per cent. below last week.

Receipts of hay rather light, and accumulated stock well cleaned up, but no improvement in prices.

Shipping and No. 2 Hay in small bales is in less demand than any time this season owing to the falling off of cattle shipments.

Rye Straw is weak at 90c., although most of the sales for the past week have been made at that figure. We know of a few instances where receivers have yielded to the pressure of the buyers to lower the price, and sold at 85c.

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$14.00 to $15.00
Hay, choice to fancy, perpetual pressed bales	12.50 to 13.00
Hay, fair to good	11.00 to 12.50
Hay, poor to ordinary	9.00 to 11.00
Hay, Clover and Clover mixed	9.00 to 10.00
Hay, swale	8.00 to 9.00
Straw, Rye, good to prime	17.00 to 18.00
Straw, Oat	9.00 to 10.00

BOSTON, Feb. 7th, 1891.

Receipts for the week are 373 cars of hay and 29 cars of straw; corresponding week last year, 385 cars of hay and 40 cars of straw. The receipts continue large and in excess of demand. Market is weak and decidedly in buyers' favor. There are occasional cars that sell at our outside quotations, but such are exceptional.

Rye straw is quiet at quotations.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

A VICTUAL SHOW.

The retail grocers of this community are about indulging in one of the characteristic splurges by means of which they periodically boom their business, individually as well as collectively, under the pretence of an overwhelming zeal for pure food. These emotional experiences were manifested for several years by so-called "National Conventions" in Washington, whose invariable result was to prevent the adoption by Congress of any really useful legislation on behalf of the consumer. The hollowness of such advertising shows was, however, too apparent, and next month we are to be entertained with a "Food and Health" exposition in this city, the profits of which are to be devoted to the erection of a club room of some sort for the entertainment of the wily sand-sprinkler and his unkempt but frolicksome subordinate. The management has shown laudable shrewdness by engaging as director of the enterprise Mr. A. B. De Freece, a gentleman who has displayed peculiar skill and aptitude in promoting and managing large public entertainments in this city in support of various charitable institutions; but any particular reason why the charitable impulse of the community should be concentrated just now on a broad scale upon the corner grocer is not immediately apparent. Instead of combining to build him a club house, it seems to us that the wisest action would be to organize a missionary movement for his conversion. The apparent impossibility of success should not prevent the experiment. Providence, we feel assured, would smile more benignly over the astounding spectacle of one reformed retail grocer than it can be expected to do over the erection of an Exchange building, where unregenerate adulterators may gather together to concoct in unison their lucrative and indigestible combinations. So much about the general purposes of the undertaking. Its special advertising opportunities are innocently exposed by the director, who has called attention through the daily press to the fact that there will be on exhibition designs for sanitary dwellings, water filters, water fittings, sanitary funiture, refrigerators, wall-paper, floor coverings, life-saving and health-saving devices, improved clothing materials and garments, displays of unprepared animal and vegetable substances used as food or in the preparation of food, prepared cereals, meals, flour, biscuits, breads, syrups, sugars; prepared animal substances used as food, products of the dairy, beverages of all kinds, new varieties of food, food for infants and invalids, articles and devices used in the cooking and preparation of food: cooking stoves, ranges, vessels for preserving food, barometers, etc. All of which, we may add, will be vastly edifying—to the exhibitors.

WOMEN'S NATIONAL COUNCIL.

There has been organized a national council of women intended to represent all the independent work done by women in the trades, professions, and philanthropy. The organization took its origin from the International Congress of Women three years ago. It is proposed to hold a meeting every three years, the next meeting to be held in Washington, February 22d to 25th. From February 19th to March 4th, special railroad rates can be obtained, in all territory east of the Mississippi River. The delegate or other man or woman intending to be present at some session of this congress will pay one full fare from her home, asking at the same time for a certificate of purchase. This certificate will, after signature by the Congress Committee entitle her to a return ticket at one-third the usual rate. The interests of Women's Clubs, will be represented at this Convention by Mrs. Ella Dietz Clymer, President of Sorosis, and Mrs. J. C. Croly (Jennie June), President of the New York Woman's Press Club; the religious work of women by Mrs. M. Louise Thomas, of New York, and Mrs. Emily L. Sherwood, of Washington, D. C., Mrs. Ann Garlin Spencer, of Providence, R. I., has been invited to prepare a paper for the session, which will be devoted to the consideration of the relations between various social reforms. Dr. Julia Holmes Smith, of Chicago, has been invited to represent the Queen Isabella Association.

A DEPLORABLE SITUATION.

The import duty on manufactures of mother-of-pearl was raised by the McKinley bill from thirty per cent. to forty per cent. ad valorem; consequently the subjoined description of distress among the school children of Vienna, where the mother-of-pearl industry is most extensively conducted, cannot be charged against that legislative enactment, though an effort has been made by some unscrupulous newspaper writers to do so. The statement is made that of 294 boys and 216 girls in a school in the Herzgasse, 70 boys and 42 girls are without shoes and 149 have no winter clothing Of 616 pupils in a girls' school 90 are without shoes and 112 without winter clothing. In a boys' school 102 pupils wear no shoes at all, or only wooden shoes, and 102 are without winter garments. In many other public schools, frequented by workingmen's children, the condition of affairs is not better. In the three schools mentioned 858 pupils receive their luncheons from the Central Society for Feeding Poor School Children, The luncheons consist of a plate of vegetables for each child. On holidays, which are numerous in Roman Catholic Austria, these children get no luncheons at all, because, as the Society's last report says, they can never get at home more than dry bread enough for their breakfasts and suppers. This extreme poverty, resulting mostly from the stagnation in the mother-of-pearl industries, has been rendered acutely painful by the unusual severity of the weather. Hundreds of shoeless and half-clothed children are obliged to wade daily through snow and slush to and from school. All the Vienna dailies are publishing appeals for help for the starving and freezing school-boys and school-girls.

GALLIC GRATITUDE.

The French Government is about to erect a monument to Jean Nicot, who introduced tobacco into France. Nicot, while Ambassador to Portugal in 1560, sent a package of tobacco seed to the queen, Catharine de Medici, in Paris. The weed throve so well in French soil that sixty years later Cardinal Richelieu found it worth his while to begin collecting the first French tobacco tax. In 1697 this tax was 40 sous on the hundred pounds. Shortly afterwards the annual product of the tax was some $50,000. In 1718 the right to the product of the tax was let out to the collector for $3,200,000. Between 1719 and 1730 the tax was not collected. It was reintroduced at the latter date, and in 1791 was again abolished. Napoleon I. in 1810 began collecting the tax by means of a Government monopoly. The first empire got some $8,000,000 annually from the tax, and in 1830 the product was

$9,000,000. In the following half century the tax grew to $48,000,000. Altogether, the tax has brought the French Government $1,800,000,000. No wonder that enthusiastic French smokers have suggested that the Government could well afford to commemorate in pure gold the fame of Nicot.

CATERING SCIENCE.

HOW THE FOUR HUNDRED ARE PROVIDED.

Catering is an art, so is cooking, but the relation between the two is that of architecture and building. Twenty-five years ago it was practised with difficulty. As an art it had no recognition; as a profession it lacked impetus, the general opinion being that a house had to be built especially for entertaining purposes, or the affair celebrated in a public hall or hotel. If a wedding was to take place the baker made the loaves of bread and cake, and neighboring cooks were borrowed by the bride's family to roast the game, poultry and joints, a month or a fortnight being consumed in the preparation of the wedding feast. Now that is all changed, and, by the present system, the work of a week is performed in one hour, and the family is spared all worry, care and vexation. New York caterers are the envy of their profession for the reason that they have access to the finest market in the world. There is absolutely nothing in the line of table luxuries, excepting perhaps the perishable fruits of South America and Southern Europe, which cannot be had in season in our markets. By means of cold storage transportation the delicacies of all countries are levied on and placed within the reach of the New York buyer with systematic regularity. With these unparalleled facilities in marketing, the question of mere refreshment is the last to be considered in giving an entertainment. People who live well, whether they are in society or not, know what is in season, and when they give an order for a spread very often make out their own menu. Then comes the all-important—to the caterer—question of time. Take for instance, a ladies' reception from 2 to 6. A very dainty tea can be served at $1 per guest, for the reason that very little will be eaten. People are too wise to spoil their appetite for dinner, and are content with an ice, coffee, or cup of bouillon. If, however, the hours are from 4 to 8 or 7 to 10 the guests will have their dinner appetites with them, and five times the quantity of food will be consumed. The greatest difficulty the caterer has to contend with is the incessant demand for novelties. Duplicates are undesirable and the repetitions will not be tolerated. Patronage exacts not only skill but originality and ingenuity. Each entertainer wishes to surpass the efforts of her neighbor, and, although the basis of every French sauce is truffles and onions, the cry is a new sauce. As I said, in former times only the people who lived in big houses pretended to give entertainments. The modern caterer is so superior to surroundings that a suit of three rooms in a mansion or a flat can be admirably arranged for a dance, a wedding or a dinner, and a barn-like studio converted into an ideal banquet-hall or ball-room. New York has miles of beautiful homes where it would be impossible to suggest improvement, and where the service of a meal is a positive delight to the caterer. There are other houses in which the dining-rooms are filled with fighting colors and antagonizing furniture, and the man who invades it must be careful to find out just how perfect it is in the estimation of the family before attempting to pull down an inquisitor in bronze, cover a convulsion in stained glass, or spread a drugget of soft charitable linen over the war-whoop design in the carpet. In other words, he must feel his way; but, given possession of the rooms, whether intended for a dining or a dance he is in a better position to score a success, both for the entertainer and himself, than if restricted. In the dining-room, of all other apartments, three things are essential—fresh air, space, and soft light. In a dark, crowded, overheated room the groundwork for dyspepsia is laid before the soup course. Eliminate some of the furniture so as to give the table room, brighten the corners with a palm or two, a branch of candles or a sconce, pull down some of the heavy hangings, substitute a bamboo portiere, or lighten the windows with white sash curtains, and the interior as once becomes roomy and inviting, and the spread appetizing. In serving a dinner for twelve or less, we generally use the family china and plate. People who can entertain that number at a course dinner have as a rule perfectly appointed closets. Often the furniture is magnificent. I could name many houses possessing gold services, including epergnes and candlesticks, but, oddly enough, they are rarely used on the table, serving merely as ornamentation for a buffet or cabinet. There is nothing finer than silver and white linen, and nothing is more universally used in the cultured and wealthy homes of New York. For the private dinner neither care nor expense is spared in preparing the menu. Often the demands for novelties are unreasonable. Not long ago a lady, particularly anxious to make her dinner party famous, wrote to me, "I want something that is not in the market." In the matter of decoration we are guided by the flowers that are to be used, and, whatever the color, arrange the shades of the candles, the favors, bonbons, ices, etc., to match. Much is written about colored table drapery, but white linen remains the standard. Occasionally at a wedding breakfast or supper the board is draped with lace, which is crumpled up, and posies of the bridal flower pinned in the folds. This is a pretty but very expensive fancy, for unless the lace is fine the effect is cheap, and if it is valuable there are the risks to be taken in the pinning, and also the service of liquid foods. Occasionally a tea or luncheon is spread on a bare mahogany table, but the mats needed to protect the polished wood produce a spotty effect, suggestive of a doll's banquet or children's party. While the flowers are less abundant than formerly, no table is considered finished without some decoration. Among the wealthiest people orchids are preferred. They are best displayed in a tall epergne. Flowers of decided perfume are avoided; they do not harmonize with the savory smell of roast birds or the aroma of coffee. For that reason care is taken in buying roses to choose the nephetos, pear, or some other variety that has been forced at the expense of fragrance. Ferns are always pretty on a dinner table. So are marguerites and jonquils, asters, tulips, marigold and sweet pea. Tall, feathery palms are most graceful, but the difficulty is to get a jardiniere or vase that will not obstruct the view. Menu cards are not used at a home dinner. At a stag assembly or banquet, where toasts are proposed, they are essential. The guest cards are general when there are honored guests or strangers in the company. The family monogram or crest, engraved in gold or silver letters, often appears above the name inscribed, and the date may or may not appear. Incidentally, favors are not in favor, except at cotillons. If touches of color are needed, some simple and inexpensive fancy form, in the shape of a miniature flower, hat or box, is selected and filled with crystallized or artificial flowers or both, the candies being inside, and a spray of violets fastened to the cover over the guest's name. To load a table with toilet articles, bric-à-brac or personal ornaments, is no longer the fashion. Any one can buy a paper-knife, cigarette-case, match-box or button-hook, which articles, however useful and admirable in their way, have absolutely no place on an elegant table. Fifteen years ago it took time to serve a spread. An order for the entertainment of 200 would require a week's notice. Now a New York caterer will fill such an order in one day, and serve a dinner of ten courses to ten or twenty guests on two hours' notice. I remember discussing this very question with a celebrated caterer of Paris, and when I told him that in New York a gentleman could order the banquet hall arranged for 200 on his way to business, and find everything in readiness by 7 o'clock for the reception of his guests, he said, "Oh, that's one of your American yarns; I understand it." As an illustration of the way a caterer works on short time and in small space, let me cite a case in Washington Square. A gentleman called Monday. He desired to entertain 200 young people at a Wednesday night dance. There were only three rooms on the floor, and I was told to make the best of them. A man was sent to the house to look over the field. This is his report: "Drawing-room, medium size; adjoining parlor, dark; dining-room beyond, small. First two, hard wood floors; will need waxing; range, too small. Remove all furniture and line walls with cotillon chairs. Curtains in both doorways to come down. Send vans, and have furniture men move all statuary into the corners of the room. Light is insufficient, and a lantern is needed on the turn of the staircase. Limit floral decorations to lambrequins of smilax or some airy, graceful festoons of rose-buds and foliage for the doorways. Open fireplaces, and fill with tropical plants." That day the services of a gas-fitter were secured, who designed a quaint iron fixture with small branches, each arm containing a rocket, into which the bowl of a princess lamp was fitted, the two fixtures or brackets being attached to the picture moulding. The iron was then gilded, the lamps were shaded with pink, and when lighted the whole floor was ablaze. At 4 o'clock Wednesday afternoon two furniture vans backed up to the house, and everything on the floor was moved out and the vans sent to the storage, to remain untouched. At 5 o'clock the canopy was put up, and the entrance lighted. At 6 o'clock the fireman put the kitchen in order, set up a gas range, and attached a plate heater. At 7 o'clock seventeen waiters arrived, each carrying a dress-suit case, and followed by the wagons and trucks containing the tables, chairs, supplies and table furniture. The dining-room was so small that it was necessary to stack the tables in piles of three, as fast as they were set, each table being spread for four guests, each pile representing a dozen covers. When the seventeen piles were stacked in that lofty old colonial dining-room, it was all the men could do to get the doors closed and get out. At 10 o'clock the cooks arrived and proceeded to prepare supper, all the dishes being ready to go in the oven or on the fire. The cellarman came half an hour later to cool the wine, and at 11.30 o'clock supper was served. It took the waiters seven minutes by actual timing to arrange the tables about the two parlors, seat the guests in the cotillon chairs, and get the first course out. The meal consumed about one hour, and the tables were removed in ten minutes and without any inconvenience to the company. This clearing-out process is largely a matter of individual system. Formerly each waiter carried a table out. Now they move in procession, man and table alternating, whether entering or leaving a room. By this method and a signal for a march, it is a very easy thing for the waiters to start from the dining-room or hall door with the little tables, quietly pushing the promenaders out of the drawing-room into the hall and have the parlors arranged for supper by the time they reach the point of starting. When an entertainment is continued after midnight, the house is not cleared till the following morning. The next day our wagons were at the door at 7 o'clock, and before our men had the goods out the men on the furniture vans were ready to carry the drawing-room and dining-room furniture in. When the family came down to breakfast the house was in regular order. In all orders over fifty the caterer supplies everything—the food, wines, table paraphernalia, chairs, dancing crash, etc. The wear and tear on the service is very large. The moment a piece of linen shows wear it is retired, and the smallest chip from a piece of china or glassware ends its usefulness. We figure on a loss by breakage of 10 per cent. on every order, and very often suffer 50 per cent. In bad weather our men meet with unavoidable accidents,

often falling on an icy sidewalk or area step and smashing whole sets of dishes. Sometimes there is a runaway, and whole supplies as well as table paraphernalia are lost. For out-of-town and country orders we expect to lose 15 per cent. of our ware in breakage; and then there are the special orders for picnics, coaching and yachting parties, where the profits do not begin to cover expenses. I don't think we had a single yachting order last summer that paid us. In one instance our losses were particularly heavy: we had three large hampers ready to go on board when the gang-plank gave way and every thing was thrown over. One case contained 300 pieces of silver. As in all accidents we had to stand the loss. In private houses we very rarely loose anything. Small tableware, like spoons, forks, sugar-tongs and salt-cups are very often missed, and invarably found in the garbage-box. Large pieces of plate and linen are easily traced. They have the name plainly inscribed and are consequently useless to anybody else. At public entertainments, where large companies are provided for, the breakage is enormous. The question of suppers has always been more or less of a problem to the hostess, and just now is undergoing analysis. While all subscribe to the hospitality of refreshment, the feeling prevails that a heavy meal is not desirable before midnight unless at a ball, and then only for the dancers. For the last year or two the spreads have been perceptibly lightened, delicate pates, salads and croquettes replacing game, scallops, and hot dishes. A new departure from the conventional supper-table was made by Mrs. W. K. Vanderbilt at her now famous musicales. Instead of serving her well-fed, amply dined guests a hearty meal she introduced novelties in light refreshments. Immediately after the programme, twenty-five waiters in evening dress circulated through the lower rooms carrying silver platters, on which they passed cups of bouillon, frou-frous, ramiquens—a delicate puff filled with foi gras—ices, small cakes, bonbons, bonbon frappe, orgeat glace, and champagne. The guests strolled about and the servants followed them, offering some of whatever delicacy they had on the platter, or awaiting their order. The old fashioned luncheon served at noon and which grew into a dinner is no longer in favor. To-day the breakfast is a real French breakfast served from 12 to 2, and made up of little relishes such as toast with cavier, anchovy, egg or sardine paste; a light entree such as chops, sweetbread, a bird or pate; salad, celery, croquettes; fruit, an ice or meringue, coffee and white wine. The great charm about these breakfasts is simplicity, both in the decoration and menu. With a wedding breakfast the greatest latitude is allowable. The most elaborate one of the year was that sent to Chicago for the wedding of Mr. Marshall Field's son, which cost the millionaire dry-goods merchant $125 a cover, and forty were served. The bridal table was made in a heart. Along the edge was an eighteen-inch ribbon of white satin, with a valance to match, over which fell a fringe of gold. On this narrow border the plates, glasses, forks and knives, etc., were placed, and the rest of the board was covered with a heart of lilies of the valley containing 5,000 flowers. In the field was a gold arrow, tied with red ribbons. At each plate was a cake-box of pale lilac satin tied with yellow, the bridal monogram being embroidered in violet. Mrs. Field's gold service was used, and the glass was the beautiful Rococo. The other tablets were long ones, draped with rich lace, crumpled up, and bunches of natural violets pinned in the folds. Breakfasts can be served at $5 a plate, although that price would not cover the wines. There is a tendency to increase the number of invitations to wedding breakfasts, but as a rule not one-third of the guests are seated. Where one thousand or more are entertained, buffet tables are spread in the halls and library or gallery, and the guests are served standing. Not unfrequently a special staff of waiters is assigned to the people on the staircase in order to refresh everybody at once before there is time to leave the house. This is a graceful compliment, and one that the men especially appreciate. Afternoon teas are served from 3 to 8, 4 to 7 being the most fashionable hours just now. Of all these afternoon entertainments the coming-out tea is the most elaborate, but even that is simpler than formerly in point of refreshment. No limit is placed on the decorations. Flowers are everywhere, in all the rooms and in the greatest profusion. As at the dancing party white canvas is laid, unless the carpets are light, in order to get the bright effect desired. In the dining-room more care is bestowed upon the arrangement of the table than upon the viands, the object being to guard against over-furnishing or overloading. In the collation now ordered sandwiches are served in variety; tea, chocolate, champagne punch, the latter in a service by itself; ices, bonbons, almonds and marrons. Coffee is not on the list, and even pates are rapidly disappearing. At the regular afternoons, tea and cakes, with champagne or claret punch, is quite sufficient. Heretofore fashion has shut out the sunlight. Now shades are raised to the top of the sash and the sunlight allowed to stream in through lace drapery at all morning weddings and breakfasts. On all tables where a light is required wax candles or princess lamps are preferred to gaslight. I neglected to say in connection with weddings that only one loaf of cake is boxed—the groom's, or black cake—the bride's white loaf having entirely disappeared. Nor is it any longer the fashion for the bride to cut the cake. Where the rooms are large it is the custom to have the bride's table set on a dais raised from six to eight inches above the others. It is the work of the caterer to look after the proper heating of the house, and very often he reserves the privilege of building a new fire to lessen the heat, or turning it off altogether, and putting hard coal or gas logs in the grate. Where a large company is invited very little heat will be needed on the parlor floor. At all dancing parties the steam or furnace heat is turned off entirely in the afternoon and the house thoroughly aired. If the rooms are lighted two hours before the time set for the entertainment they will be the right temperature when the dance begins. The comfort of the guests is the first duty of the hostess. It is a mistake to think that a caterer takes cooked supplies to his patrons and warms them over before serving. No such methods are employed. Vegetables, croquettes, pates, birds and roasts of all kinds are sent to the house in bake-pans or kettles, seasoned and garnished ready to go into the oven. Coffee, chocolate and tea are freshly made, so are sauces and salad. Bouillon and soups are readily canned and iced or heated for table; cakes and breads are ready, but biscuits are freshly made, if ordered, and all delicate desserts are specially prepared in the house of merriment. In consideration of all this hasty cooking the range is carefully studied by the chef, who would never think of trusting to the family servants for a fire. He not only builds a fresh fire—often cleaning the chimney or putting in new stove lining—but acquaints himself with the range even to the extent of trying the oven. If he has any suspicion of its baking qualities it is ignored and a gas range set up, with appliances for heating plates, etc. The cellarman who goes to the house to look after the wine will ice champagne in half an hour, although a day or two may be consumed in the work of siphoning and decanting the claret. In filling an order from 10 to 15 per cent. more provision is provided than the guest list calls for, in order to have a comfortable surplus. If we run short of anything in the city, fresh supplies are readily procured. Occasionally a parsimonious customer is encountered who orders for 150 and entertains 200. In that case the reputation of the caterer is at stake and the head waiter, alive to the situation, wires the firm for an extra supply. The host may see fit to hold us to the original agreement or estimate, in which case the caterer has the alternative of playing the agreeable or closing all further dealings. In the matter of cost various things are to be taken into consideration. Every fluctuation in the market has an effect and so has bad weather. Then there are rushes at the holidays and beginning of Lent, when it is almost impossible to fill late orders, for the reason that extra help is required, and the right kind not always available. One dollar a plate is about the minimum cost at which an entertainment can be furnished, and then the refreshments are of the simplest kind, including sandwiches, chocolate, and an ice or tea and cakes. There is not much difference in the expense of breakfasts and dinners, which vary from $5 to $125 a plate. Formerly fashion called for an estimate; now sketches are in demand. The caterer, who is at once decorator, draughtsman and artist, goes to the house, looks it over carefully, gets ideas from the suggestions of the family, makes pen and ink sketches showing how the various rooms in the house could be appointed, where the tables will be, and the movements of the servants, which are submitted for approval. Tables are carefully and minutely drawn and colored if the design is for a novelty, so that the hostess is able to see her dinner or tea a month before it occurs. It goes without saying that these sketches add to the bill of expense. I remember the lunch party Mrs. Gen. Butterfield gave in honor of Mrs. U. S. Grant, and the sleepless nights spent on the original designs. No two tables were alike. One represented a fan in which pink and green ribbons suggested the sticks stretched over a field of rosebuds and ferns; a second was a fleur de lis, a third a heart, another a three-leaf clover. A caterer never takes anything back. He has no use for it. Generally the family orders the remnants sent to the charity patronized, and if no such disposition is ordered we favor the Little Sisters of the Poor.

LOUIS SHERRY

YEAST BACILLI.—Yeast was discovered fifty years ago to be composed of minute oval particles endowed with life, and the recent bacilli investigations have again turned attention to the subject.

SANITARY ROPES.—Wire rope manufacturers say that the dread of insects and infection in ordinary rope has banished the latter almost entirely from the the household in favor of their own production.

TO PRESERVE COLORS.—Drapers and others showing window goods liable to lose color by fading, are advised to put yellow-colored glass in their windows, as the bleaching is caused by the white rays of the sun's light.

BOILED STARCH.—The digestibility of starch is greatly increased by prolonged cooking, says Dr. N. Butiagin, and since the ptyalin value of saliva is diminished by disease, starchy food for invalids should be well boiled, in his opinion, three or four times as long as ordinarily.

PIGEON DIPHTHERIA.—The French medical journals report another instance in which diphtheria appears to have been transmitted from pigeons to man. One of these birds died, and a veterinary surgeon found, *post-mortem*, that diphtheria had been the cause of death. From this bird its owner, his daughter and a child were infected.

PROTRACTED STUDY.—In the University of Coimbra, Portugal, fourteen years are now required to obtain the degree of M.D., six being spent in obtaining the ordinary education, three in a preliminary scientific course, and five in purely medical studies. Now the students complain because the final examination is conducted in Greek.

WISE JAPANESE.—No kissing ever occurs in Japan, except between husband and wife, not even between a mother and child, no shaking of hands in salutation. If one were to offer a kiss to a Japanese maiden she would probably think she were going to be bitten!

MINERAL WATER GERMS.—The examination of Vichy water in bottles, commenced in Germany by Reinl and in America by Ninges, has given alarming results, nearly all of the bottled mineral waters having been found to be charged with germs (*Progres Med.*—N. Y. Times). Temperature, pipes, pumps, etc., are elements of much influence on the number of germs in the bottled waters. It is recommended to modify the methods of bottling, to subject them to steaming, as well as the corks, just before the introduction of the water.

AERIAL TRAVEL.

LATEST PHASE OF THE SCIENCE of AIR NAVIGATION.

The sprightly Washington correspondent of the *Boston Transcript*, writing under date of January 31, says, and our readers may accept as much of it as they see fit: "Before long a line of air-ships will be running between Washington and Baltimore. These vessels, built to traverse the atmospheric route, will not be balloons of any sort, but will depend for their flotation in the air upon what are called aeroplanes. An aeroplane is a framework made so as to hold extended horizontally enormous sheets, one above the other, of canvas or other material. It is designed to imitate in its operation the soaring of a bird, as will presently be described. Beneath the aeroplane hangs the car for passengers, the entire apparatus being afloat; though on the Washington and Baltimore line the car will be connected with a wire below that runs from one city to the other. A current of electricity will pass along the wire, giving the propulsive force, just as in the case of the street-car with an overhead wire. Such is to be the first step in practical aerostation. To realize its importance as a new scientific departure, it must be understood first that the two great difficulties recognized as obstructing the progress of the art hitherto have been the problem of steering and the weight of the motor. The latter obstacle has seemed well-nigh insurmountable, inasmuch as, whether steam or stored electricity was used, the apparatus necessary to work the propelling fans was so heavy as to be a hopeless load. But, mark you! this sort of air-ship does not have to carry any motor at all, its fans being worked from a dynamo station at a distance, by means of an electric current passing along the wire referred to and up to the vessel by the two wires which connect it with the aforesaid wire that runs all the way from Baltimore to Washington. As for steering, the wire does that, the two connecting wires running along on trolleys, just like the street-car spoken of. In short, to be sure that it is all clear, there is the great aeroplane 200 feet from the ground, the passenger-car hanging beneath it, and two wires connecting the car with the Washington to Baltimore wire strung on earth-driven poles far beneath. Obviously, it should be explained next by what principle of mechanics this extraordinary contrivance called an aeroplane is expected to support itself and the car it carries. That is the whole point of the idea. Did you ever see a bird fly? How does it sustain itself in the air? By flapping its wings. Not so. The best flyer cannot sustain its own weight by flapping. It takes advantage of the buoyancy of the air-currents, which at great heights even, where the atmosphere is rarefied and therefore harder to float in, upholds the eagle and the frigate-bird, soaring for hours with unmoved pinions or poised aloft so motionless that a telescope can be trained upon them. And yet either of these birds, starting from the ground, is obliged to take a long run before being able to rise into the air. So it is with all big birds, while the small ones have to begin with violent flapping, which they cannot keep up more than briefly. When practicable, birds prefer to start their flight from a high perch, because gravity gives them a helping impulse. How is it that Hermann, the prestidigitator, is able to throw playing cards easily from the stage into the fourth gallery of the biggest theatre? Simply that the card, given a skilful impetus, is upborne by the air-currents. A toy kite is a still better illustration. Well, that is the entire notion of the aeroplane, which, with its great expanse of horizontal areas, is actually sustained by the currents of air. Suppose a case, easy to understand, of one of these air-ships on its way to Baltimore at a speed of fifty miles an hour, the day being absolutely calm. This means a fifty-mile current of air, of course, in effect. It opposes the progress of the vessel but very slightly, because the latter presents merely the edges of its planes to the breeze. The captain at the helm inclines the planes upward a trifle at the front, so that the powerful air-current is made to exercise its lifting power and keep the craft afloat. But whichever way the current comes the planes are governed accordingly. The wing planes on either side are slanted slightly upward, so that any tendency to tilt will develop greater pressure in that direction, and thus restore equilibrium. Two most important discoveries have recently been made in this connection: One by Professor Langley, secretary of the Smithsonian Institution, to the effect that the resistance offered by the atmosphere to such an aeroplane as that described is only one-fiftieth part of what has hitherto been supposed, implying that so much less motive force is necessary. The other is that the power of the propeller for producing speed in air is vastly greater than has up to this time been dreamed of. Intense interest is felt by Professor Langley in the problem of aerial navigation, and in his investigations of the subject he is being assisted by J. Elfreth Watkins, the well-known expert in engineering and the science of transportation. In truth the matter is being taken up to a surprising extent nowadays by practical engineers. The foremost advocate of the practicability of the idea, Professor Octave Chanute, is to be next president of the American Society of Engineers, his name appearing on all four of the election tickets. And yet, only ten years ago, a man who had the temerity to so much as deliver a serious lecture on the prospects of navigating the air would have ruined his professional reputation by the indiscretion. A short time ago there was much talk in the newspapers about an Illinois company that promised to run aluminum air-ships between New York and Chicago, carrying passengers from one city to the other in six hours. The first ship was advertised to start by the first of January, but the scheme has failed to materialize thus far, and it seems to have developed some symptoms of a fizzle, though it is claimed that the fault is that of contractors who did not supply certain materials as quickly as had been agreed. There is great excitement in the district round about Mt. Carmel, where the building of the ships is going on secretly under sheds; but not so much as a car has been put together yet, and it is reported that difficulty is being experienced in soldering the aluminum. Well, one would rather smile; for the fact is that no one has yet discovered a successful method of soldering aluminum, and it is not all unlikely that no one ever will. Of course, aluminum is being employed for its lightness; but if it has to be riveted instead of soldered, it will have to be so thick that the object aimed at will be lost. Largely on account of this matter of soldering, it looks at present as if the possibilities of aluminum were as yet rather limited after all. This question of aerial navigation is the last transportation problem remaining for man to solve; the doubt is no longer whether he will solve it, but how. Science is now for the first time applying its serious attention to the subject. It is apt to be thus with great inventions. First they are imagined without especial design by dreamers; next the more imaginative inventors try to carry them out, and finally men skilled in mechanics reduce them to concrete form. Be it understood incidentally that no company has actually been formed as yet for establishing a line of air-ships between Washington and Baltimore; but people here who understand more about the flying question than is comprehended anywhere else—for this is a centre of investigation of the subject—are firm in their conviction that there will be such a line as that described at the beginning of this article before ten more years have gone by. It is not asserted that the attached wire plan is the best possible, but merely that it is likely to be the first step, the immense point in its favor being that it solves the steering difficulty at once and does away with the necessity of carrying a motor. Presumably the aeroplane and its car would have to be started from a height. Most inventors of flying machines find this essential. For example, a funny old duffer from New England came to Washington not long ago for the purpose of securing a patent on an apparatus for volitation of his own design. To convince the skeptical patent examiners that his machine would really work, he equipped himself with it and calmly and confidently flew off from the high abutment alongside of the Patent Office steps. He only flew as far as the pavement below, however, damaging his nose very much and bruising himself rather badly, for the fall was twenty feet or more. Theorists in aerial navigation are at present divided into two schools—the aeronauts who believe in balloons for purposes of support, and the "aviators," from the Latin avis, a bird, who reject the balloon altogether and advocate mechanical means, in imitation of winged creatures. The aviators may be said to be again divided into three classes—the flappers, who think that the flapping motion of wings should be imitated mechanically; the screw lifters who are of the opinion that propeller-shaped fans should be employed for raising the contrivance in the air as well as for propulsion; and the believers in the aeroplane principle, with propellers for go-ahead motion. The aviators declare that the gas-bag must go; it is unscientific, unmanageable, and not to be relied upon. And yet the aeronauts assert with truth that cigar-shaped balloons can be run now on a calm day in any desired direction, by means of propellers, at the rate of fourteen miles an hour. In fact, the thing has been repeatedly done. They say that a speed of from twenty-five to thirty miles is within sight. But the aviators reply that, though this may be true, yet such improved balloons could not carry many passengers or much cargo, nor could they go up at all on unpleasant days; in short, resort must be had to another form of apparatus altogether for real practicability. It is worth mentioning, by the way, that wonderfully clever mechanical birds, which actually will fly quite a distance, have been made in France; but their principles do not seem applicable to flying machines on a large scale. The motive power utilized in those toys is twisted india-rubber, which has more power, weight for weight, than the finest steel spring. It is a comfort to know that the faster the aeroplane air-ship travels the more easily it is upheld, though there would seem to be some danger of a spill occasionally, caused by an unexpected cross-current or by a slight unsteadiness on the part of the steersman. Such an accident, occurring at even fifty miles an hour, and an elevation of 200 feet or so above the ground, would be apt to be unpleasant. However, what is the use of accident insurance if one cannot take risks in travelling? Indeed, the speed attained is practically indefinite, depending merely upon the size of the fans and the rate at which they are made to revolve. In order to sustain the considerable weights necessary to be carried, the aeroplane and car will be obliged to traverse space at a rate far exceeding the flight of the fastest birds, and a journey across the continent will be accomplished in scarcely more than a few consecutive twinklings.

GUN COTTON.

THE SAFEST EXPLOSIVE WHEN PROPERLY HANDLED.

Gun cotton, said Professor Munroe, in a lecture at the Lowell Institute, recently, is pure cotton dipped in a mixture of pure nitric and sulphuric acids. In seeking a method by which these ingredients might be obtained absolutely pure, and the cotton thoroughly treated with the acids, many years have been spent and serious accidents have occurred. According to the Boston *Journal of Commerce*, the lecturer traced the experiments with the explosive from its discovery, in 1832, up to the present time, and spoke of several of the most fatal explosions which attended the experimental stage. After experiments by Professor Hill, of the United States torpedo station, gun cotton was adopted as an explosive for use in the navy in 1884. In preparing it for this service the gun cotton is, by successive pressings by hydraulic presses, the last of which has a pressure of 6,800 pounds to the square inch, made into little blocks measuring 2½ inches each way. It now

contains from 10 to 16 per cent. of water, but when issued to the service contains 35 per cent. Before being made up into blocks it is carefully tested. Professor Munroe declared that gun cotton, correctly prepared and handled according to directions, was the safest of the explosives to use. It was dangerous only when the materials had not been thoroughly purified, or the union of acid and cotton incomplete. In proof of what could be done with it, a picture was thrown upon the screen showing the workman cutting it with chisel, jig saw and lathe to fit it into a shell. Another illustration was the extinguishing of a block that was burning by pouring water upon it. Two thousand pounds of it had been burned in a bonfire without an explosion. One volume of the explosive gives 829 of the gas, and the pressure developed by combustion is eighty-one tons to the square inch, and by detonation 157.5 tons, the latter being in contact, however. The effect of the explosion of one particle on another is so rapid that it would take only one second for it to pass through 19,000 feet of the explosive. It was shown by the stereopticon that the letters U. S. N., with the date of manufacture, that are on the bottom of each block, are impressed upon an iron plate upon which the gun cotton may be exploded. It is a curious fact that, if the marks on the block are in relief, the reproduction on the iron will be raised, and, if cut in, there will be an indentation on the plate. Professor Munroe's theory is that when the letters are cut into the explosive the gases generated in the indentations are hurled from them as a projectile from a gun. If a leaf or a delicate piece of lace be laid between the gun cotton and the iron, its impress will be left in all the perfection of outline of the original, though the article itself is absolutely annihilated.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, geese.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUITS.—Apples, bananas, grapes and oranges.

PRACTICAL RECIPES.

TOMATO PUREE.—Put two cans of tomatoes in a saucepan with a quart of hot water and seasonings of half a teaspoon of salt, a little onion, a pinch of cayenne, eight whole peppers, four cloves, a bit of mace, and let it simmer for half an hour, being careful that it does not burn. Then pass it through a fine colander or sieve. Wet half a teaspoon of flour with a quarter of a cup of cold water, rub smooth, fill the cup by tablespoonfuls with the tomato and pour it into the soup; taste for seasoning, simmer a moment, and you have a rich, thick soup, which may be thinned out with more water if necessary.

CHEESE OMELET.—Beat three eggs, add to them a tablespoonful of grated Parmesan cheese, pour into a hot pan; fry and fold in the usual manner. Just before folding add a heaping tablespoonful more of cheese and turn out on the hot dish. Dust a little Parmesan on top and serve.

OYSTER PIE.—Line a pie-plate with a good crust. Remove the tough part from twenty-five good-sized oysters, and put them in the dish, sprinkling through them salt, pepper, cayenne, powdered mace, and bits of a small sweetbread that has been cooked; sprinkle in a few fine bread crumbs. Add to the oyster liquor a little milk and a lump of butter, thicken it slightly with flour, and pour over the oysters; cover with a crust and bake.

CARAWAY SEED CAKES.—One cupful butter, one cupful sugar, five eggs, two teaspoonfuls baking powder, one quart flour, caraway seeds, and enough milk to make it just soft enough to roll out; cut into cakes with a cutter and bake a light brown.

CARAMEL CUSTARD.—Melt some pulverized sugar in a mould; brown, but do not burn it; take it from the stove and run the caramel all over the mould, and then fill up with a rich custard made of the yolks of ten eggs and two cupfuls of rich milk or cream, sweetened and flavored. Steam gently for not quite three-quarters of an hour and serve cold.

SPONGE-CAKE PUDDING.—Cream together half a pound of sugar and quarter of a pound of butter; add to this four well-beaten eggs, a pint of cream, and enough stale sponge-cake crumbs to make it rather thick; add a little baking powder and bake in individual pans.

WAFFLES.—Three eggs, two heaping cupfuls flour, two cupfuls milk, one-quarter pound of butter, one-quarter yeast cake. Let them rise over-night; bake in hot irons.

WOMEN'S WORK.

WHAT SOME KANSAS WOMEN ARE CREDITED WITH ACCOMPLISHING.

According to a writer in the Lawrence, Kansas, *Star*, the young Kansas farmer goes out into the field at daylight, and by nightfall has cribbbed 150 bushels of corn. The young man's sister can play the piano, do the housework, and in busiest times goes out with the men, and does so much work as to astound her best friends. A pretty Dickinson county girl, aged 15, drove a self-binder over 1,200 acres, and took good care of the four horses hitched to the machine. During the spring she helped to plant 120 acres of corn, did the housework for a family of seven, went to ten dances, tried twice to elope, taught the most interesting class in the Sunday school, and now talks of going to Africa as a missionary, and says, if the Lord speaks out loud enough she will go among the lepers. A Brown county girl looked after her father's grape patch of ten acres, picked the apples on 1,000 trees, and when her male parent pocketed $5,000 from the sale of the fruit did not ask for any of the money—because she knew she wouldn't get a penny. She believes in the Alliance principles, can play tennis, row a boat, or ride the wildest horse in the county. Another young woman living in Irving township worked in the harvest field as well as a man, herded cattle and sheep for several summers, and this winter will teach school. She has three young sisters, who are following in her footsteps. The bright daughter of a "squaw" man on the reservation wants a white husband—and she is worthy of one. Her sister married an Indian, and her father gave them a farm and a curse. He thinks the unmarried one is too good for an Indian. She has taught school, driven race-horses and won, has never been beaten in a trade, equals any man in the county in fleetness of foot, can shoot with the best of them, and would work her hands off for her parents' sake. A Lincoln county girl got her father to give her a farm and lives on it, looking after eighty acres without help, and last year cleared $1,000 besides buying clothes, machinery, and stock. This year she has a girl friend for a companion and a hired man. A woman sixty years old has farmed near Notawaka with continuous success. Her place is small, yet she makes money, and gives liberally to the needy. She never leaves her farm except to attend the meetings of a woman's suffrage society. A Hiawatha woman, who has a husband helpless from rheumatism, has kept him and a large family of children by directing work on an eighty-acre farm. She is a zealous worker in church and Sunday school, and says she owes no one a cent. Her farm and buildings are in better shape than those of her more fortunate neighbors. There are hundreds of bright women and girls who have taken up claims in the western part of the State who manage to keep men depending on them from going hungry; there are hundreds of women who can do anything a man can do, has ever done, or ever tried to do, and there are hundreds of women in Kansas who want equal rights with men. The signs are that what they ask will be conceded them. They have taken charge of the public schools, and no State in the Union has better. They are members of the school boards, county and city superintendents and teachers. They lead in the education and prohibition movements. They are making no noisy or threatening clamor for equal rights. They are simply showing by what they do that they are the equal of man, and that the ballot in their hands would not only be safe but wisely used for the development of a State that is coming to the front with greater strides than any other in the Union.

BAROMETRIC PLANTS.

WEATHER PREDICTIONS IN THE VEGETABLE KINGDOM.

The *Petit Traité de Meteorologie Agricole*, by Mr. Cana, contains a list of prognostics *apropos* of the aspect than certain plants present according to the state of the atmosphere. The following are a few examples: If the head of the gith (*Nigalla sativa*) droops, it will be warm; if the head of the same plant stands upright, it will be cool; if the stalks of clover and other leguminous plants stand upright, there will be rain; if the leaf of the wood sorrel turns up, it is a sign of a storm; if the leaf of the whitlow grass slowly bends up, there will be a storm; if the flower of the convolvulus closes, it will rain; if the flower of the pimpernel closes, it will rain; if the flower of the hibiscus closes, it will rain; if the flower of the sorrel opens it will be fine weather; if the flower of the same plant closes, it will rain; if the flowers of the carline thistle close, there will be a storm; if the flower of the lettuce expands, it will rain; if the flower of the small bind-weed closes, look out for rain; if the pitcher plant turns upside down, it will rain; but, if it stands erect, it will be fine weather; if the flower of the cinque foil expands, there will be rain; but, if it closes, the weather will be fair; if the flowers of the African marigold close, it will rain; if the scales of the teasel become close pressed against each other, it will rain.

GREEN TEA.

THE VARIOUS KINDS KNOWN IN COMMERCE.

For commercial designation, there are five subvarieties of green teas, known as Gunpowder, Imperial, Hyson, Young Hyson, and Twankay or Hyson Skin. Gunpowder takes its name from its small, firm, kernel-like form. The three chops or gatherings are also the means of further subdivision, the first being the smallest and most delicately flavored; the second is larger in size and not quite as hard rolled, while the third is looser in make, irregular in form, and with markedly less strength and perfection of flavor. The latter, with the older and coarser leaves of the other chops, is largely made into Imperial, which is known to the Chinese by the name of Big Gunpowder, and differs from its less bulky namesake principally in the size of the leaves, and but slightly in flavor. Its name is due to the fact that it is the make of the tea used in

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. MCGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

Descriptive pamphlet free.

RUMFORD CHEMICAL WORKS,
PROVIDENCE, R. I.

BEWARE OF SUBSTITUTES AND IMITATIONS.

Caution:—Be sure the word "Horsford's" is *printed* on the label. All others are spurious. Never sold in bulk.

the household of the emperor, as well as by the mandarins and the wealthy classes generally. Young Hyson differs from Gunpowder only in the fact that its leaves are curled or twisted, instead of being rolled; the difference between its three chops being very marked, as to the fineness and perfection of finish of the leaves. Hyson bears the same relation to Young Hyson that Imperial does to Gunpowder, while Hyson Skin is composed of the refuse and rejected leaves of all the finer grades. For this reason its quality, as well as its appearance, varies greatly; without considering at all the question of adulteration, which is easily possible with a tea of this heterogenous make-up, it is likely to be found equal in quality to the best Gunpowder, or wretchedly weak and poor.—*Good Housekeeping.*

PNEUMONIA.

Pneumonia has many terrors for most people, because of the large percentage of fatal cases (about 30 in 100), the suddenness with which a fatal issue is reached, and the excruciating pain that accompanies the first stages of the disease. Pneumonia results from exposure to wet and cold, and is, therefore, more common in the winter than in the summer, and in the Northern States is more prevalent in the spring than any other season in the year. Excessive use of liquor conduces to the disease in its most malignant and fatal character. Cigarette smoking is not productive of the malady, but a person addicted to this habit is regarded by physicians as a more likely subject for attack than one who does not smoke cigarettes. Pneumonia seldom attacks children under five years old, and attacks occur even more rarely between the ages of five and ten. It is more common among men than among women. Pneumonia, or pneumonitis is a very old form of illness, but up to the beginning of the last decade was more generally known as lung fever. It is an inflammation or congestion of the lungs, and there are four distinct classes of the malady, known as lobar, lobular, fibrous.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

and caseous, or tubercular pneumonia. The two classes last mentioned not infrequently terminates in phthisis or consumption. The first stage of pneumonia is known as the stage of "engorgement," the second stage as "red hepatization," when the lungs become the the color of the liver. When this brownish color gives way to gray the malady has reached the third stage, called the stage of "gray hepatization." This is the stage of "absorption" in favorable cases, when convalescence ensues. In unfavorable cases the disease passes into the purulent stage, when death is likely to ensue in a very few days; it sometimes comes in a few hours. The first symptoms of pneumonia observable by the ordinary patient is a pronounced chill, frequently accompanied by rigor. Invasion is abrupt. Immediately after the chill, and sometimes while the chill continues, the patient experiences a severe pain within a circumscribed space at or near the nipple on the affected side. The pain in character is lancinating, very much resembling that caused by a stab. A racking cough and expectoration soon follow. This is the stage in which the oval bacteria is found in the sputum. The symptoms noticed by the patient are now a fever of a temperature of from 103 to 105 degrees, pain in the head, anorexia or loss of appetite, severe thirst, prostration, a hot skin, pulse varying from 80 to 120, full and hard and increased respiration. The patient finds much difficulty and pain in breathing, and is compelled to breathe shortly and quickly. It is very often the case that patients do not at once take to their beds. There are many cases of pneumonia that physicians call "walking cases." Patients suffering with pneumonia frequently walk into the hospitals. In the second stage of the disease the patient's pain may cease, but the cough may continue, though less hard and painful. In the third stage the patient, if the symptoms are favorable, will cough less, respiration will resume its normal condition, appetite will return, and pain will almost, if not entirely, disappear. Once convalescence begins in cases of pneumonia, however, recovery is almost certain. Fatal relapses are very infrequent. Pericarditis, or inflammation of the membranous sac which encloses the heart, is a very grave complication in pneumonia There is much difference of opinion among physicians as to different methods of treatment, but there can be no doubt that to relieve the system from all unnecessary exertion and thus give nature a chance to do the curing is the one which generally succeeds best. Relieve the bowels and digestive system by using Ayer's Cathartic Pills and assuage the cough by Dr. J. C. Ayer's Cherry Pectoral and you will not go amiss. In many cases the use of these approved remedies will act as a preventive after a severe cold, and by curing the cold prevent pneumonia.

PAPER SHOE STRING.—A machine for making shoe strings out of paper is a recent Philadelphia invention.

TRANSATLANTIC COLD.—The cold weather in England raised the death rate in London to thirty per thousand.

TO PROMOTE POPULATION.—French parents possessing seven or more children have certain exemptions from taxation.

VINEYARD FANCY.—It is asserted by French vintagers that the grapes gathered at sunrise always produce the lightest and most limped wine.

HEAVY COIN.—The largest gold coin in circulation in the world is the "loof," a gold coin worth $325. It weighs over a pound. It circulates in Anam, Asia.

DANGEROUS PETS.—A French scientist declares that the domestic pets of the world carry at least thirty per cent. of the common contagious diseases from house to house.

NEW ANTISEPTIC.—Lysol is the name of a new antiseptic, which appears to consist of saponified tarry oils. It mixes readily with water. The preparation is as yet a secret.

ELEPHANT'S BRAIN.—The brain of an elephant is remarkably small, not more than one-twenty-third as large as that of a human being in proportion to the weight of both.

CRUSTACEA AND BACTERIA:—A French savant has discovered that the phosphorescence in crustacea is owing to the presence of bacteria in the muscles—in other words, disease.

ROUGH ON DOCTORS.—The Georgia Legislature is considering a bill to punish doctors and druggists who become drunk. For first conviction a fine of $200 is proposed, and for the second the license to practice revoked.

A DEAD SEA.—Black Sea soundings are said to show that below the depth of 600 feet the water is so impregnated with sulphurated hydrogen gas, emanating from decaying animals and vegetable matter, that living organisms are not found there.

CANCER BACILLUS.—Dr. Russell, senior pathologist at the Edinburgh Royal Infirmary, claims that he has discovered the cancer parasite, which he maintains he has traced to a fungus of the yeast type. He is still pursuing experiments in this department of research.

WISE CAUTION.—The Berlin police have ordered that all buildings taking consumptives to be treated by Koch's "lymph" must be disinfected, like those inhabited by diphtheria patients. Further, all patients must be registered at the nearest police station.

BOGUS DIPLOMAS.—Another bogus medical college has been unearthed in a small Vermont town. It is not incorporated, owns no building, and numbers among its faculty a telegraph operator, a newspaper reporter, and some doctors of doubtful repute living hundreds of miles away.

INTERESTING INQUIRY.—Two chemists are experimenting at Freeport, Pa., with a view of producing carbon points for electric lighting from natural gas. It is said that by burning the gas in a specially prepared furnaces, pure carbon is obtained, but as yet at a cost too great for practical purposes.

ANÆSTHETIC CHAIR.—A new chair has been brought out by the Medical Battery Company, of Oxford Street, London. An electric current renders the patient insensible to pain when an operation is being performed on him. If this be true, the days of laughing-gas, ether, etc., for dentistry are numbered.

BULGARIAN SENSE.—Bulgaria is not ranked highest among the civilized nations. But if in its borders a patent medicine is advertised to cure a particular disease, and fails to do so, the vendor thereof is liable for damages and imprisonment for publishing a lie by which the public is injured in health and purse.

NO BUDDENSIEKS.—In France architects are required to have diplomas, showing that four years have been spent in technical study. They are held responsible for twenty years for accidents in a building chargeable to their incompetency. They must be present in person or by a representative during the whole construction.

FOOLISH CHALLENGE.—Dr. H. S. Tanner, who fasted forty days, now lives near Clinton, Missouri. He now challenges Signor Succi to sit down with him in Chicago during the World's Fair to test the matter in a ninety days' fast on water only; or, if Succi prefers, let the fast continue from day to day until one or the other yields the contest.

COLORS ON METALS.—A steel color is developed on brass by using a boiling solution of arsenic-chloride. A concentrated solution of sodium sulphite causes a blue coloration. Black, as on optical instruments, is obtained from a solution of platinum-chloride, to which tin-nitrate has been added. In Japan, brass is bronzed by using a boiling solution of copper sulphate, alum and verdigris.

IMPERMEABLE GLUE.—To make an impermeable glue, soak ordinary glue in water until it softens, and remove it before it has lost its primitive form. After this, dissolve it in linseed oil over a slow fire until it is brought to the consistency of a jelly. This glue may be used for joining any kind of material. In addition to strength and hardness, it has the advantage of resisting the action of water.

A HIGH-GRADE PIANO

AT A VERY MODERATE PRICE.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Feb. 16, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Prime Hay	60c @	55c @
No. 1	55 @	50 @
No. 2	50 @	45 @
No. 3	40 @ 50	40 @
Shipping	40 @ 50	40 @
Clover mixed	45 @	40 @ 45
Clover	40 @ 45	40 @
Prime Rye Straw	85 @ 90	
No. 2 "	80 @ 85	
Short "	55 @ 60	
Oat and Wheat	45 @ 50	

Receipts week ending Feb. 14, as follows:

Via N. Y. Central	229 cars.
" West Shore	171 "
Other roads by Lighter, 34th Street	65 "
Total	465 cars.

Very little can be said to change the tone of the Hay market for the last week or two; and, although there has been considerable activity in trading, and Hay has been moving freely, there is no material change in the prices, as will be seen by the above quotations.

The stock of Hay on hand is comparatively small, and, unless the receipts increase to some extent in the near future, we do not look for a more discouraging state of the trade than has existed for several weeks past.

Prime Hay is scarce, and a *strictly fancy* article, should there be any, would bring 65c. in a small way.

Cheaper grades still in greater favor than the better qualities.

Rye Straw is a little dull, and the demand hardly equal to the supply; 90c. is an outside price.

BOSTON.

COMMISSION MERCHANTS,

HAY, STRAW, FLOUR & GRAIN.

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$13.50 to $14.50
Hay, choice to fancy, perpetual pressed bales	12.00 to 13.00
Hay, fair to good	11.00 to 12.00
Hay, poor to ordinary	8.00 to 11.00
Hay, Clover and Clover mixed	9.00 to 10.00
Hay, swale	8.00 to 9.00
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	9.00 to 9.50

BOSTON, Feb. 16th, 1891.

Receipts for the week are 334 cars of hay and 30 cars of straw; corresponding week last year, 307 cars of hay and 24 cars of straw. There is no change in the general condition of the market from what has previously been noted. The receipts continue in excess of the demand. Quite large stocks have accumulated, which the railroads are crowding receivers to move promptly. The market is weak and decidedly in buyers' favor. Our quotations are nominal and represent asking prices; they are frequently shaded, however, to effect sales.

Rye straw is easier, with a slack demand.

H. F. WILSON,

GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens,** in **Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

"BILLET"

are

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

BRIDGET DOOMED.

An ingenious New York lady who has a foudness for scientific experiments is reported to have lately turned her love for electrical engineering to practical account. She was without a servant, and determined to try whether she could not light the kitchen fire by means of a tame flash of electricity, so to speak, and then let it burn up before she got up herself. She prepared wires to and from her bed-head to the kitchen grate, thus completing an electric current with the aid of a small battery, and all that then remained to be done was to so "build" the fire that the materials should become easily ignitable. The wires were connected by a piece of platinum, and round this there was loosely wrapped what firework makers call "lightning paper." Over this again was strewn some tissue paper, upon it placed a wheel of firewood and on the latter the coal. At seven in the morning, when the fire had to be lit, the current was sent from the scientist through the wires. The platinum lit the lightning paper, then the tissue, the tissue the firewood, and the firewood the coal. When she descended to the kitchen the kettle was boiling and the place comfortably warm. She thinks she has done something towards the solution of the servant girl question.

ANTI-KIDNAPPING LEAGUE.

In the latter part of last year a new National Association was organized in this city, under the name of the "Anti-Kidnapping League." The purpose of this league is to hunt down every case of imprisonment of sane persons in insane asylums which it can hear of, and give such assistance as the case demands. The idea of the League originated with a Miss Lothrop, of New York, who was herself the victim of the kidnapping the society has been organized to prevent. She was incarcerated for two years in an asylum, and when she was released she began the work of exposing the evils of which she knew, at the same time working for the organization of a national society to prevent the kidnapping and incarceration of sane persons. The society was organized December 19, 1890, and many men and women of position and influence are included in its membership. It is said that the investigations of the League show that in seven years fifty-six sane persons were imprisoned in the Buffalo Asylum, and that this was admitted by the Asylum authorities in their reports. It is also asserted that the Utica Asylum admits that over one hundred sane persons have been imprisoned there in thirty years. The society admits in many cases there is no fault on the part of the Asylum authorities, but says that the fact that eleven sane persons are annually incarcerated in two institutions shows that in the numerous public and private asylums there is a field for the Anti-Kidnapping League.

THE SIBERIAN RAILWAY.

The great Siberian railway, which will more closely connect Europe with the teeming millions of China, Japan and Eastern Asia, will be commenced this spring. The total length of the line will be 4,810 miles, and the cost about thirty-two millions sterling. In case permanent bridges are built over the immense rivers Obi, Yenesei, Lena, etc., the outlay will be still greater. The commercial and political importance of this undertaking is greater than most people suppose. It will not only help to open out the immense resources of Southern Siberia, but will enable Russia to compete more successfully for the Japanese and Chinese carrying and import trade. Goods that are now sent by sea to Europe will ten years hence be carried overland into Europe, and a good deal of the Chinese carrying trade will go into the hands of Russia. A large portion of the railway will run through millions of acres of the finest virgin soil, over immense rivers, in primeval forests which have never been cut, and through countries abounding in mineral and vegetable wealth. When the line is ready it will be possible to work the rich gold, silver, iron, copper and plumbago mines of Eastern Siberia, which have hardly yet been touched in consequence of the scarcity of labor and the absence of machinery. The rich and fertile regions of the Amoor and Usuri, which boast of a climate as fine as that of France, will then be open to colonists, and also millions of acres of land which are at the present moment almost unpopulated. By means of this railway Russia will be able to convert Vladivostock into a great naval and military station like Sevastopol, and, if necessary, pour several hundred thousand troops on the Chinese frontier in less than three weeks' time. And last, and not least, among the benefits which will accrue to mankind through this undertaking, will be the possibility of visiting China or Japan in about a fortnight from Central Europe, with all that comfort that is attached to railway traveling.

COURAGEOUS PRUDENCE.

We hear and read considerable just now about business dulness and the necessity of retrenchment. Caution is always commendable, in good times as well as in bad, as long as it is accompanied by a resolute spirit, for it should be borne in mind that there is a wide distinction in meaning between the terms caution and cowardice. During a period of general dulness it is often a mark of wisdom for men to restrain their propensity to enterprise, and to slow down their pace to conform to that of their neighbors. "Hasten slowly" is a maxim which may commend itself to the prudent side of even the most enthusiastic natures, and periods frequently occur when real progress is best assured by a courageous slackening of the gait. But that is a wholly different thing from giving way to timidity and apprehension. We see men sometimes who, in their business affairs, seem to collapse at the contemplation of shadows of their own creation. There are men yet living in this city, poor, forgotten and incapable, who, at the outbreak of the war with the South, were prosperous merchants, but who, through apprehension of the effects of civil war upon business, sold out, and never were rich enough to buy in again after they discovered the mistake they had made. Over-caution is sometimes as fatal as over-effort, and must be as sedulously guarded against. Success in business is generally conquered in much the same manner as success in warfare. The brave, prudent man wins in the struggle, while the timidly apprehensive man is pushed to the wall. Without the possession of a reasonable amount of courage, a merchant stands on an unstable and treacherous footing, from which he is liable to be jostled and dislodged at any moment by his more confident and consequently more self-asserting associates. Of what avail are capital, or backing, or familiarity with business technicalities and detail, if their possessor is not also endowed with a stout heart ready to execute what his trained brain has conceived? If in business

competition the physical law of the "survival of the fittest" is found to obtain, it will also be found that it is because the "fittest" are, as a rule, the stoutest hearted and the most courageous. This quality is at all times essential to mercantile success, but especially is it needful, as above remarked, when trade is dull, and men's hearts, as is natural, respond to the depression in their business. That is the time for courage to assert itself, and for energy to redouble its efforts. One of the most wonderfully successful merchant princes of New York made it a rule, when his trade became slack, to greatly expand his advertising, believing that at such junctures it was needful to call every possible resource into play. It is in times of the greatest business activity and expansion that the exercise of prudence is usually most needful, to save men from going too far in the exhilaration of success; but, when opposite conditions obtain, courage is the quality which men require to keep them nerved to confront the situation. The really brave man is, in all positions in life, the one who exhibits the most real prudence.

THE ALUMINUM AGE.

This is the title of a new eight-page alleged Trade Journal, to be issued monthly at Newport, Kentucky, the first number of which has reached us. The ostensible editor is Charles L. Hartsfeld, and the largest advertiser in the paper is the Hartsfeld Furnace and Refining Co., who claim to be manufacturers of pure aluminum and aluminum alloy, and state that they have been in operation in this country since 1885. About two years ago this same concern issued a circular asking newspaper publishers to insert their advertisements, and to take their pay in stock of this same Hartsfeld Furnace and Refining Co. To inspire confidence in the value of this stock a long list of reference was given, including some of the most reliable scientific publications in this country. An application to these so-called references resulted in convincing us that the names had been used without permission, and that the statement that the proprietors of these papers had taken stock in the Hartfeld Furnace and Refining Co. was false. Commercial agency reports about Charles L. Hartsfeld were equally unsatisfactory. As there is no reason to believe that any better or more satisfactory reports could be given now, it seems to us that the *Aluminum Age*, and all connected with it, are good to leave severely alone.

VANISHING LUXURIES.

DAINTY DELICACIES DOOMED TO DISAPPEAR BEFORE IMPROVIDENT GREED.

If the present rate of extermination goes on the menus of the country will be deprived of the substance if not the names of some of their best attractions. Very few persons have eaten real canvass-back duck or real diamond-back terrapin this season, although many thousands think that they have. With a canvas-back worth almost its weight in silver and a terrapin even more precious, the bona fide article has been scarce and the names have been used to cover clever substitutes that only epicures could detect. Indeed, with the terrapin at $60 a dozen, the only way for a caterer to serve it with financial success at the average banquet is to mix with three or four diamond-backs eight or nine of the "sliders" of the far South or the cheaper varieties of other sections. This year the intermixture of varieties so as to secure a satisfactory result at a satisfactory price has become something of an art. The real canvas-back duck has appeared intermittently on bills of fare and even in Baltimore, the headquarters of modern-priced epicureanism, a dish of of it cost $4, the highest rate ever known in that city. A man who recently returned from the Chesapeake region says that it is only a matter of time when the terrapin and the canvas-back duck will be exterminated, and the circumstances fully substantiate his assertion. Fewer terrapin have been caught this year than ever before. The best come from the Chesapeake Bay, and the catchers all say that they never knew them to be so scarce. They have been hunted mercilessly, and, to add to the depletion, the eggs have been taken away by boys and men, who use them for food, Less than a century ago the slaves on an estate in Anne Arundel County, Md., revolted because they were being fed too much on terrapin. Within the memory of men now living these much-prized reptiles sold for $1 a dozen, and their steady rise to $60 a dozen, and scarce at that, illustrates their increase in gastronomic favor. The terrapin farms that were started in Maryland five years ago are still maintained, but a terrapin raised in captivity, even with the best of care, has not the value of one caught wild. It lacks the peculiar qualities which make the dish an unapproachable delight. Five years ago the estimated yield of the Chesapeake Bay was 500,000 terrapin annually. This year it is not one-fifth of that number. The disappearance of the canvas-back duck is due to two causes. It breeds in Hudson Bay and the far northern lakes of British territory. The millions of eggs that are laid along these bodies of water are no longer respected. They are collected for commercial purposes, and the annual destruction is as great as it is disgraceful. When the canvas-back leaves its Northern home it follows the edge of winter down the coast until it reaches the celery-covered flats of the upper Chesapeake Bay. The arrivals have grown less and less. At one time the birds were killed by the hundreds with mounted guns. Not many years ago 7,000 ducks were killed on the opening day of the shooting season. Until a few years ago from 2,000 to 5,000 were shot. Last Fall everybody looked forward to a big season. The previous Winter had been an open one, and and the celery beds were in excellent condition. For the first several days the shooting was fine, but the game was principally in red-heads and the cheaper varieties; there were few canvas-backs. As the season has progressed this scarcity has increased. The red-head duck has taken the canvas-back's place, and as it resembles it in taste and flavor most persons do not appreciate the difference; but the canvas-back is still unequaled, and its disappearance is a misfortune to lovers of good eating. It has permanently gone above the reach of all except the rich. The two ducks are very much alike except in the color of the bead and the bill, the red-head of course being less in price.. On one occasion Chauncey M. Depew was a guest at an elaborate dinner in Washington. The conversation turned upon the dish and the similarity was discussed. "Mr. Depew," said the hostess, who was as matter of fact as she was rich, "how can you tell the difference between the canvas-baek and the red-head?" "Very easily," responded the gentleman from New York. "The difference is in the bill." It was excellent, but fancy the ex-Granger candidates feelings when the hostess exclaimed: "Really, Mr. Depew, I did not know that they cooked the ducks with their bills on." By the next century the extermination of both the canvas-back duck and the diamond-back terrapin will be almost as complete as that of the buffalo. It will be a great loss not only to this country, but to the epicures abroad. Bismarck and Henry Irving and other notables of Europe have frequently had canvas back ducks sent to them from New York, and the demand from across the sea has increased each year. It is rather remarkable that, while organized efforts are being made to keep up the supply of fish and protect the game birds, very little is being done to check the ruin of the delicacies of the land and sea. If there is anything that ought to be plentiful and cheap, it is the oyster. Except milk there is nothing that equals it as a food, and, with the vast area of available beds along the Atlantic coast, it could be made one of the most remunerative of crops. Nature was magnificently bountiful in putting in the bays and rivers and sounds millions of bushels of these bivalves, and just because the original supply was great, the people have rested under the expensive delusion that it would always continue. When the first settlers came to the present site of New York they had 350 square miles of rich oyster beds around them. Where are they now? At one time oysters were found in abundance from Cape Cod to the Gulf of St. Lawrence. They are all gone. The Delaware Bay and the Delaware River were famous for their oysters. They are now practically barren. In the Chesapeake Bay and its rivers were the finest oyster grounds in the world. They aggregated the enormous total of 1,600,000 acres, and yielded from 15,000,000 to 20,000,000 bushels a year, besides supplying seed oysters to Long Island Sound. Of the 25,000,000 bushels of oysters eaten in this country in 1880 the Chesapeake Bay supplied 17,000,000. This season its total product has been less than 5,000,000, and next year it will not reach 3,000,000 bushels. Oysters that brought 40 cents a bushel ten years ago would be worth a dollar a bushel to-day. The advance in price within a year has been over 25 per cent., and the indications are that for next year it will be 25 or 50 per cent. more. New York, Connecticut, and Rhode Island are doing good work with their oyster-planting laws, but at best they will produce only about 2,000,000 bushels annually for the next few years, and in the twelve other States which raise oysters there are no methods of recuperation, and the dwindling of the general supply is sure to continue. The future of this supply rests mainly in the States of Maryland and Virginia, which control the Chesapeake Bay. Both States at last are becoming aroused to the importance of action and the Legislatures that will be elected next Fall will be full of the subject of oysters and oyster plans. The scarcity in the Chesapeake this year drove a lot of Maryland and Virginia dredges to the coasts of North Carolina, but the Tar Heels rose in their wrath and objected to the invasion. Gov. Fowle called out the armed forces, and the visitors were sent back home without apology or delay, whereat the North Carolinians rejoiced and adopted various resolutions thanking the Governor for his work. In Maryland and Virginia the situation is the same. Both have great industries which have been ruined by too much rapacity. Both support navies to protect the supply and pay more for expenses than they get in revenues, without doing any good. Virginia has a slipshod planting law, but it amounts to nothing, because it affords no security to planters. Maryland has a culling law which says that oysters less than two and one-half inches in size shall not be sold, but it has been ignored. The intelligent men of both States recognizes the immediate necessity of establishing a system of oyster farming in order to save the supply, but in this work they have the persistent and demagogical opposition of more than 30,000 oystermen, who declare that oyster farming means monopoly and the shutting out of poor men. There are on the Chesapeake nearly 15,000 boats engaged in the oyster trade; the capital invested reaches nearly $12,000,000; the living of thousands of men is dependent upon the catching of oysters, and they all view with alarm any action that will interrupt their work until they have dredged every oyster that they can find. They have already impoverished more than a thousand square miles of oyster beds; two-thirds of the bay is barren; this year they have made no money, and yet they have raised a clamor against every policy that will allow the growing of a new crop. They simply cannot see far enough ahead to appreciate the value of intelligent action. A convention of the Southern States on the oyster question has been suggested this year, but it will probably not be held. Maryland and Virginia, however, may get more in harmony, and as their Legislatures meet at the same time next year, they may agree on a simliar line of action. In each Legislature the oystermen will be strongly represented, for they are great on politics, and to them oysters are the Alpha and Omega of statesmanship. Their plans rival the platforms of the Farmers' Alliance in paternalism. For

instance, one of their leaders wants the State to spend a few hundred thousand dollars in replenishing the depleted beds and allow the oystermen to pay it back when they catch the oysters. Oyster farming is the ultimate hope of the intelligent men of the two States. Gen. Seth of Maryland says that with it the bay will yield the State easily $30,000,000 worth of oysters a year, and that the possibilities are $100,000,000. Prof. Brooks of Johns Hopkins University, whose studies on the oyster question have made his reports standard authorities in this country and in Europe, placed the sum at $60,000 000. This is for the million acres of oyster area in Maryland. Virginia's 600,000 acres will yield larger proportionate results because her oysters are better. The artificial cultivation of oysters is a proved success. Our old friend Pliny, in the eighty-ninth book of his natural history, tells us that Sergius Orata first conceived the idea of planting oysters in beds. It was such a great success that he built a palace near his oyster beds so that he could assemble his guests at his oyster suppers. Emperor Vitellius ate oysters four times a day and had his special brands cultivated. The Roman gourmands kept up their supplies by oyster cultivation. In France the supply was exhausted and was built up to greater proportions than it had ever known through the system of farming which has become famous throughout the world. Great Britain is finding out the necessity of the farming system. In this country Connecticut was the first State to grant vested rights in oyster lands. That was forty-five years ago, and she has to-day the best preserved and the most reliable supply in this country, and in spite of the star fish, which do $500,000 damage annually, she has this year on her 74,000 acres realized more clear profit than have Maryland and Virginia on their 1,600,000 acres. Connecticut ships about 100,000 bushels abroad every year, the destination being Liverpool and London, but occasionally Germany and Sweden. New York's oyster culture laws within the past few years have increased her area of oyster culture ten times over, and in Connecticut the increase has been from 1,100 to 11,000 acres. Less than ten years ago New York relied largely upon Baltimore for its supply, This year Baltimore sent orders to Connecticut. It is safe to say that two years from now Long Island Sound, with a total of less than 200,000 acres of oyster ground, will produce more oysters than the 2,000,000 acres of the Delaware and Chesapeake Bays. Could anything illustrate more forcibly the contrast between a system of oyster farming and the lack of it? There is not a respectable hotel nor a reputable restaurant north of the Potomac River that does not have "Blue Points" on its bill of fare. That fact shows one of the pleasant fictions of the oyster trade. Says the recent annual report of the Fish Commissioner of Connecticut: "There are now no genuine Blue Points, so called from their native growing place at Blue Point, Great South Bay, on the south shore of Long Island. They became extinct thirty to forty years ago. Oysters now known by that name are small and round instead of large, crooked, and long, and are grown anywhere on the Sound." The history of the fisheries published by the Government says: "The old 'Blue Points,' cherished by the Dutch burghers and the peak-hatted sons of the Hamptons, who toasted the King long before the Revolution was thought of, was of the large, crooked, heavy-shelled, elongated kind. Two dozen made an armful." In 1853 the value of Blue Points was $200,000 a year. But depletion soon did its fatal work, and in a few years the stock was exhausted. As it was with the Blue Points so will it be with other brands now known to fame unless there is a speedy inauguration of oyster farming. But after all a way is provided to perpetuate the bivalve, while the terrapin and the canvas-back are beyond the enterprise of man.

THE STANDARD OF LENGTH.

HOW IT IS COMPUTED AND PRESERVED.

In the United States and England the standard of length is the yard, and the question arises, How long is a yard? It may be said in answer that a yard is simply an arbitrary standard, which tradition says is based upon the length of the arm of Henry VIII. At present the yard is the distance between two marks upon a certain bar, kept in the Tower of London, and if it should be destroyed, the exact standard could never be replaced. To avoid this uncertainty, and obtain a fixed and unvarying standard, the French, in the last century, made an accurate measurement of a quadrant of the earth's circumference, and taking the ten-millionth part of this distance, gave it the name of *metre*, and adopted it as the standard of length. This length, which is equal to about 39.37 inches, is now in universal use on the continent of Europe, and is authorized as a legal standard in nearly all civilized countries. Considerable discussion has arisen as to whether the original measurement was perfectly accurate, and it seems probable that there was a small error, so that if the standard metre now kept in Paris should be destroyed, a re-measurement of the quadrant of the earth would not give us exactly the same metre. However, the error in any case is a very minute one, and the chances are very small that the original standard will ever be destroyed, to say nothing of the fact that the numerous copies distributed among the various nations of the world do not appreciably differ from it. These standard bars are cast from an alloy of platinum with ten per cent. of iridium, forming a metal almost as hard as steel, practically infusible, and not acted upon by chemical reagents. The measurements are marked upon the surface, and the peculiar shape of the bar is especially calculated to endure a strain without bending; and, in fact, a slight deflection will not materially alter the length of the face on which the scale is engraved. It has been proved that a weight of eighty pounds may be placed on one of these bars, while supported at the ends only, without permanently altering its shape. The standard of weight is the *gramme*, which is the weight of a cubic centimetre of water at 4 deg. C., its point of maximum density. Practically, the standard at Paris is a block of the platinum-iridium alloy weighing one thousand grammes, or one kilogramme. Copies of this standard of weight have also been made for the several nations comprising the International Metric Conference, and it is believed that they do not vary more than one hundred-millionth from the original—a dimension which is utterly unappreciable. A meeting of the International Conference was held at Paris last September, when the work of the committee who prepared the various standards was ratified, and the standards accepted for the respective nations. The successful completion of this work, which has been in progress for about fifteen years, marks an epoch in scientific progress, and denotes an amount of care, skill, and accuracy, on the part of those having the work in charge, which cannot be realized by any one except those directly concerned in it. The simultaneous destruction of these widely scattered standards of measure and weight is almost impossible, but even in such a remote contingency, another measurement of the earth's circumference would practically give us back our metre, with no important change from its original length.—*Pop. Science News.*

BERING, NOT BEHRING.—When the Czar Peter the Great determined to send out an exploring expedition to ascertain whether Asia and America were united by land, he selected to lead this expedition Captain Commander Ivan Ivanovich Bering. Bering was the son of Jonas Svendsen by his second wife, Anne Pedersdatter Bering, and was born at Horsens, in Jutland, in the summer of 1681. All the Russian and Danish records agree as to the spelling of the family name; both in Danish and in Russian it is Bering. His autograph is always written Bering.

CLEAN BOOKS.

SOME SIMPLE EXPEDIENTS FOR CLEANSING BOOKS.

The following methods of cleansing valuable books, may doubtless be found useful: "Grease spots, if old, may be removed from books by applying a solution of varying strength of caustic potash upon the back of the leaf. The printing, which looks somewhat faded after the removal of the spot, may be freshened up by the application of a mixture of one part of muriatic acid and twenty-five parts of water. In a case of fresh grease spots, carbonate of potash (one part to thirty parts of water), chloroform, ether, or benzine renders good service. Wax disappears if, after saturating with benzine or turpentine, it is covered with folded blotting paper and a hot flat-iron put upon it. Paraffine is removed by boiling water or hot spirits. Ink spots or rust yields to oxalic acid, in combination with hot water; chloride of gold or silver spots to a weak solution of corrosive sublimate or cyanide of potassium. Sealing wax is dissolved by hot spirits and then rubbed off with ossia sepia (Cuttle-fish bone); india ink is slightly brushed over with oil, and, after twelve hours saponified aqua ammonia, and particles of color still remaining must be removed with rubber." In this connection it may also be remarked, that if beef tallow be well rubbed into recent ink spots on linen or cotton before sending to the laundry or wash, the spots will be found to have disappeared on the return.

WHAT IS SAID ABOUT US.

"THE AMERICAN ANALYST" is a popular weekly analysis for the family and consumer of everything relating to man's physical need and comfort. For the housekeeper this publication is particularly valuable; not only does it give a thorough digest relative to the properties contained in various foods, but treats of all matters conducive to our health and comfort in time with the progress of scientific research from the pens of able scientists. It is an extremely bright and interesting publication; the various subjects are explained and discussed simply and lucidly, and in such a manner as to make them both entertaining and instructive to any reader. ANALYST PUBLISHING COMPANY, 19 Park Place, New York.—*Household Monthly.*

ELECTRICAL CREMATION.—A patent has been taken out in France for an electric furnace for the rapid incineration of human remains.

LONDON FOG.—The atmosphere of London is said to be gradually becoming more and more harmful to plant life, and it is attributed in a large measure to the thick fogs.

NEW PAPER.—The *Bacteriological World* is the title of a new medical monthly, edited by Dr. Paul Paquin, director of the bacteriological laboratory of Missouri State University.

ESTIMATED POPULATION.—The estimate of the population of the United States for the year 1900, by Hon. Carroll D. Wright, Superintendent of the Department of labor, gives as the approximate figures 76,639,854. This is the result of a careful consideration of the estimates made by several other reliable individuals, the known rates of increase, and the various circumstances that bear upon the growth of population.

THE DOG WAGS THE TAIL.—The man who observed that the large rivers generally happened to run close to the large cities has now discovered that the firms that do the largest amount of business generally happen to have the largest advertisements in the papers.—*Dansville, N. Y., Breeze.*

HUGE NUGGET.—At a recent meeting of the Geological Society, London, a model of the largest gold nugget yet found in Western Australia, known as the "Little Hero," weighing 330 oz. 8 dwt., found at Shaw's Fall, 200 miles from Roebourne and eighty from Nullagine, at a depth of eight inches, was exhibited by Mr. Harry Page Woodward, F.G.S.

MUSICAL MYSTERIES.

HOW THE PHONOGRAPH IS LOADED WITH POPULAR MELODIES.

Half a dozen men were assembled in the rear room of a house in Fifth Avenue the other afternoon examining some curious looking machines which stood on a raised counter in the centre of the room. Attached to each machine was a big brass funnel, shaped like the mouth of an exaggerated ear-trumpet. An odd little cylinder, that looked soft and greasy, revolved at moderate speed back of the point of each funnel. On the other side of the double glass doors that divided the room from a much larger one in front, three negroes and a negress were listening intently. Their heads were close up to the doors, and an expression of expectancy rested upon their faces. Presently four of the men in the room arranged themselves in front of a similar number of funnels, while the other two went in back and began to manipulate a number of belts and screws connected with the machinery. Then one of the men adjusted the funnels so that they were close together, and the smallest of the quartet, a pudgy man with a square, smooth-shaven face, stepped forward and said, in a voice so loud that it made the listening darkies jump: "The following selection is 'Annie Rooney.' It was sung on Feb. — by the ——— Quartet." Immediately the quartet began to sing in fortissimo. The darkies did not have to strain their ears to hear, but they followed the singing very closely nevertheless. They seemed to be more interested in the methods of the singers than in the result. As soon as the song was finished, the singers sat back and discussed their work. "That ought to have taken all right," said one; "but what I don't understand is the way the machinery halts every once in a while. Seems to me the battery is out of order." One of the men behind the machinery now manipulated another screw, and presently the machine repeated in queer, strained tones the song that had been poured into it. Then the quartet got up and sang another song in the same fashion, to which the darkies listened as intently. They were waiting for their turn. Every day the families who live in the houses adjoining the one in which this performance took place hear the strains of music and the sounds of highly pitched recitations, declamations, speeches and dialogues. Every day, also, a lot of people come into the office on the lower floor of this house and want to secure engagements to talk into the phonograph on the upper story. Nearly all these people are professionals. Some of them expect to be paid for their services, and others don't. Some are satisfied with the advertising they expect to get out of their singing and talking, and some merely wish to gratify their vanity. The man who has to judge of the fitness of applicants has a hard time of it occasionally. The other day he came down and said to the manager: "Those women are no use to us. They can't sing for sour grapes." Five minutes later two strong-voiced women came down the stairs in a hurry, and, waltzing into the office of the manager, wanted to know what arrangements he was prepared to make with them. They were ignorant of the decision against them. But they intimated that they did not have very much respect for the judge, anyhow. They complained of his "lack of courtesy." When they heard that he had reported that their voices were not fit to be reproduced by the phonograph, they started for the stairs leading to his office with an energy that frightened the manager partly out of his wits. By the time he had recovered his equilibrium they were going up the stairs two steps at a time. He overtook them, but found it difficult to restrain them. He tried soothing syrup for some time in vain. "It isn't because your voices are not good, correct, sweet, and all that," he said. "Of course not. I am sure your voices are very fine; in fact, your reputation is well known to me. But, as a matter of fact (letting his voice drop to a confidential whisper), voices can be too good for this purpose. A very sweet voice won't do. Patti's songs and those of other big singers didn't go well at all." All his efforts were wasted, however. The women looked at him with withering scorn. "You can't deceive us that way," said the elder of the two, vehemently. "We are no spring chickens. This whole business is a rascally proceeding. That scoundrel you have got up there is unfair and unjust. He only recommends his own tools. We would not have cared if our application had been rejected by a competent judge. Everybody has his own opinions, I presume; but the idea of being insulted into the bargain! We will sue the company for libel; that is what we will do." Then they stamped out, leaving the manager much relieved at their departure. "All sorts of people come to our office," said the manager, "and want to be allowed to sing into the phonograph. Many of them can't sing at all, and even some who are good singers do not seem to be able to use their voices effectively. We are overrun with applicants, and have lots of noted people on our list. We employ a man to do nothing else but play the piano for the vocalists. The man who tests their voices listens to the applicant while he sings a few bars, and if he thinks the voice suitable he spends considerable time in instructing its owner in the way he should sing into the phonograph. It is very difficult to do that well. Many of the applicants want to throw a cartload of pathos into their voices, or sing in a stagy tone, and strut about melodramatically, as if they were before an audience. That won't do at all The tone must be natural, and the words distinctly spoken. Articulation is a very important element in securing good results. The singer must stand still at a certain distance from the receiver, and sing loudly and clearly. Not one out of ten of the singers who appeal to the public possesses a voice suitable for the phonograph. We find it especially difficult to obtain a suitable female voice. The quality of the tone seems to be too fine and too thin. A baritone is the best voice for our purpose. Although most of our applicants volunteer to sing for nothing, just to have their names repeated by the machine, we pay a good and suitable singer well. We don't have much use for the high class operatic airs, but find that the popular songs take much better." The company keeps a book in which are written the names of all the applicants and all the persons who have sung or spoken into the phonograph. Ed. Stevens of the Casino company has been there frequently, and so have a number of other comic opera favorites. The Twenty-third Street Theatre band pours its melody into the phonograph about four times a week. Any number of trios, quartets, quintets and sextets are on the list. All the cylinders on which these songs have been recorded are labelled and put away on their proper shelves. The same song or recitation is frequently repeated on half a dozen cylinders. The latter are rented out to the owners of phonographs, or are put into the nickel-in-the-shot machines. The other day a party of young girls went down to the Edison works in Broad Street and listened to the voice of the phonograph for some time. One of the men connected with the company put up a game on the girls, and made them think that Mr. Edison himself had been aware of their coming, and had talked into the machine for their benefit. The alleged Wizard's voice expressed his gratification at the presence of so many lovely girls, and invited them all to come out to his home in Llewellyn Park. Fortunately the girls did not accept the invitation, although they were very much pleased with it. The Wizard would have probably been much surprised if he had found a bevy of girls coming up to the front door of his house some afternoon with the confident expectation of finding him ready to receive them. The apparent mystery of the phonograph still continues to draw large numbers of people, most of whom seem to regard it as one of the creations of the Old Nick himself. They listen politely while attendants explain the workings of the machine, but continue to look incredulous, nevertheless, and seem restrained only by a sense of propriety from expressing their unbelief.

CONTINGENCIES OF OLD AGE.

SPECIAL DANGERS ENCOUNTERED BY OLD PERSONS.

Old age has its special dangers and its special safety with regard to disease. For instance, whereas in a child the temperature goes up on the slightest provocation, in old age it can hardly be moved at all. The aged body is not, as a rule, prone to any acute disease. If a person passes eighty, it is rare for him to be seized with any special malady. In injuries such as fractures, though from the lightness and brittleness of the bones they are easily met with, they are repaired solidly and quickly, even in centenarians. Slight shocks cause severe depression, but greater injuries are surmounted, and surprising recoveries made from severe maladies. Wounds and ulcers often heal quicker than in the young; the aged recover from attacks of congestion, paralysis, apoplexy, pneumonia, erysipelas, and other affections in a surprising way. Diseases, as we have said, often pass them by. A man may live to be one hundred in a house in which he had typhoid fever himself, and in which many of his children and grandchildren have since died from it. It is probable these favorable results are due to the long time the organs have worked unitedly and helped each other, like old soldiers who pull well together and bear reverses under which younger troops would succumb. There is, on the other hand, a tendency in old age for slight diseases to become chronic. Now, as to the care of old age, the chief points are moderate and digestible food, sufficient warmth, and even quiet life. The chief of the three is the food, or fuel for the lamp of life. While all fixed dieting is bad, where it can possibly be avoided, a few hints can be given that may prove of value. The older a person is after fifty, the less food he requires. Luigi Cornaro, who lived to one hundred, though of a feeble constitution, took 12 ounces of solid food and 14 ounces of fluid daily during the latter part of his life; and his most severe illness was caused by his increasing his allowance, through the continual entreaties of his friends. Very little proteid or animal food is required, and though in many respects false teeth are a great boon to the aged, they may lead to too great a consumption of animal food. It is not the amount of coals we put in a grate that warms the room, but the amount that can be burnt; and the great point is to avoid choking the digestive and excretory organs with excess of food. The food of the nursery is the best in old age. Bread and milk and honey is a capital diet. Milk agrees with nearly all. Hot milk with a little Mellin's food forms an admirable drink at night, and can be kept warm in a hot water jug covered with a cosy. Fruit is wholesome if ripe or well cooked. Fat is good, as cream or fresh butter. Warm food is very suitable. Soup enriched with cream or marrow is light and nourishing. All meals should be regular, and all excesses avoided. Of 800 persons over eighty, 60 per cent. were moderate eaters, 30 per cent. small, and only 10 per cent. large. If weight is being gained, the diet should be decreased. In addition to the after-dinner nap as years creep on, a doze after breakfast and before dinner is often helpful. As to clothing, it should be both warm and light. Fur is an admirable material. The underclothing should be of wool. A sealskin waistcoat is useful, and the feet and hands should be well and warmly clothed. An eider down quilt on the bed, which should be warmed in winter, is a good covering. No aged person should be suffered to get cold in bed. Two A.M. is the hour when most deaths take place, when the temperature of the body is lowest and its powers feeblest. All habits of old people should be respected, and not lightly altered. Whatever excites exhaustion should be forbidden; early rising is therefore bad. Drinking hard water is not good, as it tends to hasten the calcareous changes in the body. Certain common errors in the care of the aged may be here pointed out; some we have already touched on. 1. That the aged require rich and very nourishing diet. 2. That early rising is good for them. 3. That cold

baths invigorate them; whereas they are fraught with imminent danger, and are often fatal. 4. That continual medicines and dinner pills are needed to digest the food; whereas, instead, less should be eaten. 5. That the rooms should be hot; whereas they should be cool, but not cold—65 degrees to 70 degrees. 6. That a fixed diet should be rigidly adhered to; whereas variety is often essential. Old age is of two sorts; that which is natural, and that which is prematurely acquired in youth; and it need hardly be observed that it is only of the former variety we now speak. Self-denial often requires to be practiced by the aged in many ways, though not arbitrarily. All known weak points in the constitution should be jealously watched. No care as a rule surrounds the aged such as guards the young, because they are not in many ways the same objects of interest. But this is not as it should be, nor is it consistent with the Christian profession. In animals, death when it comes is, as a rule, swift. There is, with the vast majority, no old age and debility suffered among them. No long wasting or disease or slow tumors embitter their lives; they are killed by their fellows when their powers fail, and are thus delivered from all these slow tortures by one sharp stroke. This apparent cruelty of nature is thus a merciful provision for those beings who know not the meaning of sympathy. In early ages and in savage life it was the same with man. The skulls found in the gravel beds are all full of teeth, as of those who died early. Now, in advanced civilization, love and care prolong life to a great age. This is not an unmixed good. Almost the very existence of slow decay and long disease has been brought about by the love and care that distiuguish humanity. Hence it is a peculiarly noble and Christian work to lessen the sufferings that in a sense our own care has made possible; and, as far as we are able, to make old age a period of serene sunshine and an unmixed blessing.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, geese.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUITS.—Apples, bananas, grapes and oranges.

PRACTICAL RECIPES.

TOMATO SOUP.—Put a beef soup-bone to boil for an hour in three quarts water, then add half a cup of rice and cook another hour, then put in half a can or one pint of fresh tomatoes, one and a half tablespoonfuls of allspice, one tablespoonful of whole cloves, and cook another hour. Strain through a colander, season with salt and pepper and serve.

STUFFED BEEFSTEAK.—Take a rump steak about an inch thick and cover it with the following mixture: chop a large onion very fine, mix with it a tablespoonful of sage and one of bread crumbs, season very highly with pepper and salt. Roll the steak up and tie it, than bake. When done serve with gravy.

RISSOLES OF KIDNEY.—Parboil four mutton kidneys, then fry them in butter, with a little minced onion, chop them very fine and season highly with pepper, salt and a little sage. Have ready some pieces of pie-crust rolled out thin, put a good spoonful of this in the centre of each piece, close them up and bake.

POUND CAKE WITH COCOANUT.—Beat one pound butter and one pound powdered sugar to a light cream, then mix in three-quarter pound desiccated cocoanut and some lemon flavoring; beat ten eggs to a froth and whip them into the cake. Work in one pound flour, in which is sifted two teaspoonfuls of baking powder, pour into buttered tins, sprinkle cocoanut over the tops and bake in a moderate oven.

ICED COCOA.—Make some cocoa, allowing one teaspoonful cocoa to a cup of milk, sweeten and flavor with vanilla; put it in the freezer and freeze it, but do not let it get as firm as ice cream. Serve in little cups set in saucers with some ice-cold whipped cream on top of each cup.

SPANISH ONIONS.—Select a large, fine Spanish onion, put it in boiling water and parboil it, remove from the fire and throw it into cold water, then dry it and scoop out the insides, and fill the cavity with equal parts of fine sausage meat and mashed potatoes mixed with the yolk of an egg; bake. Fry a piece of ham quite brown, make a good gravy, pour it around the ham on the dish, put the onion on top of the ham and serve very hot.

STALE ROLL PUDDING.—Cut some light rolls into thin slices and line a well-buttered baking dish with them. Pound one-quarter pound almonds in a mortar with a teaspoonful of powdered cinnamon, two tablespoonfuls of sugar, and the grated rind and a very little juice of a lemon. Sprinkle some of this over the rolls, then put on another layer of rolls, and then the rest of the almonds. Put little bits of butter on top. Over all pour a quart of milk in which is beaten eight eggs and sufficient sugar to sweeten. Bake in a moderate oven; turn out when done, and serve with wine sauce.

NEWSPAPER PICTURES.

HOW THE ILLUSTRATIONS OF THE DAILY PAPERS ARE MADE.

The illustration of newspapers is a new branch of art. Ever since its beginning its apprentices have been trying to find out the simplest and most effective methods for the reproductions of drawings, in order that they might be made with the greatest possible quickness, engraved on metal with the utmost attainable celerity, and printed clearly and well at the rate of twenty thousand copies per hour. To such perfection have the processes for this purpose been brought, that the turning out of pictures all ready for the lightning presses is nowadays hardly more than a matter of a few minutes' time. Most interesting of the processes employed in newspaper illustration, from the point of view of simplicity, is what may be termed the "chalk method." Take a thin bed of smooth chalk laid upon a metal surface, and draw upon it with a fine steel point any picture you may desire. The steel point will cut the lines of the picture out of the chalk to the metal, and thus you will have it in the shape of an intaglio. Make a stereotype from this intaglio, and you have your metal plate to print the picture from. Could anything be more simple? Such is the idea of the chalk process. In applying it, instead of pure chalk various mixtures are used, such as plaster of Paris, which is merely chalk in another shape, with a certain proportion of a white Carolina clay. The stuff, pulverized and stirred up with water, is spread over a rectangular sheet of polished steel, as you would spread a slice of bread with butter, to an even thickness of about one thirty-second of an inch. Now you are ready to begin operations as soon as you have baked the steel plate in an oven for a while, until the chalk layer has been rendered perfectly hard. It will hardly do for you to attempt to draw your picture directly upon the chalk, lest you make mistakes. The best way is to make your sketch on a piece of paper, and then laying it down upon the chalk surface, go over the lines with a pencil point, which will indent the paper, and leave marks beneath upon the chalk. Lift the drawing, and you find under it, in the chalk, its reproduction. Now you apply your steel point directly to the chalk, cutting all the lines of the drawing down through the chalk to the surface of the steel plate. When you finish this operation the dark steel of the plate shows through the chalk in all the lines of the sketch. And these lines are perfectly clean and sharp, thanks to the keenness of the knife-like steel point employed. All you have to do for the rest is to pour molten lead over the chalk surface in a mould and let it get cold. The lines that are cut out of chalk will be reproduced in relief upon the lead, and thus you will have your metal engraving to print the newspaper picture from, mounting it for the purpose on an iron block thick enough to make it level with the type. Though so advantageous for its simplicity, the chalk method is not so good for fine work in the way of sketches and portraits as the "zinc process," so called. The former, however, by reason of its cheapness, is most useful to provincial newspapers, which cannot afford the comparatively expensive photographic plant required by the latter. In the zinc process, to begin with, an ordinary photograph reduced to the required size is taken with a camera of the pen and ink sketch drawn on cardboard by the artist. Next a smooth plate of zinc is "flowed over" with an albumen solution that forms a sensitized skin on the surface. The glass negative of the picture is laid upon the zinc plate and the two are put together in the sunlight. What are to be the black lines of the printed drawings are, of course, white and transparent in the negative. The sunlight goes through wherever the negative is transparent, and has the effect of hardening the sensitized skin beneath, so that it clings tightly to the zinc. It requires only one minute to perform this operation. Now the zinc plate is taken and given a coating over the sensitized skin of lithographer's ink, rubbed on with a roller, after which the plate is washed. In all places where the sunlight has not struck the zinc, owing to the opacity of the glass negative, the sensitized skin readily washes off, together with the ink that covers it; elsewhere it clings. Thus, after the washing, the perfect drawing in ink remains upon the zinc plate. To make the ink lines harder the plate is brushed with powdered dragon's blood. Then it is plunged into a bath of acid, which eats away the zinc wherever it is not protected by the ink, so that when it is taken out the lines of the drawing are found all raised above the rest of the surface of the plate, like a map for the blind, and when mounted "type high" on a metal base, you have your "cut" ready to print from. Such is the zinc process. "Processes" have infinitely multiplied within the last few years—so much so, in fact, that the student of engraving is aghast at contemplating their variety. At present, however, the zinc method seems to be the most avaliable for journals of the period. At all events, it is employed by a majority of the big newspapers of the country. Considerably used for newspaper illustration is that of photo-engraving, which somewhat resembles the zinc method. A glass plate, however, is used instead of a metal one. This glass plate is covered with a thin layer of sensitized gelatine, which is permitted to dry. Then the photographic glass negative of the drawing, made with the camera, just as in the other case, is laid over the gelatine, and the glass plate and negative, with the gelatine layer between them, are put in the sun for half an hour. The light hardens the gelatine, and makes it cling to the glass plate wherever it strikes through the negative, so that when the glass plate is subsequently put into water all the rest of the gelatine comes off, leaving the drawing on the glass in gelatine lines. Moist plaster of Paris is spread over the plate next and permitted to harden. When it is taken off it is a mould of the drawing. From this mould a plaster "relief" is made, and a reproduction of metal in this relief by stereotyping is the plate to print with. These are the three methods by which newspapers produce the pictures which go so far to brighten up and help out the interest of the columns of the daily press.—*Washington Star.*

THE TRUTH ABOUT COCOAS.

Breakfast cocoas are merely cacao nibs roasted and partially deprived of their cocoa butter, thus making them more soluble and digestible. This method of preparation originated in England, but was soon taken up in the United States, France, Germany and Holland. In the United States the house of Walter Baker & Co., who have been chocolate manufacturers since 1780, were the first to take it up, and have been for many years favorably known as the makers of a favorite and pure brand of breakfast cocoa. This has been sold at the uniform price of fifty cents per pound, no doubt yielding a satisfactory profit to the manufacturers, who are counted among the wealthy firms of Massachusetts. They have always claimed that all the goods sold by them are pure and wholesome, and analyses made by different chemists have fully borne them out in these claims. The State laws of Massachusetts are very strict in regulating the sale of food products, and prohibit the sale of any impure article. The State chemists of Massachusetts have never found any cause to complain of this brand of goods, which is the strongest evidence that they are strictly pure. The reputation of this firm has always been that they made only the best goods, and their sales are increasing so rapidly that we must take it for granted that those who use them have found them satisfactory. For the year or two just passed we have beheld the curious spectacle of one or two firms from Holland advertising largely a brand of cocoa which they claim is superior to any Americans have yet known, and forsooth demand double the price heretofore paid for the American brand, which has been so far satisfactory to those who have used it. If this is anything more than an endeavor to take advantage of a suppositious snobbery of Americans, under the delusive idea that we will pay double price for a foreign article, there ought to be something about these Dutch cocoas that would show it. Careful chemical analyses of these Dutch cocoas have shown the presence of adulterations with the indigestible but weight-making cocoa shells, and the use of certain chemicals to make these Dutch cocoas more soluble, while competent judges inform us that the Dutch cocoas are not made from as choice or expensive cacao beans as our American. It is therefore not because these Dutch cocoas are any more valuable that double price is demanded for them, but must be to enable these foreign manufacturers to advertise more extensively, and thus attempt to force their inferior goods upon our market. It is well known that the retail grocers have not found it to their interest to push these foreign goods, as their experience has shown that the consumer does not like them as well, and cannot see any reason why they should pay one dollar for an inferior article while a much better article can be bought for fifty cents. The retail grocer generally keeps what his trade demands, and undisputed facts show that consumers prefer the American cocoa. A show of trade may be made for a time by consigning goods, but this will not work in the long-run. The American cocoa manufacturers have never been compelled to consign their goods. Another dodge lately resorted to is that of advertising that the demand for these foreign goods has been so extraordinary that they must stop advertising because they are unable to fill their orders and must build a new factory, requiring three years to finish it. That is the flimsiest tissue yet blazoned forth, and altogether too irrelevant to attempt to impose upon intelligent Americans. Be this as it may, however, we will here give a simple test by which every one can judge of the relative merits of these goods. Dissolve two teaspoonfuls of the two competing cocoas in two tumblers half full of water; stir and let stand forty-eight hours, then smell of each. Your nose will quickly enable you to decide whether it is best to stick to your old American friend or not.

TOMATO DISEASE.—A singular disease has recently been called to the attention of physicians. It is a form of recession of the gums of the superior molars, which is said to be due to the use of tomatoes as food.

CLEVELAND'S
SUPERIOR
Baking
Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is

THE STRONGEST

CONSUMPTION

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable*."

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

AN OLD ESTABLISHED COMPANY.

A company that has been established for more than thirty years in this city certainly has something to be proud of, and when it is said that the Great American Tea Company, of 31 and 33 Vesey Street, has been in successful operation for more than thirty years, it goes without saying that the goods they offer to the public are exactly what they are represented to be. The teas and coffees which are sold by the Great American Tea Company are now known from one end of the country to the other. If any of the readers of THE AMERICAN ANALYST have never dealt with this Company, it is suggested that a trial order be sent to them. If two dollars is enclosed to them, three and a half pounds of Oolong, Japan, fine English breakfast, or any other popular kind of tea, will be sent, and if one order is sent others are sure to follow. Address the Great American Tea Company, 31 and 33 Vesey Street, this city.

LYSOL.—Among the latest disinfectants is "lysol," which appears to be very much like carbolic acid. The emulsifying agent is resin or fat soap, tar acid being incorporated with the soap at the moment of saponification.

ELECTRIC DRUGS.—In Germany iodoform is being made by use of the electric current. An alcoholic solution of iodide of potassium traversed by a current of carbonic acid is subjected to the electric current, and iodoform is produced in the shape of small yellow capsules.

INGENIOUS CLOCK.—The chronologe of the Rev. Canon Cinquemani is an ingenious clock, and consists of a single-toothed escape wheel, which propels a pair of pallets and the pendulum. In addition to this there is a chain of lead balls, one of which is discharged over a revolving drum every quarter of an hour. These keep the escape wheel going and by another contrivance strike the hours and quarters.

ELECTRICAL POWER.—Electricity is about to be used as a motive power in a mining district of Colorado which has been handicapped heretofore by the great cost of fuel and the difficulty of getting it. There is abundant water-power in the neighborhood, but not at the places where power is wanted. It will be an easy matter, however, to use the water-power for the generation of electricity, transmit the latter by wire to any desired place within a reasonable distance, and there convert it into power. Thus, by the agency of the dynamo and with the aid of water-power mines may be devloped that could not be worked if the generation of power depended upon the transportation of coal or other fuel from distant States. This is a happy illustration of the application of inventions to particular uses. Nothing new is to be used, but the projectors have simply found a place where the combination of known machines and processes will yield them the power they require at less cost than local steam-engines.

Have You? Many Millions Have

accepted James Pyles' invitation, to try his wonderful discovery *Pyle's Pearline; for easy washing and cleaning.* You couldn't count them in a lifetime. Some of the twelve million housekeepers in this land must have accepted very often. That's the way with Pearline. The wise woman who investigates, tries it; the woman who tries it continues to use it. A daily increasing sale proves it. The truth is, there's nothing so acceptable as Pearline. Once accept its help, and you'll decline the imitations—they don't help you. It washes clothes or cleans house. It saves labor and it saves wear. It hurts nothing, but it's suited to everything. Try it when it suits you, for it will suit you when you try it.

Beware Peddlers and some unscrupulous grocers will tell you "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.* 175 JAMES PYLE, New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month**, and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions**, arranged for practical use; timely hints to **Housekeepers**; cheering and helpful talks with **Mothers**; valuable information for lovers of **Flowers**; a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, Feb. 16, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	65c @	60c @
Prime	60 @	55 @
No. 1	55 @	50 @ 55
No. 2	50 @	45 @
No. 3	40 @ 45	40 @
Shipping	40 @	— @ —
Prime Rye Straw	85 @	— @
No. 2 "	75 @	
Short "	55 @ 60	
Oat and Wheat	40 @ 45	

Fresh movements of Hay have been interfered with this week by stormy weather, so that, while receipts have been a trifle smaller, stock does not show any material decrease.

Common grades have been in greatest request, and supply is not very large.

While we quote 65c. for fancy Hay, we would say that there is very little of this quality arriving, and that it must be gilt-edged to bring the price. Receipts of Rye Straw have been in excess of the demand, and price is weaker. Stock of perpetual Hay is limited, and the better grades are in fair demand.

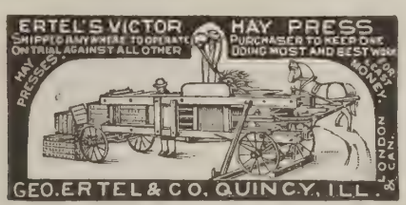
BOSTON.

COMMISSION MERCHANTS,

HAY, STRAW, FLOUR & GRAIN.



E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$13.00 to	$14.00
Hay, choice to fancy, perpetual pressed bales	12.00 to	13.00
Hay, fair to good	11.00 to	12.00
Hay, poor to ordinary	8.00 to	10.00
Hay, Clover and Clover mixed	8.00 to	10.00
Hay, swale	8.00 to	9.00
Straw, Rye, good to prime	17.00 to	17.50
Straw, Oat	9.00 to	

BOSTON, Feb. 20th, 1891.

The receipts for the week are 303 cars of Hay and 30 cars of Straw. The receipts of Hay the past week have not been quite as large as for some weeks previous, but they are still in excess of the demand. The stocks on the tracks and in the depots of the various railroads are large, and the railroads are crowding receivers to move same promptly. Market continues dull and weak. Quotations are nominal. Rye Straw and Oat Straw are dull and easier.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

BLOOD PURIFIERS.

The notion that the blood can be "purified" by the direct action of medicines is a popular fallacy, originating in ignorance, and largely sustained by the mendacious pretences of quacks and charlatans. The *Journal of Commerce*, of this city, some time since set its foot down on this absurdity in replying to a correspondent who inquired for "the best remedy for purifying the blood." Our contemporary's response was virtually as follows: Ever since the vendor of a celebrated patent medicine advertised throughout the Union, "One disease hast thou only, an impurity of the blood," for which his pills were set forth as an infallible specific, the popular mind has turned towards nostrums of some kind to relieve the vital currents of their irritating foulness. Nature has machinery of her own specially designed for this purpose. The blood vitalized by the breath goes out in the arteries a bright red color, and comparatively clear of noxious particles. It enters the veins, where it picks up a very large part of what may be called the entire waste of the system, and flowing back to the centre, it is almost black and fairly turbid with what it has gathered on this circuit. When it reaches the lungs it is poured into them to be purified. Fresh, pure air is the instrument of cleansing. The lungs exhale the foulness, and inhale new life and purity, which, coming in contact with the huge volume of the circulation, changes at once the color and character of the blood, and sends it out again with its old ruddy hue. The process is rapid, and when the air is full of oxygen, and is not itself vitiated, it is thorough. To check this movement wholly is death in a very few seconds of time. But it can be impaired by inhaling an impure atmosphere, or breathing over again the air that has been expelled from the lungs charged with carbonic acid gas, and which has no chance to recover tone by mixing with a purer current. Go into a small closet and shut the door. The atmosphere soon becomes filled with the foulness brought by the venous blood to the lungs and poured out in exhalations. In a few minutes it is stifling, and death finally ensues. What is thus done on a deathly scale is partially accomplished by sleeping in a small room where no fresh air is admitted, or by working all day in a close and ill-ventilated apartment. Nothing taken into the stomach will purify the blood. Exercise quickens the circulation, and if, while the currents are thus made more active, sufficient fresh air is supplied, the purifying process is rendered most effective. The blood may be rendered more impure by what is eaten, as it picks up the offensive matter thrown into the system after digestion. But the purification is done in the lungs, and reasonable exercise in the open air is the only solution of the problem.

SLEEPING CAR RIGHTS.

The travelling public owe a debt of gratitude to those belligerent fellow passengers who insist upon their rights, and, failing to obtain them, appeal to the courts and fight their cases through to the end. Not long ago a passenger on a Minnesota road objected to the upper berth being put down when not occupied. The railroad officials merely laughed at his objections. But he took the matter into court, and that tribunal sustained him. Now all sleeping-cars in that State are obliged to conform to this decision. Two analogous cases have just been decided in New York, which define still further the rights of passengers, and the duties of the railway companies. Mr. Charles H. Dwinelle was a passenger on the New York Central. He had purchased tickets for a section in a sleeping-car on the train. Owing to a washout the passengers were compelled to change cars. The porter conducted Mr. Dwinelle and his wife from one train to the other, and Mr. Dwinelle asked him to restore his sleeping-car ticket or make him acquainted with the conductor of the second train, so that he might not have to pay over again. At this request the porter became incensed and struck Mr. Dwinelle a blow in the face, knocking him down and rendering him unconscious. In the Trial Court and at the general term of the Supreme Court it was held that the railroad company was not responsible, but that the New York Central Sleeping-car Company, which employed the porter, was solely liable. The Court of Appeals, however, decided otherwise, holding that the porter of a sleeping-car is the servant of the railroad company in whose train the car is run, and the case was sent back for a new trial, with a direction to submit the facts to a jury, in order that they might determine whether the porter was in the performance of his duties at the time of the assault. Another case was that of Philip Carpenter *vs.* the New York, New Haven & Hartford Company. He left New York city at 10½ P.M. and immediately went to bed, placing his vest containing forty dollars, under his pillow. Upon waking in the morning the pocketbook which contained the money was still in the vest, but the money was gone, so was the person who had occupied the berth above him. Mr. Carpenter sued the company to recover the amount of his loss, but was unsuccessful in the New York City Court, as well as in the Court of Common Pleas. The second division of the Court of Appeals, however, reversed the judgment of the courts below and ordered judgment absolute in favor of the plaintiff. Chief Judge Follett held that a "corporation running sleeping-coaches, with sections separated from the aisle only by curtains, is bound to have an employee charged with the duty of carefully and continually watching the interior of the car while berths are occupied. A traveller who pays for a berth is invited, and has the right to sleep, and both parties to the contract know that he is to become powerless to defend his property from thieves, or his person from insult, and that the company is bound to use a degree of care commensurate with the danger to which passengers are exposed. Considering the compensation received for such services, and the hazards to which unguarded and sleeping travellers are exposed, this rule of diligence is not too onerous."

IS SALICYLIC ACID HARMLESS?

Experimental demonstrations have repeatedly shown that salicylic acid possesses no positive action on the system, even when employed in considerable quantities. This indifference, so far as the general system is concerned, is well recognized, and yet it would seem, from recent investigations, that salicylic acid is not altogether free from effect. Its influence is manifested in interfering more or less with the normal functions of the several juices of the body. Thus it will prevent the conversion of starch into sugar, either by diastase or by the pancreatic ferment, but is said not to seriously interfere with either peptic or pancreatic digestion of albumen. Saccharin, which in its inertness closely resembles salicylic acid, exhibits likewise a similar influence upon the action of the ferments as just described.

On the other hand, the common preservatives, sodium acid sulphite and boric acid, are said to possess no effect, whereas beta-naphthol has a positive interference with the diastasic, but none with the pancreatic formation of sugar. The latter, furthermore, prevents almost entirely the peptic and pancreatic digestion of albumenoids. The safe side, however, is to use none of these.

A RISKY IMPROVEMENT.

Smokeless powder, and the results of its use in the battles of the future, are being much discussed by military men. An enemy not concealed behind works will, there is reason to believe, be under considerable disadvantage with no smoke to cover him. Especially is this likely to be the case now that the quick-firing heavy gun has been perfected. During the tests recently made at the Colt factory at Hartford, the newly improved Driggs-Schroder rapid-fire gun sent a quick succession of eight-pound projectiles with unerring aim at a target four miles away. With the advance of cavalry not covered by the smoke of infantry fire till at least near to striking distance, the quick-fire gun is likely to do some terrible work, if not to make such cavalry advances altogether impracticable. Troops operating in the smoke of their own guns can often see across a field to the enemy while he cannot see them, as we can often see out of an enveloping fog bank which those at a distance cannot penetrate. Thus it is a serious question whether the use of smokeless powder by an enemy would not incline to his disadvantage, his adversary meantime being protected by a film of smoke.

THUMB IDENTIFICATION.

At a recent meeting of the Anthropological Institute Mr. Francis Galton, F. R. S., exhibited a large number of impressions of the bulbs of the thumb and fingers of human hands, showing the curves of the capillary ridges on the skin. These impressions are an unfailing mark of the identity of a person, since they do not vary from youth to age, and are different in different individuals. There is a statement that the Chinese—who seem to be credited with every new discovery—had used thumb impressions as proofs of identity for a long time, but Mr. Galton pronounced it to be an eggregious error. Impressions of the thumb formed, indeed, a kind of oath or signature among the Chinese, but nothing more. Sir W. J. Herschell, however, when in the Civil Service of India, introduced the practice of imprinting finger marks as a check on personation. Mr. Galton's impressions were taken from over 2,000 persons by spreading a thin film of printers' ink on a plate of glass, then pressing the thumb or finger carefully on the plate to ink the papillary ridges, and afterwards printing the latter on a sheet of white paper. Typical forms can be discerned and traced, of which the individual forms are mere varieties. Wide departures from the typical forms are very rare.

CONGRESS AND PURE FOOD.

AN UNTECHNICAL ANALYSIS OF THE PROPOSED PADDOCK BILL.

The bill known as the Paddock Pure Food bill, for preventing the adulteration and misbranding of food and drugs, is strenuously urged upon Congress by means of petitions, most of which are sent out from the petitions headquarters at Washington and returned there. There has been little discussion of this bill in the public press, and we doubt if many of the signers to the petitions in its favor, or if the Farmers' Alliance and other organizations of farmers that have approved it, know what its provisions are. It is called the Pure Food bill, and pure food is a good thing, and so the country is asked to believe that the Pure Food bill is a good thing. Mr. Paddock reported from the Senate Committee on Agriculture and Forestry on February 4, an amendment to the bill striking out all after the enacting clause and substituting the amendment. This amendment may therefore be treated as representing the ideas of the Committee on Agriculture and Forestry as to the proper measure of Government supervision of foods and drugs. It provides that the Secretary of Agriculture shall organize in the Department of Agriculture a section called the Food Section of the Chemical Division, and place it under the direction of the chief chemist, whose salary is to be increased by the sum of $1,500 a year. This officer shall from time to time procure and cause to be analyzed samples of food and drugs "sold or offered for sale in any State or Territory other than where manufactured." The Secretary of Agriculture is authorized to employ "such chemists, inspectors, clerks, laborers, and other employees as may be necessary to carry out the privisions" of the bill, and a long list of officeholders would certainly be required. The term "drug" as used in the bill, includes all medicines for internal or external use; and the term "food" includes "all articles used for food or drink by man, whether simple, mixed, or compound;" everything, in fact, from pemmican to gin fizz. The act defines at length what shall constitutes adulteration. A drug is considered adulterated:

"First, if when sold under or by a name recognized in the United States Pharmacopœia it differs from the standard of strength, quality, or purity, according to the tests laid down therein.

"Secondly, if when sold under or by a name not recognized in the United States Pharmacopœia, but which is found in some other pharmacopœia or other standard work on materia medica, it differs materially from the standard of strength, quality, or purity, according to the tests laid down in said work.

"Thirdly, if its strength or purity fall below the professed standard under which it is sold."

Under the first definition a druggist or drug manufacturer might be punished for selling a drug which was not only not adulterated, but was even of better quality than the standard. Everybody knows, on the other hand, that it is impossible to maintain exact perfection and purity in every specimen of every article in stock; and is it just to punish a man because a single article falls slightly below the professed standard of strength or purity, if it is still not injurious to health? If the Government has any call to take upon itself the supervision of drugs, adulteration injurious to the public health is the only kind of adulteration about which it can find any reasonable reason for concerning itself. All other adulteration is out of its province. Yet in the case of drugs, and, as will be seen, still more notably in the case of food, the so-called Pure Food bill proposes to interfere with private business for the sake of protecting purchasers against fraud. Here are the definitions of adulteration of food and drink:

"First, if any substance or substances has or have been knowingly mixed or packed with it so as to reduce or lower or injuriously affect its quality or strength, so that such product, when offered for sale, shall be calculated and shall tend to deceive.

"Secondly, if any inferior substance or substances has or have been substituted wholly or in part for the article, so that the product, when sold, shall tend to deceive the purchaser.

"Thirdly, if any valuable constituent of the article has been knowingly wholly or in part abstracted, so that the product, when sold, shall tend to deceive the purchaser.

"Fourthly, if it be an imitation of and sold under the specific name of another article.

"Fifthly, if it be mixed, colored, powdered or stained in a manner whereby damage is concealed, so that such product, when sold, shall tend to deceive.

"Sixthly, if it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of the person consuming it.

"Seventhly, if it consists of the whole or any part of a diseased, filthy, decomposed or putrid animal or vegetable substance, or any portion of an animal unfit for food, whether manufactured or not, or if it is the product of a diseased animal, or of an animal that has died otherwise than by slaughter."

Of the seven, only a part of the first and the sixth and the seventh define such adulteration as it can possibly be the business of the Government to exercise its police power upon. Mere deceit is injurious to the morals of the deceiver, but it is the province of the Sunday-school, not of the United States Government, to discourage it. Deceit sounding in damages can be attended by the courts already. It is never desirable to create new offences unless it is absolutely necessary. The whole subject of the inspection and supervision of food and drugs can safely be left to the police power of the States. There is no necessity for calling in the power of the general Government over inter-State commerce; and as an attempt at Government regulation of the matter the so-called Pure Food bill is absurd. Now for the pains and penalties:

"The introduction into any State or Territory from any other State or Territory or foreign country of any article of food or drugs which is adulterated within the meaning of this act, is hereby prohibited; and any person who shall ship or deliver for shipment from any State or Territory or foreign country to any other State or Territory, or who shall receive in any State or Territory from any other State or Territory or foreign country, or who, having so received, shall deliver, for pay or otherwise, or offer to deliver to any other person any such article so adulterated within the meaning of this act, shall be guilty of a misdemeanor, and for such offence be fined not exceeding two hundred dollars for the first offence, and for each subsequent offence not exceeding three hundred dollars, or be imprisoned not exceeding one year, or both, in the discretion of the court."

Every person who manufactures, sells, or exposes for sale any drug or article of food included in the provisions of the act must furnish samples of them for analysis to any person duly authorized by the Food Section who may apply to him for that purpose. Each sample is to be divided into three parts, and each part sealed with the seal of the Food Section. One part is to be left with the manufacturer or dealer, one with the Food Section, and one deposited with the United States Attorney of the district. It will be seen that in case this provision should become law, a building of about the size of the Equitable Building in this town will have to be built in each of the big cities to furnish storage for the District Attorney's food and drug samples. The manufacturer or dealer may have his own sample analyzed at his own expense, and if his chemist's analysis differs from the Food Section chemist's analysis, a third chemist, appointed by the President of the Association of Official Agricultural Chemists of the United States, shall analyze the District Attorney's sample in the presence of the other two chemists, and the whole evidence shall be laid before the court. This will be very pleasant for analyzing chemists, and the account for their expenses will be a long one. The railroad fares alone will make a very pretty sum. Anybody who refuses to comply with these provisions for the analysis of samples "shall be guilty of a misdemeanor, and upon conviction shall be fined not exceeding $100 nor less than $10, or imprisoned not exceeding one hundred nor less than thirty days, or both." And anybody convicted of manufacturing, offering for sale, or selling an adulterated article of food or drug, in addition to the penalties already mentioned, shall have to pay all the necessary costs and expenses of inspecting and analyzing the adulterated articles. The makers of the bill seem to have admitted to themselves vaguely that it might be a little severe to fine and imprison dealers who may be entirely ignorant of the adulteration of their wares. How, indeed, is a small dealer to know whether the food products or drugs he has bought of larger dealers are pure or not unless he employs a chemist? And chemists are not common in the rural districts. The bill graciously provides that, "in prosecutions for violation of this act, proof of the act done shall be held to imply knowledge and intent on the part of the accused, *unless such knowledge and intent shall be disproved on the trial.*" That is, a man shall be presumed to be guilty unless he can show the contrary. Persons with old-fashioned notions of law will be inclined to object to this. The chief chemist shall publish in bulletins

the results of the analyses of specimens of food and drugs examined under the direction of the Secretary of Agriculture, "but the names of manufacturers or venders of such foods or drugs analyzed shall in no case be published in such bulletins until after conviction in the courts of violations of this act." The opportunity which this provision, and, indeed, the whole act, gives to malicious persons to injure the business of their enemies or rivals is obvious. No dealer or manufacturer of foods or drugs could feel himself safe from private malice or the extortions of the agents of the Department of Agriculture. Blackmailing would be inevitable, for the opportunities for it would be too great not to tempt cupidity. Spies would be the jackals of the blackmailers, and a monstrous, corrupt, and inefficient system would be foisted upon the people. Instead of protecting the health of its citizens, the Government would interfere, often wantonly, in their business, and the country would soon pray to be protected from its protectors. It would be impossible that such a law should not result in dishonesty, but the officious meddling would be even worse. The United States District Attorneys will have their hands full if the Food Section is established. It is their duty to begin proceedings upon report from the Secretary of Agriculture, or at least to satisfy themselves whether such proceedings can be maintained. A good working knowledge of analytic chemistry will have to be added to the necessary qualifications of these officials, and they will find that of all expert testimony that of analyzing chemists is not the least contradictory.

AFRICAN CURRENCY.

ALMOST EVERYTHING USED FOR MONEY IN THE DARK CONTINENT.

One of the greatest difficulties that the British and German colonization societies, as well as all travellers in Africa, have to contend with, says the Chicago *Herald*, is to be always provided with money for the transaction of business with the natives. The difficulty more especially referred to means the right kind of money. There is not one object on earth which would pass as a medium of exchange throughout the length and breadth of Africa; and, as in matters of money, the black skinned sons of Africa are just as particular as people of other climes, one of the first things necessary to make Africa a good field for civilization, and for mercantile enterprise, is to create and enforce a common monetary standard. One great obstacle is the fact that the population of Africa is split up into numberless tribes and tribelets, each one of which, in almost every instance, has a medium of exchange of its own, and recognizes no other in its dealings with strangers. And these mediums run up and down the scale in hundreds of gradations, beginning with the Austrian dollar, bearing the effigy and imprint of Maria Theresa, the empress, and ending with methodically flattened dogs. Of all coined money the Maria Theresa dollar has by far the largest circulation in Africa. Its territory extends from Fez in Morocco down to that "London of the Soudan," the great trade emporium, Kano, and thus comprises more than one-third of the whole of Africa, about 4,000,000 square miles, with a population of 70,000,000. But even in this coin there are differences. In Kassala, for instance, no Maria Theresa dollar is taken at its full value unless it bears the date 1780, the bust portrait of the empress, the crown adorned with seven well-defined apples, the decorations on her breast, and the letters S. F. near the rim. Of other metals which are used in coinage in civilized lands copper is used to quite an extent in Africa; the cannibalistic Niam-Niam especially, like the English bar copper of one inch diameter. Expeditions to the territory of the Niam-Niam, therefore, have generally been forced to include several coppersmiths, and these men, as soon as the Niam-Niam land was reached, industriously applied themselves to transforming the bars of copper into rings of sizes varying from that of a bracelet to that of a tiny finger-ring. And so great is the love of the Niam-Niam for these baubles that even one of the small copper finger-rings (value less than a cent) would purchase a fat chicken of them. Iron, too, is made use of in this way among the Africans. As it goes into trade in stick form, there were up to recently such expressions as "a stick of rum"—meaning the equivalent of a stick of iron in rum—generally about a gallon; "a stick of tobacco," equivalent to twenty rolls of the weed, quite common in central parts of Africa. At the mouth of the Niger, for instance, in Bomey, the iron is wrought into horseshoe-like form and then called igbi or manilla. Another form is given to this iron money in the territory watered by the tributaries of the White Nile. The Bongo people have an iron currency having the shape of a spade, with a handle and an anchor-like end to it. This they call loggo colluti. The largest iron coins circulating here are of the size and shape of a large plate, being one foot in diameter. These treasures are piled up in the warerooms of native merchants just as silver or gold bars in other lands. For ten iron plates of two pounds weight each the love-lorn Bongo swain buys his inamorata of her papa. When he can't get ten of such iron plates he has to be satisfied with an elderly beauty. Besides metals, salt is a medium of exchange in Africa. This is especially the case in Abyssinia and in certain districts in Northern Africa. The blocks of salt called amote come from the East of the Abyssinian Alps. They have the shape of a grindstone, with one end pointed, and weigh originally about one and a quarter pounds. A camel may carry 500, a mule 250, a donkey 200, and a slave 60 of these chunks. For a Maria Theresa dollar the Afar gives 100 of these pieces of salt, the people of Adoas only 40, those of Gaudar but 30. To prevent the amole from losing its weight by frequent handling it is put on the market in a wrapper of tree-bark. The Kissama people, or the Koanza in Angola, make use of their salt in a similar way, weaving rattan around it. There is also a kind of paper money in circulation in Africa. On the coast of Loango, for instance, they have um bougo, a sort of paper mat, one square foot large, of which one hundred are worth a piece of cloth in Kano. In the interior of the Soudan the tobe, a cotton cloth, and in Kanem a cotton shirt is the regular standard money. On the other hand, in Dikoa, in Ademouah, in Loggone, and elsewhere, small cotton strips are the regular currency. In Bagirari these strips are so small that from seventy to one hundred and fifty of them would have to be pieced together to make a shirt. In Darfoor the gray, coarse shirting circulates as money, and in Tiout, in upper Egypt, this material is dyed dark or blue and then cut into pieces of three yards in length. Glass beads are also much in vogue as money, but in them taste differs, and changes so continually among the different tribes that their value as a standard money is materially decreased. More than once has an African explorer suddenly found himself in a territory where the beads he had brought along would no longer pass muster with the native belles since they had recently taken a liking to another kind of bead; and the only way to make them take his beads in payment for provisions was by allowing a generous discount on their previously ascertained value. In the Southwestern districts of Africa large red beads, either of oval or of cylindrical form, are still the favorites, also small beads of indigo hue, small black ones, and others with red dots. An extensive field is covered by the kaori currency, those tiny shells of porcelain appearance and of lively hue which are found in enormous quantities in the Maldivian group of islands. The color is white and yellow or brown. This little shell measures from two-thirds to one and two-third inches in length, and is shipped either to London first or direct to Africa. A ton of these kaoris costs in Ceylon from $350 to $375. These little shells have been in African trade for many centuries. The Arab trader, Ibu Batuta, noticed them along the Niger in the fourteenth century. The first Portuguese mariners likewise passed them among the natives all along the coast of West Africa. Originally, probably, these kaori shells obtained their popularity in Africa because of their easy adaptation for purposes of personal decoration. Their value, however, has steadily depreciated.

HEADACHE.

HOW TO CURE IT WITH HOT WATER AND A SPONGE.

In case of the ordinary nervous headache from which women suffer so much, says an authority, remove the dress waist, knot the hair high up on the head, out of the way, and, while leaning over the basin, place a sponge soaked in hot water, as hot as can be borne, on the back of the neck. Repeat this many times, also applying the sponge behind the ears, and, if the assertion of the writer is not a mistaken one, in many cases the strained muscles and nerves that have caused so much misery will be felt to relax and smooth themselves out deliciously, and very frequently the pain promptly vanishes in consequence. Every woman knows the aching face and neck generally brought home from a hard day's shopping, or from a long round of calls and afternoon teas. She regards with intense dissatisfaction the heavy lines drawn around her eyes and mouth by the long strain on the facial muscles, and when she must carry that worn countenance to some dinner party or evening's amusement, it robs her of all the pleasure to be had in it. Cosmetics are not the cure, nor bromides, or the many nerve sedatives to be had at the drug shop. Here, again, the sponge and hot water is advised by the writer quoted, bathing the face in water as hot as can possibly be borne; apply the sponge over and over again to the temples, throat, and behind the ears, where most of the nerves and muscles of the head centre, and then bathe the face in water running cold from the faucet. Color and smoothness of outline come back to the face, an astonishing freshness and comfort is the result, and if a nap of ten minutes can follow every trace of fatigue will vanish.

COST OF HEATING WATER.—Water is one of the hardest of all substances to heat. This furnishes a good illustration of the law of the conservation and transformation of forces. To raise one pound of water one degree in a minute is required a heat which, if applied to an engine, would raise 772 pounds of water or any other substance one foot high. To raise eighty-six pounds one degree in a minute would be equivalent to raising eighty-six times 772 pounds to the height of one foot in a minute.—*Washington Post.*

WHAT HORSES DIE OF.—A New York horse life insurance company, insuring only sound and generally young animals, worth between $100 and $400 each, reports that, of 704 horses dying within the past five years, 183 died of colic, 77 of inflammation of the bowels, 74 of kidney trouble, 51 of pneumonia, 52 of sunstroke, 30 of pinkeye, 37 of lockjaw, 23 of broken legs, 12 of epizootic, 10 of heart disease, 4 of blind staggers, 9 killed by runaways, 4 were drowned, 2 were killed by lightning, 128 died of unknown diseases, and only 8 were burned.

HOME OF INFLUENZA.—Professor Tessier, of the medical faculty of Lyons, has returned from Russia, whither he was sent last March to take evidence upon the course of influenza there, and the various conditions of its evolution. He found, according to the *Medical Record*, that influenza is a growth of Russian soil, and, when not a raging malady, is a smouldering one. The way the people live in winter, locked up in heated houses; the flatness of the soil, its consequent bad drainage, and universally sodden condition when the April thaw begins; the filthiness of the farm yards, the village streets, and the rivers, which become suddenly swollen, and on falling leave a putrid mud behind—all conduce to make influenza endemic. Its microbe is, in fact, to be found in this mud. Dr. Tessier calls it a strepto bacillus. What is peculiar in this disease is the alliance with this bacillus of pneumococcus, which also lives in Russian marshes, river mud, and village pools.

OPALS.

THEIR PLENTIFUL OCCURRENCE IN THE STATE OF WASHINGTON.

A discovery of opals has recently been made near Moscow, in the State of Washington, close to the Idaho line. A number of the gems have been brought to this city and cut, showing a more brilliant play of colors than those obtained from Mexico. They are whiter and without the yellowish tinge of the Mexican gems. Some of them appear to be harlequin opals, on which the patches of color are made angular and variously tinted but evenly distributed. Others show deep green flashes of color, like those called lechosos by the Mexicans. One, a very large specimen, has been examined by a very skilful lapidary, and other competent parties, who are of opinion that it was the largest and most valuable precious opal in the rough that has been brought to this city. The recent find was made in a wheat-field where men were digging a well, and at a depth of four feet they came upon this deposit. Specimens have been shown to us by Melville Attwood, of this city. Specimens of basalt wacke, the enclosing rock or matrix of the opal, came with the gems. Mr. Attwood has prepared a section of the matrix for microscopic examination, by which he identified the substance. No special work has been done on the claim this winter, owing to the snow, so that the extent of the deposit is unknown. Some of the gems are quite large and pure ; and, in fact, all of them are of very good quality and quite handsome, excelling in beauty and lustre those from Mexico. Most of the opals come from Hungary, Honduras, Mexico, and Queensland. Those from Hungary are the finest and most valuable. The Honduras mines are little worked, and the opals seldom reach the market. The opals of Mexico are well known throughout the world, although they do not rank in value or durability with those from Hungary. It is not generally known that there are several places in the United States where opals have been found, most of them, however, small, colorless, and of little value as gems. Mr. G. F. Kunz, gem expert of Tiffany & Co., New York, in his recently published work on "Gems and Precious Stones," speaks of opal showing a brilliant play of rainbow colors, either of the noble or fine opal variety, having been observed in the United States only, near John Day River, Crook County, Oregon. The specimen found there is transparent, grayish-white in color, with red, green and yellow flames. The play of colors equals in beauty any Mexican material, and it is the first opal found in the United States that exhibits color. Mr. Kunz says that this strikingly resembles and has the absorptive properties of tabasheer, the variety of opal which is formed in the joints of bamboo, and which is used in India for medicinal purposes. "Undoubtedly," he says, "better material of the same kind exists where this is found." A beautiful fire opal without any opalescence occurs in a small vein about one-fourth inch thick and two inches square from Washington County, Ga. Common opal in small masses of greenish and yellowish white color, with vitreous lustre, are found at Cornwall, Pa., also at Aguas Calientes, Gibson Gulch, Idaho Springs, Colorado, of a brownish color. Professor William P. Blake, in his catalogue of California minerals (1866), wrote of a rich white variety of opal found at Mokelumne Hill, Calaveras County, Cal., and on Stockton Hill, Chile gulch, opals vere found in a thin stratum of red gravel at a depth of 345 feet. These stones were thought to have a market value, but really had none. A milky white variety similar to these and without fire is found thirty miles south of Mount Diablo, Contra Costa County, also in the foot-hills of the Sierra at the Four Creeks. Nothing, however, with the opalescent lustre and fire of these Washington opals has, as far as we are informed, been found before in the United States. As to the extent of the deposit, that is yet to be determined. Opal is a native amorphous hydrated silica, the same mineral as quartz with the addition of six or seven per cent. of water. It is never found in a crystallized form, occurring in masses having a conchoidal fracture. It has a vitreous lustre, sometimes inclining to resinous or pearly, and white, green, yellow-brown or gray color, according to the foreign substances present. Hardness 5.5–6.5 ; specific gravity, 1.9–2.3. The varieties of opal are distinguished according to their color and other physical properties. Precious or noble opal, like the Washington, is generally white or colorless, and exhibits a rich play of colors—green, red, blue and yellow, of various shades. When large, and exhibiting its iridescence in perfection, it is a very valuable gem. Fire opal is a transparent opal colored hyacinth, red to honey and wine yellow by ferric oxide ; occurs at Zimapan, in Mexico. The common opal is of various colors, but without iridescence. The formation of opals is due to the solubility of amorphous silica in water, especially in hot water, containing carbonic acid, the silica being dissolved out by spring waters from decomposed silicates and deposited under favorable circumstances in a state more or less approaching to purity.—*Min. and Sci. Press.*

PURITY AND IMPOSITION.

A SENSIBLE STATEMENT OF THE RIGHT OF CONGRESS TO INTERFERE WITH HONEST MANUFACTURES.

We receive almost every day, says the *Journal of Commerce*, from some indignant correspondent an appeal for our help in "putting a stop to these constant attacks in and out of Congress upon important home industries." Most of these communications are anonymous, but one just at hand, containing the quotation we have given above, was duly signed by a prominent capitalist. He confesses that he is interested in the manufacture of certain compounds against the sale of which so much legislation has been invited or directed, and he cannot see why the articles thus put upon the market are the object of such persistent hostility. They are innocuous, he claims, employ a large capital and an immense force of laborers, and meet a felt want in the community. He cannot see why the articles compounded with oleomargarine and cotton-seed oil should be singled out for hostile legislation. These are the product of vast industries, he asserts, and add hundreds of millions annually to the wealth of the country besides supplying remunerative employment to a large body of workmen who might otherwise be standing idle in the market-place with no one to hire them. Here are healthy articles, not imported, but produced or manufactured at home, and eminently adapted to popular use ; why should their manufacture or sale be hindered or hampered at every turn at the envious demand of other industries that are thrown into the shade by the prosperity of these newly discovered products? The tone of all these complaints is the same, and they are founded on a common error. It is not the manufacture or even the sale of the articles in question that engages the attention of the law-makers or those who demand such legislation. Every cotton seed extracted by the gin may be pressed in the mill, and the rich oleaginous stream be refined, treated with chemicals to take away its natural flavor and odor, and then be barrelled or bottled, labelled and sold to as many as care to indulge in that luxury. We never heard any one who objected to an industry thus conducted. In like manner the product of beef fat, or the fat of other animals, may be "plunged in a water bath" "melted by means of an artificial digestion," treated with two per cent. of "gastric juice made with half a stomach of a pig or sheep well washed," purified with "thirty grains of biphosphate of lime," then duly crystallized, and after much more manipulation of this sort, according to the Mege patent, may be sold as animal fat, or even as oleomargarine, by the gallon or pound. We never knew of any opposition to a labor or trade of that sort. But when cotton-seed oil, brought to the right color, is put into a bright glass bottle, duly sealed with perfumed wax, and this is half covered with an exquisitely wrought label setting forth in classic French that it is virgin salad-oil from the olive garden of Hopestein & Rufengalls, near Bordeaux, in France, and is warranted pure, and free from everything but the product of the olive fruit, we think the housekeeper who is deluded by these tokens into its purchase for consumption at his table has a right to be indignant. We collected numerous samples of "salad-oil" thus labelled and warranted pure, as the product of the olive, in sunny Italy or southern France, sold at the leading groceries in this city, and found that some of them had not a drop of olive-oil in them, and the best were adulterated from 40 to 60 per cent. with the oleaginous product of the cotton seed. In the same way when this oil is compounded with other substances and sold as "fine family lard," those who purchase it for home consumption, supposing it to be the unadulterated product of the hog, have a right to protest, and to say hard words concerning the deception. We do not wonder that they call upon the law to protect them from such an imposition. It makes no difference with our estimate of the matter that the article containing such a mixture is declared to be better for home use and more desirable for export than pure hog's lard. We believe in letting every tub stand upon its own bottom, and in calling things by their right names. A man has no business to put ground bark in with his pepper on the assumption that it is far healthier than that sharp spice for general consumption, even if he believes that to be true. The only honest way is to give the purchaser the option. The traveller was right when he asked his hostess at the inn to bring the hairs in on one plate and the butter on another, upon the ground that when he ate that compound he liked to do the mixing himself. To take oleomargarine made of the fat of animals, and churn it with cream or cow's milk to give it the flavor of genuine butter, and after duly coloring it to sell it as the product of the dairy, is a cheat, and everybody dealing in it must be aware of this fact. No one wants to stop the sale or use of oleomargarine if its consumption can be confined to those who know what they are eating ; but the producers know very well that not a thousand pounds of all the many tons that are sold are eaten by those who know the true character of the product. The first and even the second purchaser may know more or less of its constituent elements, but the lips that take it in would instantly reject it if they knew what was passing them. All the clamor about ruining a desirable industry, and placing the ban of the government on a healthful article of food, is a false pretence from beginning to end. We do not believe that Congress has any right to meddle with the subject, but we think every dealer who knowingly sells a pound of this mixture should be visited with a penalty. If he believes it to be a healthful and desirable article of food, and one the consumers are ready to purchase, let him call it by its true name and sell it for what it is, and see how many will buy it. And if the hotel-keeper or the boarding house proprietor who buys it with a knowledge of its true character believes that his guests and patrons would as lief have it as the product of the dairy, let him offer it to them by its true title and test their willingness to eat it. Split peas, duly roasted, may be healthier than the coffee bean, and ground chicory may be a capital addition to the steaming Rio or Mocha, but the only honest way is to sell the articles separate, and let the consumers mix them if they so desire. Or, if they must be ground together to produce the proper effect let the fact be stated on every package. No one wishes to denounce the business of roasting split peas, or of sweetening chicory with licorice and offering it in the market. Cotton-seed oil may be sold as such without offence to all who will buy it, and grease may be "digested" with pigs' stomachs, and offered by its real name as a substitute for butter. The fraud is in the disguise. And this is swindling of the basest kind, for it imposes on the victim's stomach, and thus tampers

with the essentials of his being. This is the age of adulterations, but there will be a reaction from it all some day, and the dealer who sells an article with a false label, or by a misrepresentation of its true character, will come to be regarded as a criminal for whom no punishment is too severe.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish, trout.

VEGETABLES. — Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress.

FRUITS.—Apples, bananas, oranges.

PRACTICAL RECIPES.

EGG SOUP.—Boil four eggs for twenty minutes, let them cool, open them, and grate the yolks, and chop the whites. Put two tablespoonfuls of butter and two tablespoonfuls of flour in a saucepan, and stir over the fire until they are thoroughly incorporated; then add one quart each of hot water and milk. Season with pepper, salt and a little nutmeg; add the whites and serve.

FISH WITH CHEESE.—Cut up together a few mushrooms, some parsley and a small onion, and fry them in butter; season highly with salt and pepper. Butter a baking dish and put the fried vegetables on the bottom; then put in a layer of cold cooked flounder or any other fish with large flaky meat. Sprinkle bread crumbs on top, moisten with stock and bake. Serve slices of lemon with this dish.

LARDED LIVER.—Lard a calf's liver with slices of fat bacon. Prepare some vinegar as follows: Take sufficient vinegar to cover the meat, and add thereto a slice of onion, some sage, pepper and salt. Put the liver in this and let it lie for twenty-four hours; then take from the vinegar and roast it, with a little water in the pan. Baste often and serve with brown gravy.

FRIED ONIONS AND POTATOES.—Put two large tablespoonfuls of butter over the fire, and when very hot add two small sliced onions; sprinkle with salt and put a cover over them; when they have cooked ten minutes put in six good-sized potatoes that have been peeled and cut into dice. Stir all together, then add salt and pepper; cover the pan again and let them cook until brown on the bottom, shaking the pan occasionally, but not mixing the potatoes and onions.

CHOCOLATE CUP CUSTARD.—To a quart of milk add the beaten yolks of five or six eggs and two heaping tablespoonfuls of chocolate, vanilla, sugar to taste, and a very little salt. Melt the chocolate in a little hot milk before adding to the other ingredients. Fill cups with this, and set them in a pan of water to bake; they will need about fifteen minutes. Serve cold.

COCOANUT CAKES.—One cup powdered sugar, two cupfuls desiccated cocoanut, two tablespoonfuls flour, whites of two eggs. Mix well, roll into a sheet, cut into small cakes, and bake a light brown.

OYSTER ROLLS.—Boil two dozen oysters for a few moments in their own liquor, take from the fire, remove the tough part and mince the rest; strain the liquor, return it to the fire, and make it quite thick with flour and butter blended together; add to this two spoonfuls of cream and a dash of powdered mace. Now add the oysters and take from the fire. Roll out some paste very thin, cut it into little squares, put a spoonful of the oyster on each, fold up the corners, brush with the yolk of an egg, and bake.

WOMEN'S WORK.

THE RELATION OF HOUSEHOLD WORK TO HEALTH.

She was a woman of mild and inoffensive appearance. It did not seem possible that she could hurt a fly. For years she and her husband had labored to earn a home. Now it was half paid for. The faithful wife had risen early in the morning to get her "man's" breakfast; religiously washed, dressed and spanked the children. She had kept the house neat and tidy, and had sat up until late at night to repair many an unfortunate rent, and "piece out" many an unpiecable garment. Her life had seemed a hard, toilsome one, but the hope of a home free from debt spurred her on. At last the blow came! Her lord and master came home and announced that he had joined a strike, and would work no longer for a shop that did not employ "union" labor. Then it was that the little woman arose in her might. "John Henry," said she, "for seven years I have worked sixteen hours a day for board and lodging, with a new dress once a year. You have worked eight hours a day, and partly paid for our home, and had plenty of cigars and beer. You strike; I strike too. Either you go to work in the morning or I'll go home to my mother." John Henry was thunderstruck. A woman strike! Why, it's preposterous! But here was the cold fact; John Henry faced it, succumbed to fate, and went to work. But, my gentle reader, suppose the women were all to strike, what would become of us? We give it up. In order that, like the good Sunday-school books, our story may have a moral, I will say something about "women's work and women's health." It is a popular saying that a perfectly sound woman is a rarity. So it would seem. But, why is this so? In the first place, women dress unhealthfully. They constrict the waist too much. A perfectly healthy woman ought to breathe as deeply as a man. Can most women do it? We think not. They rest the weight of the clothes upon the hips; they wear thin shoes with paper soles, and often have cold feet, with a congestion of blood about the trunk. We like to see pretty feet; but we really wonder how many lives pretty feet cost in these United States! What of woman's household work? In the first place, it is monotonous work. No man would ever endure it. So little change of scene or faces, with day after day the same endless toil, with the same apparently barren results. Most women become invalids, not so much from overwork as from nerve tire. We hear a great deal about the poor workingman nowadays; but who thinks of the workingman's wife? Then, too, think of the farmer's wife, and, above all, of her environment. We once examined a poor woman for lunacy. As we entered the house, and found a miserable rag carpet upon the floor, and upon the dingy walls, besides the usual chromo of some cheerful death-bed scene, we noticed the picture of a cemetery, with an unhappy individual under a weeping willow, shedding tears over a dismal tombstone. Near this was framed a memorial, in a black border, of some dear departed. A framed marriage certificate made the collection very appropriate and complete. That woman's solitary diversion was saving pennies and attending the country prayer meeting. We dined with them. Our bill of fare consisted of some tough, stringy, boiled beef, some soggy boiled potatoes, a heavy dark material called bread, and some celluloid pie. With such surroundings—a bad family history—living on innutritious, ill-cooked food, could any woman help becoming insane? We think not. How shall we prevent the ill effects of women's work? 1. By intermittent periods of rest. Every woman should provide herself with a lounge, upon which she can throw herself at intervals during the day, and permit no amount of prospective work to interfere with her daily rest. 2. Women need exercise. Even after a hard day's work, let her take a long walk in the open air. Women need more variety in their work. The introduction of lawn tennis as a popular game will produce a generation of stronger women. For healthy women, horseback riding is unsurpassed as an exercise. Dancing, in moderation, is likewise excellent. Rowing is an admirable stimulant of the circulation, and, strange as it may seem, the homely art of sweeping is not to be despised. When you take a walk, have an object. Take up the long neglected study of botany, geology, or photography. Have some charitable work, and don't watch your little aches and pains. 3. Dress sensibly. Your husband will agree with me that you never look so sweet and lovable as when you wear your tea-gown. You don't need to appear slovenly. The most artistic dress is that which shows the true shape of the human form, without exaggeration or distortion, and is far more healthful.—*Health Record.*

INTERIOR OF THE EARTH.

WHAT IS TO HAPPEN AT SOME REMOTE FUTURE DATE.

One of the most interesting questions relating to the earth, considered as a planet, is that of its interior constitution. Observations made in deep mines and borings indicate that the temperature increases as we go downward at the average rate of 1 deg. Fahr. for every fifty-five feet of descent, so that if this rate of increase continued the temperature at the depth of a mile would be more than 100 deg. higher than at the surface, and, at the depth of forty miles, would be so high that everything, including the metals, would be in a fluid condition. This view of the condition of the earth's interior has been adopted by many, who hold that the crust of the earth on which we dwell is like a shell surrounding the molten interior. But calculations based upon the tidal effects that the attraction of the sun and moon would have upon a globe with a liquid interior have led Sir William Thomson and others to assert that such a condition is impossible, and that the interior of the earth must be solid and exceedingly rigid to its very centre. To the objections that the phenomena of volcanoes contradict the assumption of a solid interior, it is replied that unquestionably the heat is very great deep beneath the surface, and that reservoirs of molten rock exist under volcanic districts, but that taking the earth's interior as a whole the pressure is so great that the tendency to liquefaction caused by the heat is overbalanced thereby. The whole question, however, is yet an open one. According to the nebular hypothesis, which assumes that the bodies of the solar system once existed in a nebulous form, and by gradual condensation and loss of heat have attained their present condition, it is probable that the earth is still slowly cooling off, and that, as we see it, it represents an intermediate stage between the hot vaporous globe of a planet like Jupiter and the cold and barren moon. If we accept this theory—and it is yearly gaining strength—then the habitable period in the earth's career appears to be but one chapter in its varied history. When it was yet molten and vaporous it could not support life, but it shed light like a star. Now it possesses a cool and solid crust on which innumerable tribes and species of animal and vegetable life swarm and flourish. Anon it will become cold and inert, its waters and its atmosphere retreating into its interior, and with them the life that depends upon their presence will disappear. This possible cause of the cessation of the life-supporting energies of the earth, it will be observed, is independent of the withdrawal of the light and heat of the sun, an ultimate catastrophe to which we have heretofore referred.—*Prof. Garret P. Serviss, in the Chautauquan for February.*

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

Descriptive pamphlet free.

Caution:—Be sure the word "Horsford's" is *printed* on the label. All others are spurious. Never sold in bulk.

ADVICE TO TRAVELLERS.

At this season of the year, when so many people are making preparations to leave home and seek amusement, study or health in other lands and climes, a few suggestions as to physical welfare may be of high value. In nearly every instance change of air and scenery increases the appetite and decreases the secretions. This is exceptionally true of ocean travel. The business man or woman of family who eats two moderate meals a day at home, takes five on a great steamer, and even then goes to bed feeling hungry. This physiologic phase of travel is of great benefit in nearly all cases. It makes the thin grow stout, the weak strong, the anæmic full-blooded, and the nervous and overworked calm and sound. But, on the other hand, what with the direction of all the bodily energies toward the assimilation of food, and the creation of new blood and of fresh tissues, there is a marked decrease in the action of the pores, kidneys, liver and bowels. The skin becomes clogged and discolored, the bladder acts irregularly, a bad taste appears in the mouth, and constipation, one of the greatest of physical evils, becomes the rule and not the exception. Unless care is taken by the traveller, bad results are bound to occur. It may take the form of some special disease, such as fever, dysentery or boils, or of a general trouble like malaria or nervous prostration. In either event harm is done, and frequently so much that the long-contemplated tour or trip becomes a positive detriment to the traveller. It is in this manner that many places have undeservedly gained the ill-repute of being unhealthful. It is a simple enough matter to prevent these ills; in fact, it is far easier to prevent than to cure. The first thing is to keep the pores open and the skin active. For this nothing can take the place of the warm bath. Cold bathing is good in its way, but it cannot do the good which warm does. The best is the Turkish, Russian or vapor bath. Next to these is the familiar bath-tub of home with the water at 90 deg. Fahr. If soap is used, employ a neutral toilet-soap, and never one of those alkaline horrors

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the

United States Government, 1889,
Canadian Government, 1889,

Ohio Food Commission, 1887,

prove that Cleveland's is

THE STRONGEST

of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

25 CTS PISO'S CURE FOR CURES WHERE ALL ELSE FAILS. Best Cough Syrup. Tastes good. Use in time. Sold by druggists. CONSUMPTION 25 CTS.

SCOTT'S EMULSION

OF **PURE COD LIVER OIL** WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.

Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

with which hotel keepers are wont to supply their guests. A good rubbing, not so much with a towel as with the hand, should never be neglected. For the internal organs, Ayer's Sarsaparilla should be taken regularly. Its tonic influence upon the liver and kidneys cannot be overestimated. By acting upon the former it purifies the blood, brightens the complexion, and keeps the mouth clean and sweet. By acting upon the latter it prevents colds and congestion, removes the unhealthful substances which are the result of careless eating or drinking, and stops those threatening brick-dust or cloudy deposits in the urine which are so often the harbingers of disease. For constipation use Ayer's Cathartic Pills. They are mild in character, and do not produce griping or pain. Avoid salts, powerful cathartics, and mercurial purges. These give temporary relief, but eventually produce a chronic constipation worse than that for whose cure they were originally employed. The best rule when travelling is to take Ayer's Sarsaparilla twice a day, and when the system is at all alkaline, to eat fruit at the meals. Ayer's Cathartic Pills should be employed about once a week under normal circumstances. In cases of long-seated constipation they should be taken more frequently. Each person in this respect must be a law unto himself. By keeping these suggestions in mind, and acting in accordance, any one can make a tour of the world without losing a minute from illness, and even without having felt that lassitude which is too often the precursor of more serious ailments.

THE WORLD'S RAILWAYS.—The United States has a mile of railway for each 400 of population and each 22 miles of area, while the balance of the world has a mile for each 7,500 of population and 227 miles of area.

SENSIBLE.—When you read that some woman managed a real estate or other business and looked after a home and seven children at the same time, personally performing all the duties in each place, don't believe it. There is some one else at one end of the line or the other.

POWER OF A TAPER.—It is said that a burning taper uncovered for a single instant, during which it does not lose power amounting to one-thousandth of a grain, would fill with light a sphere four miles in diameter so as to be visible from every part of the compass.

UNIMPORTANT, IF TRUE.—The Old Testament has 39 books, 929 chapters, 23,214 verses, 592,439 words, and 2,728,800 letters. The New Testament has 27 books, 260 chapters, 7,959 verses, 181,253 words, and 838,380 letters. The complete Bible has 66 books, 1,189 chapters, 31,173 verses, 773,693 words, and 3,567,180 letters.

BALLOON SCIENCE.—It has been proposed to make the upper half of war balloons of very thin steel and the lower portion of ordinary balloon material, the whole so constructed as to hold hydrogen instead of ordinary gas.

PAPER DOORS.—Doors made of paper are said to be an improvement over those made of wood. They are formed of two thick paper boards, stamped and moulded into panels, and glued together with glue and potash, and then rolled through heavy rollers. They are covered with a water-proof and fire-proof coating, painted and varnished.

STORAGE BATTERIES.—When electricity is employed to charge a storage battery, only that part which is transformed into chemical energy is used. The rest is dissipated. The battery, then, instead of being a place where electricity is laid away, is a place where chemicals are left by the current with the expectation that they will in turn produce a current when called upon.

SCIENTIFIC SWINDLERS.—A short time since Council Bluffs was beautifully worked by two primary-storage-$10-light-of-the-world-battery fakirs. Some prominent business men got stock and stuck, and the fakirs got $500 and arrested. Westward the course of battery fiends takes its way, and some day they will strike the coast and get dumped overboard into the Pacific.—*Electrical Review.*

SOAPSTONE FOR BUILDINGS.—In China soapstone is largely used in preserving structures built of sandstone and other stones liable to crumble from the effect of the atmosphere; and the covering with powdered soapstone in the form of paint on some of the obelisks in that country, composed of stone liable to atmospheric deterioration, has been the means of preserving them intact for hundreds of years.

BLACK POLISH ON BRASS.—To make a dead-black polish on brass, for microscopes, etc., mix one ounce of nitrate of silver in a dish with 20 ounces of distilled water. In another dish mix one ounce of nitrate of copper with twenty ounces of distilled water. Mix the two solutions together, dip the brass in the liquid, remove the brass, and heat in an oven until the desired degree of black is obtained.

AUSTRALIAN MICA.—Deposits of mica have been discovered in the northern part of South Australia, and a shipment of about one ton has been made to Port Adelaide. The sizes are extraordinary, running up to 24 inches by 12 inches, and averaging 12 inches by 9 inches. One piece was 32 inches by 10 inches, but had to be cut into two pieces. The value of mica sheets of this size in London is about 15s. per pound.

EXCEEDINGLY FINE.—The body of every spider contains 4 little masses pierced with a multitude of holes, imperceptible to the naked eye, each hole permitting the passage of a single thread; all the threads, to the number of 1,000 to each mass, join together when they come out and make the single thread with which the spider spins its web, so that what we call a spider's thread consists of more than 4,000 threads united.

IS THIS TRUE.—*Good Health* has made an analysis of a cigarette. The tobacco was found to be strongly impregnated with opium, while the wrapper, which was warranted to be rice-paper, was proved to be the most ordinary quality of paper whitened with arsenic. The two poisons combined were present in sufficient quantities to create in the smoker a habit of using opium without his being aware of it, his craving for which can only be satisfied by an incessant consumption of cigarettes.

CRUSHED STEEL.—Crushed steel is said to be coming into use for cutting stone. It is made by quenching very high carbon steel in cold water from an excessively high temperature, such as would overheat steel for most purposes. This renders it not only hard, but rather brittle, so that it is possible to pulverize it. It is crushed in a stamp mill, and sifted closely to size. It is said to be not only cheaper, but much more effective than emery, giving a better polish and quicker, and lasting much longer.

SNOW DESTROYER.—Edison says that by next winter he will have perfected an electric reflector which will melt snow as it falls. As he resides in the heart of the great American blizzard belt and has been snowed under a good part of the winter, it is not surprising that his inventive mind has been turned in this direction. A snow destroyer will meet a want that is severely felt every winter by both New Jersey and New York, and among the inhabitants of those States his reflector will do more for his fame than all his other great inventions together.

FINGERS AND FORKS.—The proverb, "Fingers were made before forks," whose origin is inquired for by a correspondent, is of very ancient date. Forks were used for some purposes in the early centuries, and as far back as the twelfth century were made at first to hold fruit while it was sliced, and to help the dishes at the table. About 1300 they were used in Italy to convey food to the mouth, but not until 1530 was this fashion adopted in England. Even knives were not, as a rule, served to guests on common occasions, and every person was expected to furnish his own. Up to four centuries ago, in ordinary fare, each person at table used his own knife (brought or carried in his pocket) for cutting his food, and conveyed it to his mouth with his fingers. When forks were sometimes used by the gentry in England, say as late as 1650, it was still far more common to use the fingers, and if any one brought a fork with him to the table and made a little display with its use, it was quite usual for the remainder of the company to employ the bare hand, with the remark, "Fingers were made before forks."

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, March 2, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	60c @ 65c	55c @ 60c
No. 1	55 @	50 @
No. 2	50 @	45 @
No. 3 and Shipping	40 @ 45	40 @ 45
Clover Mixed	45 @ 50	45 @ 50
Clover	40 @	40 @
Long Rye Straw	80 @ 85	— @
No. 2 "	60 @	
Oat Straw	45 @ 50	
Wheat Straw	40 @ 45	

Receipts week ending Feb. 28, as follows:

Via N. Y. Central	128 cars.
" West Shore	100 "
Other roads by Lighter, 34th Street	55 "
Total	283 cars.

There has been considerable falling off in the receipts, owing to the inability of the railroads to move goods in consequence of the floods along the various lines.

Stocks show some decrease and prices have advanced a trifle on the better grades, but are unchanged on the poorer qualities. This morning arrivals are heavy, being Hay that has accumulated along the road for the last few days.

Rye straw continues in large supply, and there is no improvement in prices.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$13.00 to $14.00
Hay, choice to fancy, perpetual pressed bales	12.00 to 13.00
Hay, fair to good	11.00 to 12.00
Hay, poor to ordinary	8.00 to 10.00
Hay, Clover and Clover mixed	8.00 to 10.00
Hay, swale	8.00 to 9.00
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	9.00 to

BOSTON, March. 2d, 1891.

The receipts for the week are 238 cars of Hay and 42 cars of Straw. Corresponding week last year, 302 cars of Hay and 21 cars of straw. The receipts of Hay are lighter than for a long time, but there are still large amounts of Hay here on tracks and in the depots of the various railroads unsold. Market is still in buyer's favor; there being no improvement to note either in demand or prices. Quotations are nominal. Receipts of straw are in excess of demand; market is weak.

GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens, in Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

CITY GOVERNMENT.

Some very useful points in relation to the government of American cities, and consequently of value to every American citizen, were suggested in a recent lecture by the eminent economist, George Gunton, President of the N. Y. Institute of Social Economics. Among other things, the speaker emphasized the fact that cities are not only centres of population, but they are also the centres of manufactures, trade, hygiene, improvement, and social development. Men must accept them, not as necessary evils, but as necessary to progress. The census showed that the large cities were growing much faster than the smaller ones, and the time was coming when cities would govern State and Nation. Both had practically been governed by the farmer vote, but that was practically gone, which was not a matter to be regretted, for with the advance of time the farmer's vote could not be expected to be the most intelligent. Hitherto attempts to deal with cities had begun by decrying their officials, and that last year the citizens' movement was founded on the demand that the City Government should be conducted on a business basis. This meant that the power should be placed in responsible persons. That was what the city had been trying to do for twenty years, he said. There was once a movement to place the power in the hands of property owners, but it was defeated because it tended towards despotism and aristocracy. Later the power of the Aldermen was restricted, and the absolute power of making appointments was intrusted to the Mayor. The result was that Tammany Hall, whose power it was sought to crush, concentrated its strength upon the election of the Mayor, traded votes for him, elected him, and captured the appointing power. Tammany won because all that side of the city that was cut off and neglected was under its control. The remedy was with the people, and if they wanted better officials they must first get better voters. It was impossible to eliminate politics from city government in this country, and it was not eliminated in English cities. Politicians here were not much more corrupt than they were in England, where votes were bought up even by the Liberal Party at the rate of half a crown for a man and 18d. for a woman, for women there voted in municipal elections. It was true that English cities were better kept, but they were old, and had been improved by the aristocracy, who took a pride in their cities. Our cities were new, and were occupied by a heterogeneous population. But great progress has been made even here.

ANOTHER ARCTIC EXPEDITION.

An officer of the American Navy is about to undertake a new expedition into the still unknown regions about the North Pole. His name is R. E. Peary, and he holds the position in the service of civil engineer, with the rank of lieutenant. The Government, however, does not back the expedition, but the expenses will be defrayed by geographical and scientific societies which have been interested in Engineer Peary's scheme. That officer has asked the Navy Department for leave of a year and a half, and in his letter of application sets forth at length his plan for the expedition. He does not go so far as to assert his ability to reach the North Pole, but believes that he can reach a point farther north than that attained by Lockwood, of the Greely expedition. Lockwood journeyed by the Greenland coast, and went as far north as 83 degrees and 22 minutes before turning back. Mr. Peary, who is an enthusiast on this subject, proposes to go through Greenland. The party will leave here next May, going to Whale Sound on the western coast of Greenland. For this purpose a whaler will be used. From Whale Sound the party will strike out in a northwesterly direction across Greenland, utilizing sledges in travel and transportation. Mr. Peary believes that progress by this means will be practically unmolested. The party will at least avoid the dangers of Arctic seas with moving ice fields and bergs. The explorer intends to reach in that way the extreme northern limit of Greenland coast. If the sea is frozen he will continue his sledge journey towards the pole. The theory is that the sea will be found sufficiently frozen to permit travel as through Greenland. Mr. Peary expects to return to Whale Sound by the end of the whaling season of 1892, in time to meet a whaler on which the party can return to the United States. If Mr. Peary does not reach the pole, and only succeeds in going through Greenland, his expedition will not be without a result. The interior of Greenland is unknown and the results of the Peary expedition will be new material. Mr. Peary has had some experience in that country; he has made observations a short distance from the coast line, and on them he bases his scheme for the present expedition. He will go equipped with astronomical instruments and apparatus for scientific observation, and his party will be composed of men recommended for the task by their hardihood and mental fitness. It is confidently expected that observations will be easily obtained on an overland route, and the outlook for results is better than that of the hazardous sea journeys toward the pole.

OUR PRODUCTION OF PRECIOUS METALS.

According to the report of the Director of the Mint, just published for 1890, the gold product of the United States in that year was $32,845,000, an increase of $45,000 over the product of the preceding year. The silver product of our own mines approximated 54,500,000 ounces, corresponding at the average price of silver during the year to $57,225,000 and at the coming value of silver to $70,464,645, against a product of 50,000,000 fine ounces of the commercial value of $46,750 000 and coining value of $64,464,464 in the preceding year, nn increase of 4,500,000 fine ounces in the silver product of the United States last year. The silver product of our smelters and refineries was 64,920,927 fine ounces. The total value of the gold deposited at the mints during the calendar year was $56,217,105, of which $31,234,342 was domestic bullion, $4,352,422 foreign gold bullion, $8,857,447 foreign gold coin, $558,386 light weight domestic gold coins, $3,762,364 old jewelry, plate, etc., and $7,449,141 redeposits. The total amount of silver offered for sale to the Government during the year was 68,130,457 fine ounces, and the amount purchased 37,594,373.75 fine ounces, costing $39 991,840, the average cost being $1.06 per fine ounce. The coinage executed during the last calendar year was the largest in the history of the mint service, aggregating 124,025,365 pieces, of the value of $61,054,882.84. as follows: Gold, $20,467,182; silver dollars, $38,043,004; subsidiary silver coins, $1,159,904; minor coins, $1,384 792. In addition to the coinage, gold and silver bars were manufactured to the value of $38,593.198, of which $29.498,606 was gold and $9,094,592 silver. Gold bars were exchanged for gold coin, principally at the Assay Office at New York, of the value of $23,636,865. There was a marked improvement in the price of silver during the

past calendar year, the price reaching the highest point in twelve years. The fluctuations covered a range of 26 per cent.—a wider range by far than in any previous year. At the commencement of the year silver was quoted at 98 cents per fine ounce. It reached $1.21 on August 19, and closed on December 31 at $1.04½. The average price during the year was: In London, $1.04.6; in New York, $1.05. At the lowest price reached during the year the value of the silver contained in the silver dollar was 74.8 cents; at the highest price, 92.6 cents. The average price was 80.9 cents. The amount of precious metals used in the arts in the United States during the calendar year was: Gold, $18,105,901; silver, $9,231,178. The metallic stock of the United States was approximately on January 1, 1891: Gold, $704,597,128; silver, $486,545,076. Total, $1,191,142,204. Owing to the brief time since the close of the last calendar year, the statistics of the produce of gold and silver in the world by producing countries for the calendar year 1890 are not complete. Complete returns, however, have been received from Russia, Australasia, South Africa, British India, Venezuela, and a few other countries, based upon which the Director estimates, as a mere approximation, that the gold product of the world for the calendar year 1890 was $118,490,000, a falling off of $3,007,000 from 1889; and that the silver product of the world was 130,650,000 fine ounces, an increase of $7,859,375 fine ounces over 1889. The report is replete with valuable statistics on the production, coinage and movement of the precious metals throughout the world.

AMERICAN CONTRASTS.

ANTICIPATED COMMERCIAL INTERCHANGES BETWEEN NORTH AND SOUTH AMERICA.

The principle of "reciprocity" which, when broached a year or so ago, was denounced by a certain class of politicians as antagonistic to a protective tariff, is described, as to its effects upon our South American commerce, by a Washington correspondent in the following graphic manner: Forty-five millions of people south of the Gulf of Mexico and the Rio Grande produce no breadstuffs. Wheat cannot be profitably grown in South America outside of Chile and the Argentine Republic, because the climate is not suited to its cultivation. Thus it comes about that ordinary bread is regarded there as the greatest and rarest of luxuries, so that the prudent housewife, at the conclusion of a repast, locks up the bread in the cupboard and leaves the wine on the table. The heavy import duties imposed by the South American countries upon wheat and other breadstuffs make bread so costly that only the wealthier classes can afford to eat it. It is the same way with codfish, imported from New England, which, under the name of "bacaloa," is esteemed as great a luxury as is terrapin here. At a recent State dinner given to the diplomatic corps by the president of Guatemala, codfish was made to compose five of the nine courses, cooked in as many different ways. Supplies of this delicacy, which retails at sixty cents a pound, are brought, dried and salted, from Boston. Butter is as rare a luxury in South America as bread. The sort one pays thirty cents a pound for here sells there for $1 a pound. For every pound of this commodity manufactured in that part of the world 1,000 pounds are imported from abroad. Again it is the climate that is at fault. There are cows, plenty of them, and the milk has the usual amount of cream; but the cream will not rise. Besides, there are no conveniences for refrigeration, such as cool spring houses, etc. All these things will suddenly be made cheap for the people of South America when the reciprocity treaties have been signed, as has just been done with Brazil. They will no longer be compelled to pay seventy cents a pound for hams and a corresponding price for bacon, as hitherto. For they cannot raise hogs, for lack of corn to feed them with, and anyway these animals do not seem to thrive in warm climates. South of Mason and Dixon's line in this country they present a degenerated type, the unwieldy and corpulent porker of the North being transformed into the "razor-back." These and other agricultural products the South American republics will buy from the United States, admitting them duty free, so that an enormous and most profitable market will at once be opened to the farmers of this country. The same market will also be thrown open to all our manufactured goods, such as cotton goods, leather goods of all sorts (from shoes to trunks), hardware, glassware, cutlery, and particularly machinery. They are not manufacturing peoples, and they will always be obliged to import all such things. These nations, which have been transformed into republics by a series of revolutions, were originally colonies of Spain, and are at this day peopled by most highly civilized Spaniards, by descent, who speak the tongue of their mother country. Brazil, a Portuguese colony, is the exception. However, the same may be said of the Portuguese as of the Spaniard, that he has no notion whatever of mechanics. The Latin American never invented anything worth mentioning. If he breaks a machine, he doesn't know how to mend it. All the machinists, mechanical engineers and mechanics of all sorts in South America are imported from abroad. For some reason, which only an anthropologist can attempt an explanation of, warm climates do not produce inventors. Furthermore, they do not seem to give birth to go-ahead, creative people. Whatever is done to help the advancement of the South American republics is the work of foreigners. This very reciprocity business, which is to be of such enormous benefit to these republics, is being engineered by men of enterprise from other lands, who, like Mendonca, have assumed large property interests in Brazil, the Argentine, Chile and elsewhere. If the foreigners, including those from the United States, were all withdrawn from South America to-morrow, there would be a general revolution within twenty-four hours. The people, notwithstanding their civilization, equal in most respects and superior in some to our own, do not know how to take care of themselves or to achieve progress. Nothing does the Latin American originate; almost never does he so much as write a book. Brazil estimates its loss of revenue by the removal of duties on imports from the United States, according to the treaty just signed, at $5,000,000 yearly. The other republics will lose proportionately when they come into the agreement. But they are willing to make the sacrifice for the sake of finding an open market in this country, tariff removed, for their coffees sugar, rubber, cochineal, woods, chocolate and cinchona. The taking off of duties on these commodities brought from South America at our ports will give the greatest possible encouragement to planters, and all their agricultural industries will be enormously stimulated. Coffee is the great product of that part of the world, though rubber, gathered all over it save in Chile and the Argentine, perhaps equals it in value. The sugar of Brazil stands with these two. For the quality of its fleeces the Argentine is celebrated, as well as for the hard and beautiful woods so useful for veneering purposes, which are not to be found anywhere else in the world except in Central America. All these things ought to become much cheaper for us before long. The guava jelly so prized as a luxury in this country is less esteemed in South America than the preserved fruits imported from the United States, which are regarded as dainties fit for the gods. They are so costly, however, that only the rich can afford to indulge in them. Many things which are considered luxuries here are despised by them, because they are so common. They do not eat bananas, save occasionally fried, but feed them to the hogs. More delicate fruits they have which they prefer, as we should, if they would stand a voyage and keep. For example, there is the "sepote," as it is called, the flavor of which precisely resembles baked custard. Frozen in an ice-chest, it tastes exactly like frozen custard. Another fruit is the aguacate, which tastes like nothing else in the world that can be called to mind, but resembles in appearance a small muskmelon as big as a beet. For eating, it is cut in two, after which the seeds are taken out, and it is gobbled like cantaloupe. There are many others equally strange and delicious. In South America no bread is ever made in a private house, for the reason that stoves have been unknown there until within two or three years. Recently an enterprising Yankee has been carrying them by the shipload from the United States, and they are selling rapidly in Brazil and the Argentine. All the bread is baked by big companies, which call themselves by the most extraordinary names. One company's establishment is the "Bakery of the Holy Spirit;" another bears the sign, "Bakery of the Poor Devil;" still another is called the "Bakery of Jesus Christ." All this entirely in a spirit of reverence, be it understood. The bread is supplied to families in small cakes, somewhat like breakfast rolls, which are carried in baskets on men's heads. People buy as many as they happen to want, at about five cents apiece. There is no such thing as a loaf of bread, unless it is made by special order, in which case it will cost fifty cents or more. To supply the interior districts with bread, the cakes are carried in quantities on muleback hundreds of miles. When they reach their destinations they are exceedingly stale, as well as dear, but the well-to-do folks buy them and steam them, regarding them even thus as the greatest of delicacies. Corn can be grown to some extent in the highlands, and this is used as a substitute. The lower classes generally employ for the same purpose beans and the manioca yam, from which what is called "tapioca" is obtained. Biscuits and crackers of all sorts will be greatly in demand by South America. Every effort to grow wheat there, outside of the Argentine and Chile, has been ineffectual. Some has been cultivated on the high plateaus of the north, but the crops were scarce sufficient to feed the hands that harvested them. Venezuela, in order to compel the cultivation of the grain, put a prohibitory duty on imports of it, while Guatemala, with a similar object, offered large bounties to wheat farmers. But all trials proved that the climate and soil of the tropical zones are not suited to the product. Over large areas of South America the agriculturist is confronted by a very curious and paradoxical problem. The soil is so excessively fruitful that he finds it difficult, if not impossible, to get his living out of it. He cannot keep down the luxuriant natural vegetation, in order to replace it with cultivated and valuable plants. Grass of Brobdingnagian growth springs up faster than he can cut it down or pull it up, while vines rivalling in rapidity of development that which bore Jonah's famous gourd overwhelm his crops, and weeds of all sorts array themselves in competition with whatever he tries to raise. But, with the progressive improvement in agricultural machinery and appliances, there is destined soon to arrive a time when this wonderful southland, subdued by the plough, will be the most productive region on the earth. The gold and diamond mines of Brazil are the richest in the world; but the gold mines remain almost wholly undeveloped, owing to lack of transportation facilities and of machinery to work them. Some notion of their richness may be obtained from the experience of a Portuguese company which, in the year 1831, turned a river in the province of Goyaz out of its course by building large dams. Only one day's work was done in getting out sand from the river bed after the stream was turned off, for the same evening the dams broke, and the water, resuming its old course, drowned three hundred slaves and entirely destroyed the results of a twelvemonth's labor. But the sand dug out on that day yielded thousands of gold bricks, which paid several times over for the entire investment that had been made in the enterprise. This district is now owned by capitalists in the United States, and before long it is intended to turn that river once more and delve for its store of yellow wealth. The Moro Velh in Brazil is

considered the richest gold mine known. The Portuguese opened it three hundred years ago; it was reopened seventy-five years ago by an English company, and its workings now extend three miles under ground. Unlike other gold mines, its product is continuous and never failing. The finest gold lace in the world is made in Ecuador, of native metal. There is no very extensive market for it, and it is sold chiefly to rich people, who make presents of it to friends at home and abroad. There are no diamonds now produced equal to those of Brazil, which is a country just about the size of the United States. They are usually perfectly white, and none of them have the yellow hue which so greatly diminishes the market value of the South African stones. The diamond producing formation is peculiar. Very valuable gems have often been found lying exposed on the plain, while others have been discovered so imbedded in rock that it was necessary to chisel them out. Great companies work the mines, and fresh ones are being continually opened. It is quite certain that only some of the deposits have been struck as yet. The wild Indians in the province of Goyaz, six hundred miles from the sea, constantly bring down fine diamonds from the mountains for the purpose of selling them. Pockets in the beds of the streams, which have formed natural receptacles for detritus, often yield diamonds as a reward for patient scooping. Some of the finest diamonds in the world were found in Brazil—notably, one called the "Star of the South," now being cut at Amsterdam, which is way ahead of the Kohinoor. At a recent state dinner given by the Brazilian minister for foreign affairs, the host stated, in response to a toast, that South Americans were Yankees too, as could be proven by the fact that, whereas the national dish of the United States was pork and beans, the national dish of all the southern republics was beef and beans. The beef they use for this purpose is "jerked," the process being to cut the animal into strips, which are dried with salt. If you want to buy a pound, half a yard is cut off for you by the butcher. This, with baked beans, is indeed the national dish of South America. The usefulness of this plan of reciprocity, both to the United States and the South American republics, is expressed when the fact is stated that everything we make is something they want, and vice versa.

ELECTRIC SERVICE.

ELECTRICITY'S INGENIOUS CONTRIBUTIONS TO HUMAN COMFORT.

How far can the new illuminant, electricity, aid us in hours of work and conduce to the comfort and peace of our hours of rest and recreation? The engineers have supplied the current to the house, and it becomes necessary to consider how to arrange, clothe and decorate the lamps, so that the light may be a source of pleasure and not of irritation. So far the artists have not kept pace with the engineers, and most of the pendants and electroliers found at present are wanting singularly in imagination and grace. They are far too heavy and clumsy for the light lamps that they support. The lines and curves are conventional and ungraceful, and the lamps are often so placed that they shed their light directly in our eyes, instead of reflecting it from the objects that should be illuminated by them. The shape of the lamps themselves should be considered and worked into the design, so that the whole may be harmonious, a quality in which the present models are deficient, electric lamps generally appearing as if they had been stuck or hung on as an afterthought. So far designers of electric light fittings are too much the slaves of precedent, derived from their experiences with gas, candles, oil, torches, and other relics of the past, forgetting that the shapes of the holders of all these lights are determined by the necessity of leaving a clear space above them for the escape of hot and foul air, and also by the condition that they must be within reach of the taper or match used for lighting them. Not till they realize fully their freedom from these two limitations will designers begin to appreciate the artistic possibilities of the new illuminant, and give us original designs of flying figures, birds and carved Cupids, delicate chain work, faintly tinted glass, and china powdered with flowers. Bright centre lights foreshorten distances, and enhance the feeling of narrowness, which cleverly arranged lamps, placed so as to brighten the sides and corners, should help to dissipate. Modern heavy brass models of dragons, griffins and dolphins are to be especially recommended as electric lamp holders, as good and inexpensive designs are to be bought, but they should always be fixed with the lights hanging downward, not crawling up the wall, like poor overladen insects carrying luminous eggs. Very highly ornamented fittings will often have a common appearance. Grace, simplicity, and beauty of form and color should be sought before everything. Each of the decorative lights should have a separate switch, to be used when required. Outside the drawing-room door is a beautiful place for a decorative light. The vestibule light need not always be kept burning. It should be turned on by the servant who answers the door, or connected after dark with the front-door bell, so that when the bell is rung the light would be switched on. An electric cigar lighter should hang near the front door, which will save the daily hunt for matches and consequent irritation of the master of the house and his friends Electricity may also afford us protection at night, as an ingenious burglar alarm has been devised by which, from a controlling switch in the master's bedroom, the whole passage, hall and stairs can be illuminated, so that, when the "gentle burglar comes a-burglaring" light may be shed on his nefarious practices. We owe to electricity the banishment of that faint and sickly odor of paraffine that haunts our staircases after the daily procession of the lamps to the drawing-room. In the sitting-room in which we live there should be two kinds of lights—a faint, shaded light to read, talk or think by, and a brighter light to "play by." With a bright light meditation will not be fertile, and with a dim light play will not be vigorous. It is difficult to decide beforehand exactly where we wish to have the standards and reading lamps placed. If real luxury and comfort is desired, a pair of electric wires should be placed along the skirting board round each of the sitting-rooms, and sockets should be fixed upon them at intervals, so that any standard can be moved to any part of the room, and to facilitate this all the plugs and sockets in the house should be interchangeable. It is impossible to over-estimate the daily comfort gained by having electric lamps fixed in all the principal cupboards, linen and housemaids' closets, wine and coal cellars, bath-rooms, etc. The working cost of these is not worth considering, owing to the short total of hours that each burns in the year. It is very easy to economize when first the installation is put in, but it is a great mistake to do so, as the initial expense is small in comparison to the daily comfort of well-arranged and well-distributed lights, and eventually economy in the quantity of electricity used — which, it must be remembered, is paid for by meter—will result from thus being able to light the particular corner of the room in which we wish to sit, instead of illuminating the whole room from the centre or walls on every occasion. In the drawing room, I believe that whatever the illuminant used, the light of the future will be a reflected light. The room should be flooded with a warm, soft radiance, and we should be unconscious of the source from which it proceeds; this can only be obtained by the use of reflected light, but when it is remembered that powerful electric lamps can be placed within a few inches of the most beautifully decorated ceilings without risk of injury to them, and their direct rays intercepted by silk, or any other semi-opaque substance, it will be seen at once what opportunities electricity affords for the effective illumination of our drawing rooms. It makes it possible to use decorations on the ceilings which any combustion light would destroy. If chandelier lighting is adopted, Venetian glass with different colored silk shades of the exact tints of the glass itself are effective. With cut-glass chandeliers the shades should not be all alike, but should be in different tones of the same color. If there is a window guarded by heavy curtains that seem to need relief, a large ornamental glass bowl, vase, or bottle can be hung with the lamp inside it. Wonderfully little light is absorbed by these glasses, if carefully chosen, and the rays will look like the imprisoned genie of the Arabian Nights, and will delight the imagination as well as the eye. Electrical firms have had to be patient for many a weary day, while the public were making up their minds whether to adopt the light or not; and now it is the turn of the public to be patient, for the demand at present is greater than the skilled supply. A pendant should not hang in front of a lady's looking glass, as she will see only the reflection of the lamp instead of her own hair. A pendant should hang on each side of the looking glass, and should be arranged to draw up and down. Electricity enables us safely to read in bed. A hinged bracket lamp should project from the wall over the bed, and should be shaded with silk. This lamp should be provided with one of the new switches, which are made to rest in three positions, viz., off, on, and an intermediate position giving half light. This is invaluable in case of illness. The dinner should be brightly illuminated. There should be no fierce reflection from the tablecloth and silver. Too dark red, lemon, and canary yellow should be avoided as shades. A fringe, however handsome, is not satisfactory. No ceiling light should be allowed to interfere with the charm of the light being concentrated on the dinner table, and it must always be remembered that in the dining room the dinner table is the first consideration. The rest of the room should be softly but not brightly lighted. A hanging pendant which will draw up and down is suitable for a quiet family meal, and makes a good centre for the extended table used for a dinner party. The ends of this larger table should be lighted by standards placed upon it. The wires from these standards pass through a small slit in the cloth and through a hole in the table to a socket in the floor. Old silver and china candlesticks can be well adapted for these standards.

NATIVE LEAD.—Lead in the United States amounted in 1890 to 187,000 tons of 2.000 pounds, or a little less than in 1880.

WATER PRESSURE.—To find the pressure in pounds per square inch in a column of water, multiply the height of the column in feet by 434. Approximately, every foot of elevation is called equal to one-half pound per square inch.

METALLIC MUMMIES.—A Frenchman, Dr. Variot, paints the skin with a concentrated solution of nitrate of silver, and reduces this with vapors of white phosphorus dissolved in sulphide of carbon, the skin being thus rendered dark and shiny. The body is then ready for the electric bath, which is served by a thermo-electric battery, giving a regular adherent deposit of copper if the current is properly regulated. With a layer of one-half to three fourths mm. thick the envelope is solid enough to resist pressure or shock. Dr. Variot further incinerates the metallic mummy, leaving holes for the escape of gases. The corpse disappears, and a faithful image or statue remains.

NEW BLEACHING FLUID.—Ozonin, a bleaching fluid, patented by L. Schreiner, is made as follows: 125 parts resin are dissolved in 200 parts of oil of turpentine, to this solution is added a solution of 22.5 parts potassium hydrate in 40 parts of water, also 90 parts hydrogen peroxide. The resulting jelly exposed to light changes in two or three days into a thin fluid called ozonin, this same change takes place in the dark, but then requires some weeks for its completion. An emulsion of one gramme ozonin in one liter water acts as an energetic bleaching agent on fibers, wood, straw, cork, paper, also on solutions of gums and soaps; the bleaching effect is as energetic in acid as in alkaline solutions.

APHASIA.

A SINGULAR DISEASE AND ITS GROTESQUE EFFECTS.

Aphasia is defined in Ranney's "Lectures on Nervous Diseases" as an impairment of the idea of language or its expression, independent of paralysis of the tongue. It is commonly described as of two varieties—the sensory or amnesic form, in which the memory of words or of symbols is more or less effaced, and the motor or ataxic form, in which the memory is perfect, but the subject cannot properly pronounce words from an inability to perfectly co-ordinate the muscles concerned in articulation. In the amnesic variety the most familiar objects are commonly misnamed, and a great peculiarity is that the subject is often aware that the error has been committed, but is not able to correct it. Some patients forget only names; others forget numbers. In certain reported cases the names of things only in dead or foreign languages were retained; in others the reverse had been observed, the patient losing all knowledge of acquired tongues. The sound of words often will not be recognized when the letters which form them will, and the reverse of this condition is not infrequently met with in aphasic patients. In the ataxic variety of aphasia the patient can usually write what cannot be spoken, thus proving that the memory of words seen or heard is not effaced, but rather the ability to so co-ordinate the muscles of speech as to properly pronounce the words. Several cases have been found where the amnesic form gave place to the ataxic. An explanation of the general causes of this disease cannot be well given without using technical terms, which would be incomprehensible to the lay mind. It is sufficient to say that investigators have concluded that aphasia is consequent upon lesions of those certain areas of the brain wherein are centred the power for the normal exercise of the functions affected. The different phases or varieties of the disease indicate the parts affected. The most interesting facts in connection with the cortical cells of the brain have been demonstrated during the investigation of aphasia. Prof. Charcot reported a case where a gentleman could read by tracing the lines with his finger when a lesion of the brain had deprived him of his ability to recognize written or printed characters by sight. He could write with ease, but could read what he had written only by retracing the lines. Paraphrasia is the substitution of wrong words or symbols in conversation or writing. The remarkable fact is that the patient is conscious of his error, but cannot correct it. Nouns are more frequently lost than verbs. Patients of this sort often exercise great ingenuity in avoiding during conversation or writing the words they fail to properly recall. By means of oddly constructed sentences they often hide this defect in speech from strangers. In true motor aphasia patients cannot articulate correctly, a fact of which they are painfully conscious, and they often remain mute rather than subject themselves to ridicule or criticism. The ludicrous part of this phase of the disease is that in case certain words or phrases are retained or regained after the attack these words or expressions are used in a peculiar automatic way by the patient in reply to any question asked. These phrases or words are, of course, in the majority of cases absurdly irrelevant to the question asked. Dr. Ranney, in his work already quoted, cites a case reported by Hammond where a patient would reply "Hell to pay" under all circumstances. Another patient's unvarying reply was, "I want protection," and a third would say nothing but "Umbrella, umbrella." That condition in which, from cerebral disease or other causes, the power of writing is suddenly or gradually lost is called agraphia. The explanation of this condition rests in the fact that the patient has lost certain memories which previously enabled him to make the necessary finger movements for placing upon paper results obtained by his mental processes. This is certainly to the lay mind a most remarkable condition of affairs. It well illustrates the direction of the muscles from the brain, for the directing force being absent the muscles cannot act. An agraphia patient cannot write from dictation or copy from a printed slip, though he is not paralyzed or affected with writer's cramp, and though he can perform all other movements of the fingers not connected with the writing of letters or figures with his accustomed delicacy. The memory alone is at fault. In some instances delicate finger movements required in the mechanical trades or the use of musical instruments have been known to be suddenly taken away by a similar loss of motor memories. Such cases are not included under the term agraphia. "Word deafness" and "word blindness" are forms of sensory aphasia due to lesions of different portions of the brain. The word deafness results from a lesion of the first temporal convolution. Patients suffering from it cannot be made to understand spoken language, because their centres of hearing have been impaired. It must be understood, however, that they are not deaf to sound. They can hear a word spoken, but cannot tell what it means, because they cannot appreciate the value of certain sounds. Their own tongue is as unintelligible to them as an unknown foreign language. This condition prevents the patient from speaking correctly because of his inability to recall the proper sound of many words previously employed by him. His efforts to read aloud will result in his utterance of a most ludicrous jargon of unintelligible sounds. The patient, however, will proceed solemnly with his reading, not being aware that his utterances are unnatural or inexpressive of the ideas he wishes to convey. The following case is quoted from the books: One such person was asked to read aloud the sentence: "You may receive a report from other sources of a supposed attack on a British Consul-General. The affair is, however, unworthy of consideration." The patient proceeded to read seriously and steadily, as directed, and as nearly as could be taken this is what he said: "So sur wisjec coy wenement apripsy fro freny fenement wiy a seconce cos foz no Sophias a the freckled pothy conollied. This affair eh oh cont oh curly of consequences." This patient could not write to dictation, though he could sign his name well and copy accurately. As he made each letter, however, he would attempt to name it aloud, but always pronounced some other letter. Word blindness is due to a lesion of the visual centres in the occipital lobes. It is accompanied by a loss of memory of the meaning of printed or written symbols. Patients afflicted with it can recognize familiar faces, but they cannot read correctly. They cannot properly read a given selection. They can often write from dictation, but cannot read what they have written. Unless "word deafness" is also present their conversational powers are not impaired. One patient, whose case is cited by Dr. Ranney, when asked to read, would make the most elaborate preparations, putting on his spectacles and taking some time adjusting himself comfortably. Then he would read aloud, saying things that had not the remotest connection with anything in the print before him. He was asked to read the following note:

Dear Sir:—I shall be much obliged if you will let me know whether or not you consider it likely that A. B. will recover.

He looked at it very carefully, and then slowly, deliberately, and without much hesitation he read:

"*Dear Sir:*—You are requested to bring this note with you to the infirmary."

Then he said: "That is what I make of it; I don't know whether it is right or not." This same patient often tried to read a newspaper aloud, and his wife said that he read a lot of stuff all made out of his own head. On one occasion she took the paper and read it to him He was quiet for a time and then asked: "Is that what it says in that paper?" Being assured that his wife had read correctly, he said: "Well, then, I must be an idiot." This gentleman often found fault with the newspapers, saying he did not know what was the matter with them, they contained such silly stuff nowadays. When, however, he found that the fault was in himself he gave up reading the papers. "Word blindness" would be a good excuse for a pupil who misconstrued when wrestling with his Latin recitation. It is not uncommon for word blindness and word deafness to be in conjunction, a fact which is easily explained by the close proximity of the visual and auditory centres. The term "apraxia" has been applied by some authors to cover a class of cases where, by disease of the cortical centres of sight, the patient has been rendered psychically blind, not to the meaning of words, but to the most familiar objects and their uses. Such patients, after being disrobed and having their garments returned to them, express utter ignorance of the garments or their uses, and have to be given instructions as to the manner of dressing themselves. Other patients are afflicted with "amimia"—that is, a lack of power to express the psychical states by means of gestures, though the meaning of gestures made by others may be appreciated. Recovery from all these various forms of aphasia is possible, but difficult. In cases of word blindness the patient has to be instructed in his native tongue as a child is instructed. Where recovery fails, paralysis and insanity often follow.—*San Francisco Chronicle.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress.

FRUITS.—Apples, bananas, oranges.

PRACTICAL RECIPES.

SAVORY SOUP.—Chop fine a good-sized onion, shred up enough parsley, sage, and sweet herbs to make a tablespoonful of each, and put them all in a quart of beef or other soup and let them boil for a few minutes; then put the soup-kettle back on the stove, where it will simmer gently until about half an hour before the time to serve it; then thicken it with two teaspoonfuls of flour rubbed smooth in a little cold water; just before serving add two hard-boiled eggs, chopped into small pieces, and serve.

VEAL CROQUETTES.—Chop up very fine any scraps of cold cooked veal; season highly with grated lemon peel, sage, thyme, pepper and salt. Put a tablespoonful of butter and one of flour to cook in a saucepan; thin out with milk or cream to the consistency of very thick cream; add to this the chopped meat; pour out on a plate and let it get cold; form into egg-shaped balls, dip in egg and cracker crumbs, and fry in very hot lard. Fry only three or four at a time, for putting very many at one time into the lard cools it, and they are apt to be spoiled.

VEAL FRITTERS.—Cut cold veal into very small bits; sprinkle salt, pepper, and a little lemon juice over it, and let it stand for about an hour; then make a batter, allowing three eggs, a teaspoonful of baking powder and some salt to a pint of milk, with sufficient flour to make it the right consistency; put the meat into this, and fry by spoonfuls in boiling hot lard.

BREAKFAST POTATOES.—Cut up two cupfuls of cold potatoes; season them with pepper, salt, chopped parsley, and a very little lemon juice; put them in a pan with a tablespoonful of butter; cook for a moment; then pour over them a cupful of soup stock; cover and simmer a few moments before serving.

FRIED OYSTERS AND CELERY.—Put in the pan you are to fry the oysters two tablespoonfuls of equal parts butter and beef drippings; add to this a small cupful of chopped celery; cook it for a moment, mix it up, and in this fry the oysters which have been drained and dipped in egg and crumbs. Fry until a fine brown, and serve.

PULLED BREAD.—This is to be served with soups or with cheese. Take a very fresh loaf of baker's bread and pull out the insides, divide it into rough pieces, lay them on a baking pan and put in a moderate oven until they are brown and crisp.

INDIAN PUDDING.—Put four cupfuls of milk in a farina-kettle; when it comes to the boiling point sprinkle gently in two and a half scant tablespoonfuls of Indian meal; let it cook a good ten minutes, stirring frequently; then add a tablespoonful of butter. Beat up three eggs and to them put four tablespoonfuls of sugar; remove the kettle from the fire and add the eggs to the milk and Indian meal; turn it into a buttered dish and bake for about an hour.

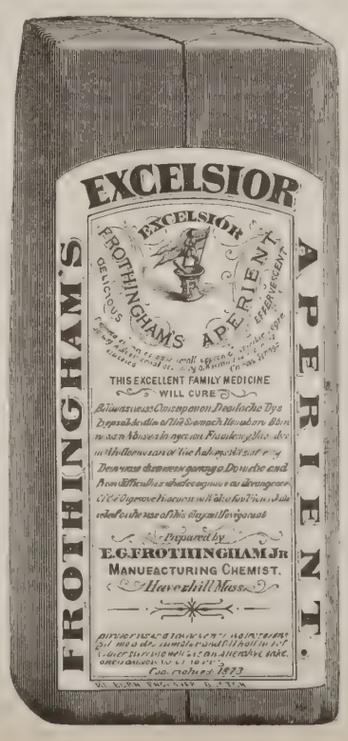
CONDENSED MILK.

We call special attention to matter in this issue all about condensed milk.

ADULTERATED FOOD.

A WASHINGTON CORRESPONDENT DRAWS A MELANCHOLY PICTURE.

The wholesale manner in which sensational newspaper writers overstate their themes is well shown in the subjoined article from the *Hartford Courant*, which publishes it as a communication from its Washington correspondent. Its extravagancies, spun from a slender thread of truth, do not call for serious refutal at our hands.



From recent exhaustive investigations of the subject the U. S. Department of Agriculture estimates that 15 per cent. of the total food supply of this country is adulteration, representing an actual loss to the people of $675,000,000. The inventive genius of the American has been taxed to devise methods of almost incredible ingenuity for the sophistication of every imaginable thing intended for eating. Scarcely a brand of the so-called "package coffees," contains any coffee. They are mainly composed of peas, chicory and rye, roasted and ground. The small "chefus" nut occasionally found in the market is used for the same purpose, as well as almond shells, which, treated with molasses and ground, make a fair imitation. A process is also applied to coffee which reminds one of the plan by which, when Jumbo died, two elephants were made out of his remains, one being the skeleton and the other the stuffed skin. The coffee is submitted to processes by which the essential oils and the essences are extracted from the beans, which are then sold as coffee, while the essences are manufactured into extracts and sold as such. A very usual method is to take the coffee beans thus shrivelled by the extraction of the oils and essences and soak them in sea-water, which "plumps up" the berries and conveys a pleasing deception to the public. If you want good coffee, it is a fairly good rule to avoid the highly polished, colored and plump grains, and purchase the poorest looking article you can find. Bologna sausage has always been regarded as a mystery, but no one would readily suspect adulteration in it. And yet not only is the mixture of which it is composed commonly more or less decomposed, tainted meat, being cheaper than fresh, but the condition of the material is effectually disguised to the purchaser by what is known as a "coloring," made of salt, saltpetre, borax, alum and Venetian red. Colorings play an important part in the business of the adulterator. Three small "greened" pickles contain the full medicinal dose of sulphate of copper, two grains. Vermicelli manufacturers use poor flour, whitened with pipe-clay, and supply the absence of eggs with saffron and chromate of lead. Strawberry ice cream commonly is made by dispensing with the fruit, using aniline red and amyl ethers instead. Persons who are addicted to that very popular drink called whiskey, ordinarily regard the fusel oil which it is apt to contain when too new as detrimental to their health, but the Government chemist says that one plate of ice cream or a single glass of soda water frequently contains more of this deadly product than five glasses of poor whiskey. Brandy nowadays, instead of being produced by the fermentation of grapes, is a complex mixture, derived by distillation from grain, potatoes, and the refuse of beet-root refineries. Potato spirits and beet alcohols, most deleterious of all varieties of spirits, are sent from Germany into France in vast quantities, to be flavored, colored and labelled to meet the wishes of American connoisseurs in cognac. Cider vinegar is almost never made from apple juice, and an article claimed to be pure orange juice, and found on sale as "orange cider," proved upon analysis to be only sweetened water, sharpened up with citric and tartaric acids, and flavored with the oil derived from orange peel. Practically all of the flavoring extracts used more or less in every family are mixtures of acids and drugs, the manufacturer of a pure article having no chance in the market. From 40 to 50 per cent. of the drugs sold in apothecary shops are adulterated. The licorice drops given to children for colds are made from candy factory sweepings, a fair quantity of dirt being included. Artificial jellies are composed of gelatine, sugar, artificial flavoring extracts and cochineal. Two-thirds of all teas from China and Japan are colored with Prussian blue and other chemicals. Cheap fish are packed and sold under the names of superior kinds. Honey is adulterated with glucose. White and black pepper are falsified with wheat, rice, corn and ginger. Most farinaceous substances which have become damaged and unsalable are rendered serviceable by the "spice mixer," being transformed by roasting and grinding into products closely resembling the various spices in appearance, lacking only a little seasoning with the real article to give the characteristic odor and fit them for market.

THE DOCTOR WHO SUCCEEDS—A physician who understands human nature, who plays with the baby, makes friends with the children and listens to the woes of the good wife and mother, is the fellow to whom the master of the house most cheerfully pays the largest bills. It isn't the medicine that's bottled up, but it's the comfort, the consolation that are unbottled' that mark the broad line between an unsuccessful and a popular physician.—*Press.*

25 CTS. PISO'S CURE FOR CURES WHERE ALL ELSE FAILS. Best Cough Syrup. Tastes good. Use in time. Sold by druggists. CONSUMPTION 25 CTS.

HOW OFTEN

you feel the need of a reliable remedy for the easy and safe cure of Headache, caused by bilious trouble or dyspepsia.

FROTHINGHAM'S APERIENT

is what you need. It comes in a fine white powder, and you take two teaspoonfuls, and add a little water, and drink while foaming.

IT'S VERY PLEASANT TO TAKE.

All Druggists should have it. If not, send FIFTY CENTS for a large trial bottle, and receive it by Express, prepaid, Address,

S. C. BASSETT,
SOLE U. S. AGENT,
HAVERHILL, · MASS.

NOTES REGARDING THE USE OF

MILKMAID BRAND CONDENSED MILK

FOR INFANTS.

HOW TO JUDGE THE QUALITY OF CONDENSED MILK.

The general appearance when poured from a spoon should be homogeneous and glossy; the more glossy the better. It should be ropy or stringy, like very heavy syrup. The color should be that of cream, but the color varies according to the season of the year in which the milk is condensed, the same as milk not condensed varies in color. Milk is more yellow in summer when cows are on pasture than in winter when they are fed on dry hay. Thickness varies with age. Thickening by age is *natural* to condensed milk; rapid thickening only proves that the milk is preserved in the best manner, and that it retains in the highest degree the characteristics of milk in its natural state. Condensed milk which does not thicken by age, or which thickens very slowly, is milk *abused in the process of condensing*. Consumers make a great mistake in supposing that the thinnest condensed milk is the best. The thinnest condensed milk contains the most water, and of course, less of milk solids or milk nutritives. The thickest condensed milk, if in sound condition, is the most valuable. There is a degree of thickness, however, that is inconvenient. If condensed milk is so thick that it will not run out when an opened can is inverted, it is troublesome to dissolve. If it is not actually hard, *very little stirring in the can* will render it sufficiently liquid for convenient use.—*From Scientific American, December* 27, 1890.

SHORT WEIGHT.

A can of condensed milk which does not weigh 18¼ to 18½ ounces does not contain a pound of milk.

When using a brand of milk one ounce short of full weight, the consumer loses the value of a can in every sixteen cans he buys.

Consumers are **wasting several hundred thousand dollars** per year by buying short weight condensed milk.

CONDENSED MILK FOR INFANTS.

Children may suffer from over-feeding, or from food too rich and nutritive for proper digestion, as well as from receiving too little nourishment.

Through a mother's anxiety to do everything possible for her child, she not unfrequently permits its food to be prepared in so rich a form that it fails to thrive through indigestion, and the mother is led to the mistaken conclusion that the particular food in use is at fault, whereas the true cause may lie in the *manner* in which the food is employed.

A child may not always become ill by receiving more food, through richness or volume, than can be assimilated, but only that part assimilated nourishes, and the part not assimilated can serve no wholesome purpose.

One physician will recommend feeding infants with twice as rich food as another, and, to prove his directions correct, will refer to his experience with his own children. Another physician will argue that these same children would have thriven equally well, if not still better, had they received the same food less rich in form.

An infant does not require a frequent change of food, as mothers sometimes suppose. A proof of this is the fact that nature designs milk for the young, *without change*, for a period of at least eight or ten months.

So long as a child thrives well upon any particular food, it is advisable not to resort experimentally to any substitute—at least not before the period of teething has passed.

If any certain food does not agree with a child, either in one degree of strength or in another, then the trial of something else is the proper course.

Children, like adults, may become ill while receiving the best of food; for instance, a child nourished on mother's milk does not enjoy full protection against diarrhœa at any time, and all children, however fed, are liable to this and other complaints, especially during the time of teething; therefore the cause of illness should not always be attributed to the kind of food made use of. The cause, if it lies in the food at all, may be often found in the improper strength in which the same has been prepared, or in *failing to observe regular intervals in feeding*.

In nine cases out of ten a weak stomach is an abused stomach.

Those who make a practice of running for the feeding-bottle every time a child cries are incompetent, even though they may be mothers, to take charge of infants.

A child should not be fed while lying upon its back. Let the infant be held upon the left arm in an inclined position, not only while taking food, but for five or ten minutes afterwards.

AVOID MISTAKES.

Our **Swiss Milk,** for which many other kinds of milk produced in Switzerland are palmed off, is known by plain label, Milkmaid trade mark, and the full name, Anglo-Swiss Condensed Milk Co., **Cham,** Switzerland.

Our name is closely imitated by leaving off the word "Anglo." If you call simply for "Swiss Milk," you may be deceived. Be sure that you see our full name, and **Cham,** Switzerland, on the label.

Milkmaid Brand, colored label, and **Rose Brand,** colored label, are produced at Middletown, New York, and Dixon, Illinois.

OBJECTIONS TO COWS' MILK, NOT CONDENSED, FOR INFANTS' FOOD.

1st. It is difficult to obtain it pure.

2d. If obtained pure, it is impossible to have it in the same condition at all hours of the day. Milk not condensed is subject to constant change, even before sourness can be detected.

3d. It lacks the uniformity of character and strength which is ensured by condensing milk in large quantities, whereby the milk from hundreds of cows is put together.

4th. The albumen of milk is more easily digested if the milk is condensed. Dr. F. D. Drewitt, of London, tells why.

5th. Milk not condensed is a powerful absorbent of any surrounding impurity, and may therefore serve as a medium for the transmission of disease. It is well known that the cause of fevers has not unfrequently been traced to the use of tainted milk. In several instances of this kind, which have been reported in public journals by good authorities, it has been observed that "those using Condensed Milk have escaped." The process of condensing sterilizes milk.

Read Dr. F. Dawtrey Drewitt's article from the London *Lancet*.

DIRECTIONS FOR PREPARING CONDENSED MILK FOR INFANTS.

It should be understood that it would not be practicable for us to give exact directions for employing Condensed Milk, for the reason that the amount of nourishment suitable for one child may be too little or too great for another.

Physicians and nurses must determine the strength or quantity of food to be given in each individual case; experience enables us, however, to give approximate directions to be followed for infants of average health and strength.

During the first weeks of infant life the following directions may be observed:

For the *first two days* give nothing but sweetened water; for the next five days a half teaspoonful of Condensed Milk with eight teaspoonfuls of water every two hours, day and night.

For the *second week*, ¾ teaspoonful of Condensed Milk with 12 teaspoonfuls of water every two hours, day and night.

Third week: 1 teaspoonful of Condensed Milk with 16 teaspoonfuls of water every two hours, day and night.

Fourth week: 1¼ teaspoonfuls of Condensed Milk with 18 teaspoonfuls of water every two hours, day and night.

Second month: 1½ teaspoonfuls of Condensed Milk with 21 teaspoonfuls of water every two hours by day and two to three hours at night.

Third month: 2 teaspoonfuls of Condensed Milk to 24 teaspoonfuls of water every two hours by day and about once in three hours at night.

Begin the fourth month with 2 to 2½ teaspoonfuls of Condensed Milk to 24 teaspoonfuls of water, and gradually, during the fourth month, increase the amount of Condensed Milk to 3 teaspoonfuls, with 24 to 26 teaspoonfuls of water, or with an amount of water equal to the volume the child will take at one time, and at this age feeding at longer intervals may gradually take place.

By the fifth month experience will usually show how to proceed; but Condensed Milk for any child of any age should never be used richer than one part of Milk to seven parts of water.

The spoon used for measuring Condensed Milk should not be dipped into the tin, but should be filled by pouring from another spoon.

The Milk should always be prepared immediately before using, and all possible care should be taken to keep feeding-bottles clean and sweet. They should be cleansed with hot water immediately after having been used each time.

The water used should be previously boiled and cooled. In preparing the diluted Milk do not boil it, but merely warm it to blood heat, about 100 deg. Fahr.

Our **Milkmaid** and **Rose** brands, as food for infants, are equal to any known American brands.

Our **Swiss Milk,** containing a little less sugar than any brands produced in this country, is often preferred for babies, and it commands the highest price of any brand in the world

CONDENSED MILK AS FOOD FOR INFANTS.

BY F. DAWTREY DREWITT, M.A., M.D.

Assistant Physician to the Victoria Hospital for Children and to the West London Hospital, etc.

The commonest objection to the use of Condensed Milk as food for infants is that it is too sweet. Of course it is very sweet; but, on the other hand, cow's milk is not sweet enough, and, when compared with human milk, very indigestible.

Cow's milk not condensed can only be made at all a possible food for babies by adding to it sugar and water, and so making it more like Condensed Milk, but even then it is not so digestible as Condensed Milk, and it is not difficult to see the reason. Place some cow's milk with its added sugar and water in a wine-glass; mix in another glass some Condensed Milk with water till it has, so far as one can judge by the eye, about the same consistence and opacity; stand the two glasses side by side, and add to each, as the stomach does, a few drops of nitro-hydrochloric acid and watch the result. They both curdle, but the curd formed in the wine-glass of Condensed Milk is distinctly more friable, more mixed with the watery part than the curd in the cow's milk, and after standing for some time this is still more evident, for the curd in the fresh milk separates completely from the fluid into a firm clot, while in the Condensed Milk it remains more granular, more broken up, and more mixed with the fluid. It is this hard clot of cow's milk, not condensed, which is more than anything else the cause of that only too well-known incessant cry of dyspeptic hand-fed babies.

Condensed Milk, of course, varies in quality, and it is important not to use any of the common, cheap kinds. Of those which are generally seen in the shop windows, the nurses at our children's hospital generally prefer the ORIGINAL ANGLO-SWISS MILK, the "ONE WITH THE MILKMAID ON THE TIN," as they call it, and it seems to me as good as any.

Everything depends upon how Condensed Milk is given. *It ought to be diluted with ten or twelve times its bulk of water, or with more than that if the child is thirsty;* and if any tendency to nausea remains, *about one-sixth of the water* ought to be lime-water, which still further neutralizes the action of the acid of the stomach and delays the formation of the clot. The water should be boiled before adding it to the Milk, especially in the summer. It gets rid of the infusoria in bad water.

Three or four years ago, when I was a resident medical officer at the Children's Hospital in Great Ormond Street, where good cow's milk could always be procured, and where it was given with care and discretion, Condensed Milk formed nevertheless a valuable article of diet, and was and probably is still used in all the medical wards; but among the poor in their own homes, where common milk is often bad throughout the year, Condensed Milk is simply an inestimable boon. —From *The Lancet*, June 23, 1883.

CONDENSED MILK FOR CULINARY PURPOSES.

Use Condensed Milk for every kind of pudding and pastry—it saves sugar bills.

Use Condensed Milk in coffee, for ice cream, for milk punch and for every purpose requiring both milk and sugar.

Anglo-Swiss Condensed Milk Co.,

82 Hudson St., New York.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE.

A healthful tonic Used in place of lemons or lime juice, it will harmonize with such stimulants as are necessary to take. Dr. Jason Walker, Minot, Me, says: "I have used it with very pleasing results. I have prescribed it for nervous exhaustion; for that state of the nervous system following exposure to sun heat; for wakefulness in cases seeming to be due to nervous debility. Our young man at school had such a feeling of confusion in his head that he had to leave school. I gave Acid Phosphate, and he was soon able to resume study." Dr. E. J. Williamson, St. Louis, Mo., says: "I have tested its qualities in cases of diabetes with marked beneficial results, and am well pleased with the remedial qualities of the preparation." Dr. F. A. Roberts, Waterville, Me., says: "I have found it of great benefit in nervous headache, dyspepsia and neuralgia. I think it is giving great satisfaction where it is thoroughly tried."

LEA & PERRINS' WORCESTERSHIRE SAUCE.

From the Atlantic to the Pacific and from Maine to Texas, in the largest and smallest hotels, in every restaurant of any pretension, on the table of the millionaire as well as on the plank laid across two barrels in the miners' camp one can find this justly celebrated sauce. Its use is now universal in these United States. It has been used for a great many years in Europe as well as in the East. It is the only table sauce that has ever been the pattern to imitate. Its proprietors have had to expend large sums of money to suppress these frauds upon the public, and they have cheerfully and successfully done so. The question what makes the Lea & Perrins' Worcestershire sauce such a universal favorite and why is it the only sauce that counterfeiters have deemed it worth while to attempt to imitate is easily answered. It is because it is a really good article, possessing great merit as a help to appetite and digestion, and its qualities have been honestly and faithfully maintained. Those who once try it always buy it, and those who have once used it use it all the more. The purchase of the innumerable imitation sauces only leads to a diligent search for the original genuine sauce. None of these imitators have ever succeeded in getting a foothold in the market, and so we have another illustration of the fact that an article of real merit alone can maintain itself in the public esteem.

She reckons well

who does her housecleaning and washing (or has her servants do this work) with PYLE'S PEARLINE.

Why? Because Pearline makes the largest saving all around; saves half the time; half the labor—more than half the wear. Do you know you don't have to rub the clothes when washed with Pearline? This saves the woman and makes the clothes last longer (besides, they look better). What can be harder on woman's health than bobbing up and down over a wash board? What can be harder on the clothes—anything harder don't exist.

Millions of women know these facts well; it takes many millions of packages of PEARLINE to supply their demands for it. You have only to prove these facts and you'll demand it. The best way is—try it. Costs little and every grocer has it.

Beware Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearline, or "the same as Pearline." IT'S FALSE – they are not.

171 JAMES PYLE, New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month**, and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions**, arranged for practical use; timely hints to **Housekeepers**; cheering and helpful talks with **Mothers**; valuable information for lovers of **Flowers**; a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

Address THE AMERICAN ANALYST, 19 Park Place, New York.

THE N. Y. HAY EXCHANGE BULLETIN.

OFFICIAL REPORT OF THE HAY AND STRAW MARKET AT NEW YORK.

The N. Y. Hay Exchange is located at 601 W. 33d St., corner 11th Avenue.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER- Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, March 9, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	65c @	60c @
No. 1	55 @ 60	55 @
No. 2	50 @	50 @
No. 3 and Shipping	45 @	45 @
Clover Mixed	45 @ 50	40 @ 45
Clover	40 @ 45	40 @
Long Rye Straw	80 @ 85	— @
No. 2 "	60 @	
Oat Straw	40 @ 45	
Wheat Straw	40 @ 45	

Receipts week ending March 7, as follows:

Via N. Y. Central	176 cars.
" West Shore	100 "
Other roads by Lighter, 34th Street	25 "
Total	301 cars.

The market has been much stronger this week, and top quotations on all grades of hay have been easily realized.

Receipts have been smaller and have met with steady demand so that stock at various receiving points to-day is quite small.

Rye straw continues in large supply, and is in moderate request at quotations. Arrivals of oat straw have increased, stock is large and prices weaker.

Perpetual hay is in small supply and good demand.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$13.00 to $14.00
Hay, choice to fancy, perpetual pressed bales	12.00 to 13.00
Hay, fair to good	11.00 to 12.00
Hay, poor to ordinary	8.00 to 10.00
Hay, Clover and Clover mixed	8.00 to 10.00
Hay, swale	8.00 to 9.00
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	8.00 to 8.50

BOSTON, March 9th, 1891.

Receipts for the week are 178 cars of Hay and 25 cars of Straw; corresponding week last year, 265 cars of Hay and 21 cars of straw. The receipts of Hay for this week are much smaller than for any week for a long time. The accumulated stocks, although still large, are being slowly reduced; the tone of the market is better on account of the decrease in receipts, but as yet, there is no improvement to note in prices. Rye straw is quiet at quotations. Oat straw very dull; very little demand for it.

H. F. WILSON,
WIRE BALE TIES,
458 WEST 38th STREET, New York.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

WHAT IS WELL ENOUGH?

The Royal Baking Powder Company seems to have entered upon a new era of unscrupulous and deceptive advertising. The latest emanation is suggestively headed "Let Well Enough Alone." If "well enough" stood for Royal Baking Powder it would be good advice for the public to follow. Aside from this there is in its self-praise and denunciation of competitors not a word of truth in the whole advertisement. It does not require a chemist to ascertain that the Royal Baking Powde contains ammonia. Any housewife can put a little of that much advertised baking powder in the top of the can and place it on top of the stove. After smelling of it let her decide if she wants such an ill-smelling compound to go in the bread and cake she sets before her family. Anything that has an objectionable smell is unfit for human food. No first-class baking powder contains ammonia which is only added to obtain a stronger leavening agent cheaply and of course at the expense of cleanliness. The inuendoes about competitive baking powders containing alum, lime and sulphuric acid are gratuitous falsehoods, as they only apply to the very cheapest and poorest baking powders in market, and no one knows this better than the owners of the Royal Baking Powder. It is dust thrown in the eyes of the public to divert attention from the great Royal ingredient ammonia. The insinuation that all recommendations by grocers and cooking schools are paid for is very amusing as every one knows that the Royal ammonia powder has been put upon the market and kept there in spite of its great ammonia drawback by paid certificates obtained in many questionable ways. To read the Royal advertisements, one would almost believe that the chemists, State, government and otherwise, mostly otherwise, whose names and titles have been paraded before the public as endorsing the Royal Ammonia, generally with a large reservation hole to creep out of, had fallen over each other to give the Royal their approval gratuitously, especially since the public has seen that peculiar exemplification of the old proverb, when the owners of the Royal fell out and were compelled to settle with one another, and the profits of making Royal Ammonia from specially prepared tartar were proven in court to run up in the millions. It seems after all that it would be safer for housewives to take the benefit of the doubt and buy their baking powders from manufacturers who use only ordinary pure cream of tartar without ammonia, and therefore are not able to make such large profits out of a confiding public. It will be safer and better for the health of the community.

RUSSIAN TYRANNY.

One of the possibilities of "paternal government" is shown in the effort now in progress to suppress popular education in Russia. A prominent member of the Imperial family recently declared in a published article that "all popular education is an evil." This opinion has been endorsed with unusual unanimity by official circles in St. Petersburg, especially in consequence of the prevalent conviction that radical, if not revolutionary, ideas are invariably the result of teaching the common people too much. In accordance with these prejudices, the General Governors of Kiew, Volhynia and Podolia issued instructions to the provincial police some eight months ago that all home instruction of children should be subjected to a strict censorship. The remarkable manner in which the censorship was conducted has just been illustrated in the manufacturing city of Uladovka, in Podolia. The Chief of Police proclaimed that from now on all working men were prohibited from instructing their children at all, and, in order that he might test easily the fullness of their obedience to his order, he commanded that the workingmen's children should not be kept in the house, but sent into the streets, where he, in passing, might observe their occupations. This, however, was not enough. He was informed that several Roman Catholic laborers let their children read prayers and taught them how to write. Thereupon he announced that no educational books or tracts should be kept in the house. He made sure of the observance of his new order by having all his men turn in and search every workingman's house in the city. Wherever educational matter was discovered, or children were found studying, a full report of the details of the offence was made, and the books or other educational materials were confiscated. These unprecedented proceedings have been too much for a part even of the gagged Russian press. "Who has given the police the right to confiscate private property thus?' inquires the *Wedjeljad.* "Who has sent them into private houses to make searches? He is unknown to us. The result has been that in Uladovka all education of the young has been abolished, the parents have lost their heads, and the children are in the streets."

WOMEN'S RIGHTS.

The "rights" claimed on behalf of women seem to have encountered considerable opposition lately. On Marth 7, the Methodist Episcopal Conference of Philadelphia by a vote of 120 to 98 decided against admitting women delegates to the electoral and general conferences of that church. In like manner the Maryland Conference of the same church, sitting in Baltimore, defeated the measure providing for women delegates. Furthermore the Kansas Senate has defeated the bill that had passed the House providing for the establishment of a female suffrage in that State. The bill in favor of female suffrage in North Dakota has been defeated in the Legislature of that State. The Wisconsin Senate has approved of a bill which prohibits actresses and singers from publicly appearing in such dresses as the bill declares to be improper. And on March 9, at the monthly meeting of the Presbytery in this city, the General Assembly's proposition in favor of deaconesses in the church was emphatically rejected.

INFANT FOODS.

There has been a mass of writing upon this subject, but a great deal of it seems to have been concocted upon a plan similar to Talleyrand's definition of language—to hide thought. Surely there is nothing of greater importance to the human family than food for infants. Every one knows that in many cases infants are wholly or partly deprived of their natural and best adapted nutriment, mother's milk, and for such a substitute is necessary. What shall it be? The answer to this question seems easier than it really is. The substitute must be readily obtainable, easily prepared, digestible, assimilable and nutritious. No non-professional person can reliably answer these questions. Of course every manufacturer of infant foods claims that the particular food prepared by him is the best and only article that conforms to every requirement of the standard thus set up, and there are not wanting gentle-

men with a long string of title-initials to their names who will establish, to their own satisfaction at least, that the particular products which they were paid to puff is the *ne plus ultra* of infant foods. It goes without saying that none of these foods are as good as natural healthy mother's milk, therefore that product of artificial food which comes nearest to the standard of mother's milk, all other things being equal, is the best. The use of well-known names and high sounding titles does not prove anything. It is not the object of this article to make any invidious distinctions or odious comparisons, but to suggest to some disinterested scientist, who is competent, to institute a series of experiments with the different infant foods now on the market and publish the results without fear or favor, that the public may know how far to have confidence in the advertised virtues of the many different wares advertised.

A SMART BUSINESS WOMAN.

AN ENORMOUS ENTERPRISE CONDUCTED BY A WOMAN.

The American visitor who leaves the boulevards on the North of the Seine to visit Aristide Boucicaut's great creation is liable, unless he is otherwise directed, to select one of the old-fashioned and irregular thoroughfares that lead from the "Institut de France" to the heart of the Latin quarter. Whether he go up the Rue Bonaparte, the Rue de Seine, or the Rue de Saints-Pères, glimpses of old Paris will meet his gaze. The streets are narrow, and the ancient buildings—though more or less Renaissance in style—have a forbidding face that is only enlivened at times by the colored prints in numerous old print-store windows and the welcome signs of the ubiquitous *mastroquet*. After being stared at by sundry fat *concierges*—whose principal occupation in Paris seems to be lounging at their *portecochères*—the visitor, following the dingy pavement, reaches the Rue de Babylone, where a distant view of green trees greets him, from behind which rises a handsome block of new buildings—and he feels at once that he is approaching modern civilization again. That block constitutes the "grands magasins du Bon Marché." One is impressed with the structure from the first, and no wonder, for beside being five stories high, and adorned with divers domes, it covers a superficial area of 12,000 square yards. In this hive of industry are over 3,500 employees, of both sexes, and at no hour of the day does the attendance of customers fall below 2,000, while the average number is fully double that. With these figures before our eyes, we are not surprised that the last yearly returns of money taken over the counter should aggregate the almost fabulous sum of 123,234,523 francs, or little short of $25,000,000! The growth and development of this enormous enterprise is so intimately associated with the careers of Aristide Boucicaut and his wife, that a brief biographical notice of them must necessarily precede any remarks of the present condition of the house. Jacques Aristide Boucicaut was a typical provincial Frenchman—to his dying day he never acquired the Parisian accent—and was born at the commencement of the century in the town of Belème (Orne). The son of a small hatter of modest income, his battle of life began at an early age. He was clerk in a provincial dry-goods store, whence he drifted to Paris—that Mecca of all aspiring provincials. He at once found employment in the house of the "Petit St. Thomas;" but, in 1852, he entered the "Bon Marché," then a comparatively small dry-goods establishment doing business of less than 450,000 francs a year. The proprietor, M. Videau, retired from the direction of affairs in 1858, and five years later Boucicaut (whose energy had increased the annual volume of business to over 7,000,000 francs) bought out the concern on easy terms. Boucicaut was an original genius, and far ahead of his time in his conception of what business methods ought to be. He felt that extraordinary success could only be attained by offering special inducements to the public to buy, and securing the active co-operation of his employees by inducements no less substantial. To the public he offered his goods at the lowest possible prices, and he also adopted the rule of accepting the return of any article that had ceased to please the purchaser, provided the same had not been injured by use. Toward his employees he pursued a most liberal course; he improved their food and lodgings, lessened their hours of labor, and increased their wages, but more than all this, he laid the foundation for the beneficent oligarchical system, by which at the present day, the great majority of the "Bon Marché's" clerks are participants in the profits of the house. The first stone of the magnificent new edifice which was to replace the original building—a miserable construction—was laid on September 9, 1869, and upon its completion in 1872 the establisment entered upon a new era. It was far more than a dry-goods store; it had become an emporium for many articles of necessity and luxury never gathered under a single roof before. To all that is embraced in the term dry-goods were added jewelry, carpets, perfumery, furniture, bric-a-brac, harness, stationery, shoes, toys, and that host of small objects falling under the general term of *Articles de Paris*. In the year 1876, Boucicaut's philanthropic plans for the amelioration of his employees took a practical shape. Together with his son, Anthony Aristide, he founded the "Boucicaut Provident Fund," in the benefits of which every employee having a five-years' uninterrupted attendance in the house was allowed to participate. The fund was sustained by means of a sum annually deducted from the profits of the business, and an idea of its beneficent result may be gained from the fact that on the 1st of August, 1888, it had increased from 62,020 francs to 1,253,746 francs, the beneficiaries being 1,385 in number. Each participant in the fund has an individual account, which is increased by an annual interest of 4 per cent. on the capital. The right to obtain the capital is acquired by all female employees having served for fifteen years, and by all male employees serving twenty years. The fund has paid out since its foundation over 350,000 francs to its various participants or to their heirs. Almost simultaneously with the foundation of the Provident Fund, the owner of the "Bon Marché" organized a daily distribution of milk among the poor families who were overburdened with infant children. This was but one of the many outside charities that distinguished his career, and for which he received a gold medal from the Society for the Encouragement of Benevolence. Aristide Boucicaut breathed his last on the twenty-sixth of December, 1877, leaving the "Bon Marché" in charge of his only son. The latter had been born and bred in Paris, and had led a life not uncommon to the youth of that gay city. Lacking the stamina of his provincial ancestors, he succumbed, in 1879, to an insidious malady, leaving the great work of his father's brain and energy to the care of his no less energetic mother, Mme. Marguerite Guerin Boucicaut. This remarkable woman was born on the third of January, 1816, in the village of Verjux (Saône-et-Loire). The daughter of poor peasants, she came to Paris in her teens, and, while following the vocation of laundress, she met Boucicaut, then clerk at Petit St. Thomas. A short acquaintance sufficed to make the pair man and wife, and henceforth they worked together for the same laudable end. Not long after assuming control of the establishment, Mme. Boucicaut, in order to insure the continuance of the business after her death, incorporated the "Bon Marché" society for the legal limit of thirty years, with a capital of 20,000,000 francs, and opened a reserve fund, which at the close of the fiscal year of 1888, had reached the sum of 21,800,000 francs. Of the 400 shares of the company, she gave up a large portion to her employees on easy terms, and thus it was placed within the reach of even the humblest among them, first to become interested in the amount of business done, next to participate in the profits, and finally to become an actual member of the firm. In order to crown the work of her late husband, Mme. Boucicaut went even further. On the fourth of August, 1886, this good woman formed a "Retiring Pension Fund," and in order that it should in nowise depend upon the beneficiaries—her employees—for support, she endowed it with the sum of 5,000,000 francs out of her private fortune. Every employee with the record of twenty years' service is entitled to a pension, although it is not paid to males before their fiftieth year, nor to women under forty-five. The pension is for life, and varies from 600 to 1,500 francs a year. Mme. Boucicaut died at Cannes, on December 8, 1887. Her will was drawn up in "mystic" form, as the French put it; that is to say, its contents were known only to the testator herself. Of her many subordinates she had forgotten none. According to their length of service they received 1,000, 3,000, 6,000, or 10,000 francs. These bequests alone aggregated nearly 20,000,000 francs. In addition, the deceased left them her property of Fonténay-aux Roses, valued at over a million francs, as a convalescent home. Among her other legacies was the sum of 2,645,000 francs for the founding of three houses of refuge; 1,000,000 francs to the St. Nicholas College of Paris, and 500,000 francs each to the School for the Encouragement of Young Economists and the Preparatory School of the Rue Picpus. She also left large sums to various scientific, artistic, benevolent, and religious societies, and, in short, scattered her colossal fortune with an open hand. As showing her tolerant spirit—very unusual in a French provincial Catholic—it may be said that she bequeathed large amounts to the Protestant, Jewish, and Russian orthodox clergy of Paris. By a special provision of her will, Mme. Boucicaut appointed three of her oldest assistants a council of administration of the firm to conduct the business. Whether one enters the huge building of the "Bon Marché" by the Rue de Sèvres, the Rue du Bac, the Rue Velpeau, or the Rue de Babylone, the effect is equally amazing. Everywhere reigns the greatest animation, eager buyers seizing upon the fascinating bargains that attentive clerks are displaying. Here is a rainbow of colored silks, there are vast spider-webs of lace suspended in air. In this case are alluring devices in leather, in that, an orient of gorgeous fans. Perfect taste is displayed in the general arrangement of goods, and not least attractive are the smiling faces of the saleswomen, in their neat, black costume. An imposing staircase leads from each of the four large entrances to the floors above, where new tempatations beset the unwary. The "Bon Marché" employees never solicit patronage. The habit of "pricing" goods, so common in England and this country, is comparatively new to French vendors. Those women who have not the slightest scruples in monopolizing a salesman's time the best portion of a forenoon, with no other object in view than to satisfy their idle curiosity, are a special object of dislike. Every kind of nationality is represented in the "Bon Marché" at nearly every hour of the day. Indeed, there are moments when French is scarcely heard among the customers. The Anglo-Saxon element predominates, but you also hear a great deal of German, Russian, Hungarian, Italian, Spanish, and even some Asiatic tongues. It is a significant fact that of the hundred or more interpreters nearly nine-tenths are for the English language alone. Very few foreigners besides the English and Americans seem to be ignorant of the language of Molière. If appearances can be relied upon, the employees of the "Bon Marché" form a prosperous and happy community. Rosy cheeks and sparkling eyes seem to be the rule, and their dress is fresh and neat. They have little about them suggestive of the *calicot* (French slang for "counter-jumper"), that most despised of mortals in the centre of French civilization. Every one of the 3,500 employees of the "Bon Marché" is fed within the precincts of the establishment, while 500 of them are lodged there as well. A trip through the "Bon Marché" dining, sleeping, and sitting-rooms, the kitchen and pantry, well repays the visitor. The dining-hall alone is a marvel. It is the longest apartment of its kind in the world. The meals are taken in three

tablees; that is to say, the entire force is divided into three squads who eat in turn, each *tablee* being allowed a full hour; for your Frenchman, whatever else he will submit to, objects to being rushed through his food. And how different are these meals to the wretched nourishment consumed by American clerks at their boarding-houses and cheap restaurants! To begin with, each person receives his half litre of good red wine both at *dejeuner* and dinner. That detail alone signifies four thousand quarts or thereabouts a day; for the truckmen and manual laborers are allowed an extra bottle. By the payment of one or two sous extra, the diner can have his little glass of cognac, kirsch, or anisette. As the working hours are very long, extending from eight in the morning to eight at night, the meals are considered the proper time for relaxation. After terminating their repast, the clerks linger over the fascinating. *petit verre*, discussing politics or playing dominoes. There is an extensive and well-equipped kitchen and a large staff of cooks under the supervision of an experienced *chef*. The employees of the "Bon Marché" enjoy other advantages beside that of being well fed. The worthy founder of the house established free evening classes for vocal and instrumental music, foreign languages and fencing. The most promising students in English are sent to London, at the expense of the house, for six months to perfect themselves. I was present at an assault-at-arms and a musical entertainment, and can bear testimony to the excellence of both performances. Unlike the English "bazaar" stores, the "Bon Marché" only insists upon exercising that close supervision over its employees which is evolved by their living on the premises so long as their salaries make it impossible for them to lodge comfortable elsewhere. Thus, young fellows from the country, who enter the establishment with merely nominal wages, find a temporary home ready prepared for them, which they leave when advancement enables them to provide entirely for themselves. The plan is a still greater boon to the young women who constitute a large percentage of the *internes*, or indoor population of the "Bon Marché." Realizing the temptations that beset their paths in a city like Paris, Mme. Boucicaut devoted motherly attention to them. She set aside comfortable apartments for them in a new building belonging to her in the Rue de Babylone, in which every inmate was given a large, square room to herself and the use of a handsome salon, or sitting-room. Monthly entertainments would be given and receptions held, and, in fact, everything done to make life agreeable. There is nothing of the barracks about the Boucicaut premises, and the polished oaken floors, prettily draped windows, and ornamented mantels impart a home-like air. The salon above-mentioned is furnished in plush, and contains oil portraits and marble busts of Aristide Boucicaut and wife. The girls have unrestricted access to the apartment, and scarcely an evening passes that they do not congregate there to enjoy the excellent piano and each other's society. The handsome and capacious stables of the "Bon Marché" lodge two hundred horses. The architecture is modeled after that of the Duc d'Aumale's stables at Chantilly, and is most imposing, with its Grecian columns, iron-work wrought into many artistic forms, and marble slabs and wainscoting of variegated hues. In the adjoining court-yard stand eighty vans, which daily deliver goods within a circuit of fifteen miles. I have referred to the council of administration, or board of directors, in whose hands repose the destinies of the vast establishment. This board is seconded by fourteen so-called *administrateurs*. The two bodies meet regularly three times a week under the presidency of M. Plassard, to discuss the interests of the house. There are, further, forty-seven buyers—with as many seconds, or substitutes—who meet about once a month for the purpose of submitting suggestions or complaints. The control of discipline and general supervision during working hours is vested in nine inspectors and twenty-four floor-walkers. Insubordination and especially acts of discourtesy towards customers are immediately reported and acted upon. Compared with salaries in America, French clerks are, as a general thing, underpaid; nevertheless, I was told that few of the "Bon Marché" employees make less than 2,400 francs a year in addition to their board, and many of the ordinary salesmen received as high as 5,000 and 6,000 francs. The buyers, on the other hand, were enabled to make all the way from 12,000 to 40,000 francs a year. As to the *administrateurs*, some of them are wealthy men, while the three chiefs of the establishment can be squarely set down as millionaires. The routine business of the store seems to run smoothly, but I think it would be expedited by the introduction of the American automatic cash "yanker." The "Bon Marché" has a tedious system by which every customer is obliged to wait until the salesman has delivered the money in person at the desk and registered the purchase. Among other features, the free art gallery deserves notice. Its contributors are allowed to pocket the entire proceeds of any sales they may effect without the payment of one sou to the house for commission. Then there is the daily charity to the poor of the neighborhood, who assemble, from eight to nine o'clock in the morning, at one of the side entrances and carry away sufficient food for themselves and their families. Nor should the splendid reading-room in the centre of the building, affording unlimited gratuitous convenience to the customers, be forgotten; and last, but not least, the "free lunch"—that glorious American institution, with a complete wine and liqueur list.

(*Argonaut.*)—V. GRIBAYEDOFF.

WHICH IS WHICH?

THE STATUS OF THE MALT EXTRACT CONTROVERSY.

For a number of years there has been sold in the United States a so-called malt extract under the name of "Hoff's." It was said to be made in Germany, and was claimed to be a non-alcoholic extract of barley-malt free from all preservatives or adulterations, and was largely advertised both to the medical profession and the public as a tonic of great virtue. Physicians were besieged with samples, and importuned to recommend it to their patients. Many yielded to these requests, and the consequence was a considerable sale for the product to the profit of the seller. Very soon there appeared in the medical and pharmaceutical press the advertisements of two rival houses, both claiming to be the "Original Jacobs," and attacking each other, impugning the genuineness and quality of the article manufactured by the opposition concern. It would puzzle a judicial mind to decide who was right, and it is quite possible that both were right or wrong; and if, like the Kilkenny cats, they had annihilated each other, the public probably would never have missed either. So much was admitted that the heads of the two antagonistic manufacturing firms were uncle and nephew, who had formerly been in business together. After they separated the uncle asserted that the nephew did not know the secret of manufacture, while the nephew as gravely insisted that the uncle never knew anything about the business. The battle-ground appears to have been in the United States, for, on the principle that a prophet has no honor in his own country, no one in Germany seemed to care anything about Hoff's Malt Extract, but here in the United States were two houses advertising and selling this stuff, and they immediately proceeded to attack one another. One said that the other made the stuff on this side and never imported any, while the other gravely charged that the stuff imported by the opposition was bogus anyway. Next they got into the courts and then the fur began to fly, and it was a big wash-day for dirty linen. After a while the decisions of the various courts *pro* and *con* were advertised, and here is where the real fun comes in. One house asserts that the German courts had found the opposition house guilty of publishing a false court decision, uttering a false affidavit and had fined them about $1,500, and that the opposition concern, feeling that they were beaten, had withdrawn an appeal made in the American courts from an adverse decision on an application for an injunction to restrain their competitors from selling the stuff under any similar name to their own. The opposition house also appeals to the profession and drug trade in an advertisement, and, strange to say, do not deny any of the damaging assertions of their enemies, but in a manner most amusing claim that their competitors, having but slightly changed their label, they have won a substantial victory, and therefore having accomplished all they could, have withdrawn their appeal from a decision, which denied their right to the very thing they wanted, and which they now claim their competitors have granted them voluntarily. The lame excuse that the manufacturer of their competitor's importation is not in reach of our courts prevents their establishing their own rights to a commercial trade-mark seems ridiculous, when it is remembered that the common law of trade-marks protects the consumer against being imposed upon by an article different from what he wants under a closely simulating title or label. If either one of these contending houses have an exclusive right to the title of Hoff's Malt Extract, or any title like it, the courts here will protect them, but the law demands that they shall be able to come into court with "clean hands." Can they? Aye, there's the rub. Until this is judicially settled it will be just as well for physicians and public to give these extracts a wide berth, employing some of the many other tonics on the market. It seems that neither house at present can give a clear, intelligible statement of the case. There is a skeleton hidden somewhere in the closets of one or both, and the outside public may as well wait until it is brought forth.

ALUMINUM.—A cubic foot of aluminum weighs 157 pounds. A cubic foot of copper weighs 558 pounds. A sheet of aluminum, 12 inches square and one inch thick, weighs 14 pounds. A bar of aluminum, one inch square and 12 inches thick, will weigh 1.17 pounds. A cubic inch of cast aluminum weighs 0.092.

LIBERTY.—"What is that figure on the dome?" inquired a female visitor of a Capitol guide. "Liberty, ma'am," he replied. "Liberty?" she repeated, with questionable scorn; "and it is a woman." "Yes'm," he responded, humbly; "but she ain't married, ma'am. Leastwise, her husband ain't never around."

NEEDED EXERCISE.—Doctor: "You do appear to be in a bad way; that's a fact. What's your business?" Patient: "I am one of the city laborers." Doctor: "It is as I feared. What you require, my man, is exercise."

FOLLOWING DIRECTIONS.—"It's pretty damp for a person with rheumatism to be prowling about, Uncle Josh." "Mebby, boss; but it's der doctor's advice." "Do you mean to tell me the doctor advised you to be out nights?" "Not 'zackly dat away; but he said I must have chicken brof."—*Life.*

SWISS SABBATHS.—In Switzerland a Sunday law has been enacted, applying to all railroad, steamboat and tramway companies and post-offices. Working time must not be more than twelve hours a day, even on occasions of increased traffic. Engine and train men must have at least ten hours' unbroken rest, and other employees nine hours. They must also have fifty-two days off yearly, and seventeen of these must be Sundays. No reduction in wages is to be made for such rest days. All freight traffic on Sunday is prohibited, except live stock.

TO PROTECT NEW YORK.—The government has recently commenced the work of locating batteries at Sandy Hook, to take the place of the old fort at that point, begun in 1858. Between that date and 1867 it is said over $1,000,000 were expended on this fort, which was to have been one of the most formidable in the world, but has become obsolete by the vast development which has taken place in modern heavy ordnance. The new batteries are designed to have twelve-inch guns and sixteen-inch mortars, with a range of from nine to twelve miles.

FRENCH ADULTERATIONS.

THE VARIOUS INGREDIENTS THAT ENTER INTO SO-CALLED OLIVE OIL.

Consul W. H. Brady, of Nice, reports on this subject as follows: "Much of the olive oil exported from France is adulterated with different seed and nut oils At least seven or eight of the seed products are so employed. When our fellow-citizens imagine that they are eating their salads with olive oil, it is most possible that at least a portion of the oil eaten is either cotton-seed, ground-nut (*Arachis hypogæa*), sesamum, poppy, camelina, rape, or flaxseed oil. The French farmer and the agricultural stations are doing what they can to remedy this, as growers of the olive are being seriously injured by these cheap mixtures, just as our dairy farmers were hurt by manufactured imitations of butter: but they can do little without the assistance of the buyers. It is quite possible to obtain the pure article now by co-operating with agricultural stations at shipping points, say Nice, Marseilles, and Bordeaux. Here at Nice, M. R. Brullé, director of the agricultural station, writes me that if buyers will make it a condition of their orders that samples of the oil to be shipped be placed at the disposal of the consul or director of the station by the oil merchant for analysis, he will analyze it and pronounce upon its purity, giving a certificate of the same to the merchant shipper. On receipt of the consignment the buyer, if he wishes, can repeat the examination by a comparatively simple process recently discovered by M. Brullé. If oil has not been sent according to sample furnished, the shipper will be liable to a criminal action. The fear of this would be a strong reason for honesty. It is to be hoped that the importers will accept M. Brullé's offer to compel the shipment of unadulterated oil, as I am informed that some of the compounds are quite injurious to health."

ROMAN DISHES.

ELEGANT TASTES SULLIED BY BARBARIC GROSSNESS.

Some one has said somewhere that the Romans, with all their splendid civilization, bequeathed to us but two priceless and enduring legacies—their laws and their cookery. Through both we have been moulded, but subtle as has been the influence of the Roman law, it pales before the significance of the Roman cuisine in shaping modern character, in forming the modern mind through the stomach. Plagiarists and gross imitators in the field of religion, literature and art, as the Romans undoubtedly were, they were splendid cooks. Much of their original thought found expression in the art and invention of the kitchen, and its influence is present to-day in our soups and salads, in our sausages and entrees. The authority of Apicius, the Roman epicure, has been no less potent than that of Justinian, the lawgiver. We are accustomed to conceive the Roman dinners as visions, forever departed, of gorgeous revelry and splendor, of delicate ease and refinement, enhanced by all the graces and seductions which charm the palate and the senses. Historians of the ancient world have told us so from time out of mind. When we read of the feasts of Greece, of Egypt, and particularly of Rome under the magnificent sway of Augustus and his imperial successors, the story is the same, be the scenes in the home of a private gentleman or in the palace of a dignitary of State. There are the same beautiful mosaic pavements, the carved fountains with jets of perfumed waters, rich bronzes, statues and gleaming candelabra, all the luxurious surroundings of wealth and ease. Finely sculptured images of ivory and silver, costly embroideries, couches quilted in rich-hued fabrics, the sweet odors of myrrh and frankincense—on every side, is an artful element designed to charm the senses. Viands of fabulous value, wines of untold age, cooks without peers or successors—these are the stories of the Roman dinners. But history very often neglects to tell us that the Senators of unbending dignity, the private citizens of traditional refinement, ate with their fingers and indulged in, during dinner, sufficient cleansing to constitute an ordinary bath. From under the splendid canopies there was noisome smoke no less than the strains of sweet music. The Roman dinner was of barbaric grossness. Intermingled with its pleasures were trying discomforts. Associated with palatable dainties were gastronomic outrages that would repel the modern epicure, disturb his temper, and offend his taste. An Augustan supper was often consumed hastily; it was always a gross and fantastic enjoyment. The Romans were voluptaries incapable of experiencing the finer delights of the table. They were gluttons, never epicures. The strongest appeal of the Roman cook was to the fancy, not to the palate. His ideas, which found expression in his cookery, were grotesque, even repulsive. He appealed to an appetite of cruel fancy, to one like that of the Roman sensualist, who could not relish a lamprey unless he imagined it to have been fattened on human flesh. He appealed to ostentatious extravagance. He peppered his master's drink with powdered pearls. He paid what would be equivalent to $5,000 of our money for a pie made from birds whose singing was supposed to immitate human voices. A dinner in the chamber of Apollo to which Lucullus invited Cicero and Pompey, cost 75,000 sesterces, or about $3,000. Precious stones were ingredients in many dishes. There were salmagundis made of the tongues of nightingales and the brains of birds of gay plumage. The goose, peacock, flamingo, and the parrot were esteemed as extremely delicious. But, with all the boasted art and perfection of the Roman cuisine, the ancient masters of the world had no sugar, no butter, no bread, as we understand the words. The ancient peoples of the south, as a whole, were without these primary elements of food, the substantial basis upon which the fanciful superstructure of the well-ordered table is built. Butter—the greasy substance which enters so minutely into most of the delicacies which please our palate—was to the ancient Greeks and Romans a thing of curiosity rather than of service. Its use for any dietic purpose was confined to a few old races neither under the influences of southern climate nor of Occidental customs. The Israelites were almost completely ignorant of its uses. The Romans, with their taste for oil, disdained the use of butter at their table with contempt. They knew of that kind only which was badly made. The curious character of their cooking precluded, in large measure, its necessity, but they went into sensual ecstatics over compounds which would nauseate a Hottentot. Poor butter with them made excellent medicinal service and none other. As did the Greeks, they learned of its character from the savages and uncouth tribes of the North, especially from Germany, where the rigors of climate stimulated its manufacture. In all the southern countries of the ancient world oil served the purpose of butter. It was one of the most constantly used elements in the kitchen—to our notions, one of the most abused. Another of our seeming necessities of life, sugar, was unknown to the ancients. Honey was its single substitute, and in most remarkable combinations and under strange conditions was it used. Upon meats, stewed, fried, boiled and baked it was poured. With wine, gum and spice it made the initiatory whet to appetite at the regular meal. Its purposes and relations were evidently but poorly known, and it was outrageously used. In describing a Pompeiian supper, Bulwer Lytton delicately characterizes that famous appettizer as diluted wine sparingly mixed with honey. He forgot the mucilage and spice. The Romans necessarily were ignorant of the subtler excellencies of fermented grapes. Wine was their constant and best loved drink, but it was like themselves, gross. Oysters and honey in conjunction, will, under average circumstances, make a modern epicure shudder. They were esteemed a delicacy by the Romans, who increased the flavor by the introduction of pepper and vinegar. Sweet and sour in constant contact was but one of the anomalies of Roman cooking. We know of the leavened and unleavened bread of the Israelites, of the loaves of corn bread given by the Roman Senate in times of popular distress. When we hear of bread in the annals of the Roman State it is in connection with plebeians and their riots and clamors. History tells us of the Senatorial regulation of quantity in those public bread distributions of old. In some measure also it details the character of food then given to the Roman poor. The excavations at Pompeii have laid bare to the modern world the entire interior of a Roman bakery. There, in full view, are its ovens, its great open fire-place, its kneading troughs, its primitive flour mills, its bread somewhat well done, after the baking of centuries. Upon each loaf is stamped the name of the maker or the sign of the shop. We know the size of the loaves, great and small, but both in the eyes of a dyspeptic would be intolerably heavy. Bread, in our sense of the term, light, wholesome, palatable, was unknown to the ancients. Coarsely ground grains, wheat or corn, leavened by an inadequate process, were the substitutes which the poor of Rome were compelled to accept, which the rich very seldom used. Nor for centuries after was there much improvement. Not until the reign of Elizabeth, the Virgin Queen, did bread assume its important position in the eyes of men. Frumenty, wheat boiled in milk, took largely the place of bread in the cuisine of the refined Romans. It was a constituent of most foods, but like all the elements of a Roman dish, suffered a transformation which completely disguised it in the final stage, when it was presented to the consideration of the imperial epicures. Thin biscuit, like wafers, sometimes broken into tiny fragments, tickled the palates of Roman gentlemen. Bulwer Lytton has given us quite an inadequate conception of a Roman dinner. He detailed its sensual pleasures, its strong appeal to refined sense, but he neglected to outline its gastronomic agonies. Pork was the passion of the Roman epicures, the spit, gridiron, frypan, oven, boiler and stewpan were utilized for its preparation. Imagine the delicacy or flavor of a baked pig, stuffed with thrushes, beccaficos, dates, onions, snails, mallows, beets, leeks, celery, cabbage, corriander seeds, pepper, pine nuts, eggs and garum. Down the back of the porker a great opening was made, and into it was poured a mixture of bitter rue, sweet wine, honey and oil, thickened with frumenty. That was a dish which would throw a Roman into ecstasy. He was a devotee of sauces and seasonings. He had many condiments, but garum was his favorite. He obtained it from the intestines, gills and blood of fishes, large and small, which were stirred together with salt, and exposed to the sun until fermented. Wine and spice herbs were added. It was strained and poured liberally on flesh, fish, game and fowl. Inferior kinds were prepared for the poor. It was prized above all other sauces. No thought of its repulsive, nauseating ingredients entered the minds of fastidious epicures. It gave piquancy to barbaric messes of fifty incongruous elements, in which sweet and sour, hot and cold, saline and mucilaginous compounds entered, with alarming disregard of subsequent consequences. The Romans could relish what was offensive, but they revolted against what was tough. With pestle, mortar and knife the Roman chef chopped, diced, and dissected infinitesimally until meats and vegetables were pounded to a delicate pulp. Haggis, as the Scotch call it, was a favorite preparation. It was boiled pig's stomach, filled with fry and brain, raw eggs and pineapple beaten into a pulp, and flavored with the never absent garum. Asafœtida was no inconsiderable element in the flavoring of foods. These were extraordinary mixtures of oil and wine, honey, pepper and the disgusting distillation from fish. There was frumenty in broths, stews, and hotch-potches. There was an extravagant love for unpalatable birds of fine plumage, for roasted lobsters, for sweetened oysters. A favorite pastry was a mixture

of rose leaves, well-beaten, brain and eggs, mingled with garum, pepper and wine, all lightly fried. There were also delicious figs, fresh herbs, anchovies, fruits, nuts, sweetmeats, tarts, and confectionary in fantastic fabric. The Romans had many elements of food, which to our sense are disgusting and nauseating; they esteemed as delicacies those which we feel offend the taste to the last degree. Yet they were courteous, luxurious in judgment and desires, honorable in their relations. Not the least significant in the banquet-room of the Romans were those festoons of roses which dropped over the gorgeously frescoed ceilings. Very seldom was the spirit it symbolized violated. No guest would betray the indiscreet words spoken "under the rose."

DOMESTIC DIETETICS.

SPECIALLY PREPARED FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress.

FRUITS.—Apples, bananas, oranges.

PRACTICAL RECIPES.

CLAM CHOWDER.—For ten people, allow 100 soft shell clams, two dozen small potatoes, four onions, one-half pound salt pork, a cupful of milk, about four tablespoonfuls of flour, salt and pepper. Separate the soft part of the clam from the hard and chop the latter very fine; chop fine the pork and onions, peel the potatoes and cut them into slices, mix the flour and milk for thickening. Put a soup kettle over a good fire, and when it is hot put in the chopped pork; put the onions on top and cover the pot, and let them cook together for a while; put in the potatoes, and then nearly fill the pot with hot water; when the potatoes are almost done, add the clams—the soft parts and the chopped ones; season; cook for a few moments; then add the thickening. If the chowder seems very thick, do not use all the flour and milk; if not thick enough, use more. Be sure and put in enough salt to make it tasty.

SWEET PICKLES.—Take one pint of cucumber pickles, and, if they are large, split and slice them; if they are small, let them remain whole. Put a mixture of half vinegar and half water, sufficient to cover the pickles, in a kettle, with a cupful of granulated sugar, a teaspoonful of whole cloves and one of allspice. When this boils, put in the pickles, and let them stew until they are a dark green color; then try them, and, if very tender and sweet enough, take them from the fire and put away for use; if not sweet enough, add more sugar, and cook longer. These are very easily prepared and are very nice.

RAISIN CAKE.—One cupful of butter, rubbed to a cream, with two cupfuls of powdered sugar. Beat up separately the yolks of five and whites of four eggs, and to the yolks add one cupful of milk, and pour it into the butter and sugar; now add the juice and grated rind of half an orange and half a lemon, and quarter of a teaspoon of salt; put in two cupfuls of flour and one-half cup of corn starch, sifted together, with two teaspoonfuls of baking powder; beat well, and put in one cupful of stoned raisins and, lastly, the beaten whites; bake in one large, square cake, or two small ones, and when done cover with an icing made of the extra whites and flavored with rose water.

COCOANUT PIE.—One pint of sweet milk, two eggs, the grated rind of an orange, one cupful of grated fresh cocoanut, a little nutmeg, and sugar enough to sweeten. Line a pie plate with good crust, put in the above mixture and bake in a good oven until the custard is set; then take out, cover with grated cocoanut, and serve cold.

SCALLOPED LIVER.—Boil some calf's liver until about half done; then cut into small, even sized pieces. Stew a few small onions in a little water, with pepper and salt, until they are done; then put in the liver, and let it cook slowly. When done, season and thicken the gravy, and serve.

PRESERVE RISSOLES.—Roll out some pie crust quite thin, and cut it into almost square pieces, rather wider than they are long; in the centre of each put a good tablespoonful of jam or other sweetmeats; fold over the edges and pinch them well together; then lay in a pan and bake a fine brown.

WATER AND FIRE.

WHAT IS REQUIRED TO QUENCH FLAMES.

A recent article in London *Engineering* gives some elaborate calculations about the quantity of water required to extinguish fires. The quantity of heat evolved in the combustion of wood is sufficient to evaporate 6.43 pounds of water, and this is the minimum quantity of water with which it is possible to extinguish a pound of burning wood. In actual practice the proportion of water is far in excess of this amount. In fact, it is well known that it is practically impossible to extinguish a fire in a building when the frame itself becomes ignited. The floors of mills and warehouses, when made of timber, weigh about 25 pounds to the square foot. They, therefore, contain, a sufficient amount of combustible material in every square foot to evaporate 160 pounds of water, or enough to cover the floor to a depth of two feet seven inches. During the great fire in Lynn, Mass., in November, 1889, which burned over an area of about forty acres, enough water was thrown upon the burning buildings to have covered the entire forty acres to a depth of seven feet. Two days later a great fire swept away some of Boston's finest commercial buildings, and enough water was thrown upon the flames to flood the burned area, streets included, seven feet deep. A fire in the picker room of a cotton mill was extinguished by automatic sprinklers, fed from a tank which had just been filled, and as it was only partially emptied it was possible to measure closely the quantity of water required to extinguish the fire. It was found that 107¾ pounds of water had been used for each pound of cotton burned. This was considered a small quantity, as the fire was very quickly extinguished.

HOUSE-CLEANING AND HOUSE-CLEANERS.

In every well-regulated household, certain times of the year are set aside for house-cleaning. When properly done, every rug, carpet, matting and oil-cloth is taken up and the floors and wainscoating scrubbed, sanded and disinfected. Every woven tissue is shaken and beaten; every wall and ceiling cleaned, revarnished, repainted or whitewashed; every closet, cupboard and pantry washed and purified, and every article of furniture freed from dirt or renovated. The true object of this varied and unpleasant operation is not so much cleanliness as it is health. Dirt is of course objectionable *per se*. It is doubly repugnant because it harbors vermin, microbes and the other dangerous forms of microscopic life, and acts as a breeding-ground for, if not all, nearly all of the maladies known as germ-diseases. House-cleaning when rightly done takes place at the beginning of each different season. In temperate climes, the early spring and early autumn are the favorite seasons, as scientifically they are the best. In warmer latitudes, the opening of spring, summer, fall, and winter are justly set apart for the process. The body is the house every one lives in. It is a million times more complex than the greatest architectural structure ever created, and it deserves and requires infinitely more care and thoughtful treatment. The laws of successful house-cleaning apply to it with perfect accuracy and completeness. Washing is a necessity as well as a comfort to one as to the other. To obtain the best results warm water, a dash of ammonia, and good rubbing with the hands should be the daily rule. In cleaning the head, do not use soap or alkali more than once a week. An excess removes the oil from the glands of the scalp and produces dandruff, raw surfaces and even baldness. The beating and shaking of woven fabrics may be compared to healthful exercise which is a necessity to one and all. The airing of rooms and the letting in of sunlight applies with equal force to our members. A sun bath is needful for health, almost as much as is pure, fresh air. But all this refers to the exterior of the body, and not to what is a hundred-fold more important, the interior. To cleanse this requires wisdom and prudence. The dirt here cannot be swept or brushed away. It must be washed away by the methods Nature has supplied. The simplest is the use of aqueous vegetables and acid fruits. These are easily digested and nutritious and, to a certain extent, have medicinal virtues. The tomato, onion and carrot are especially valuable in this regard. Tea, coffee and chocolate are all good, particularly when dilute. When very strong, tea and coffee are to be avoided. If you must drink alcoholic stimulants, use light wines, cider and perry. Malt liquors are bad for the kidneys, and distilled spirits bad for every part of the human economy. Above all, the blood must be kept free from all humors and impurities. These are the underlying source of nearly all diseases, no matter what their nature. To remove these effete matters thoroughly, as well to invigorate and improve the great vital functions is best accomplished by using Ayer's Sarsaparilla. There are other blood-purifiers of value, and many are of the greatest benefit in special cases. But no other medicine known to science will both purify the blood and restore the physical processes to their natural vigor and activity. It should be considered rather as a preventative of all disease than as a remedy for any particular symptoms. Because by dispelling or expelling the gradually accumulated humors in the circulation as well as in the fine tissues of the organization, it takes away the tendency toward any congenital or constitutional weakness or ailment, and at the same time strengthens that which is weak and stimulates that which is morbid or undeveloped. When used and properly used, Ayer's Sarsaparilla is the greatest aid in the house-cleaning of the body, and the greatest friend to health and strength that is known.

ORIGIN OF CLAM CHOWDER.—I am frequently asked "What is clam chowder?" and I have replied that more than thirty years ago I heard the poet Longfellow urge a French lady to eat some clam chowder because it was French. The lady looked up in astonishment and uttered a most significant *Comment donc!* Unto this Longfellow replied that the French originally settled on the borders of New England, and Mother Necessity soon taught them how to stew clams and fish in layers with bacon, sea biscuit (crackers), and other ingredients in a kettle (*chaudière*). Now, from the French the Indians learned the Roman Catholic religion, and a little of the French language and a great deal of the dish which the new-comers had invented. The Indians were not apt in the pronunciation or in the significance of French, and when they heard the Gaul speak of the *chaudière* the Indian supposed it referred to the food, and his nearest approach to the pronunciation was chawder—the name which early English fishermen and settlers learned from the Indian, and which the Anglo-Saxon in the New World further corrupted into chowder.—Correspondence *American Register*.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

RUMFORD CHEMICAL WORKS,

PROVIDENCE, R. I.

BEWARE OF SUBSTITUTES AND IMITATIONS.

Caution:—Be sure the word "Horsford's" is *printed* on the label. All others are spurious. Never sold in bulk.

BUSINESS NOTES.

BLACKBERRY CORDIAL.

What reminiscenses the old-fashioned term, blackberry cordial, brings to our mind, and when the suggestive words, Mother Putnam's are added, it needs not the motherly, benevolent face of that good old lady as depicted in Messrs. Rheinstrom Brothers' advertisement, to convince us that the same good old cordial which helped us out of many infantile attacks of pain and illness is still to be found. An article may be called blackberry cordial, and not contain a particle of blackberry, but consist of a vile compound of cheap extracts and atrocious spirits. Such, however, is not the case with Mother Putnam's Blackberry Cordial as manufactured by Rheinstrom Brothers. It is composed of the best and purest ingredients, every one of which is specially prepared and carefully tested by competent pharmacists, and the result is that all who have ever bought it will buy no other.

WM. R. WARNER & CO.

For the benefit of our medical readers we wish to say that Wm. R. Warner & Co., of Philadelphia and New York, have now a very extensive assortment of compressed tablets of some of the most useful drugs in common use. For practitioners who carry their own medicaments in cities for night use, and in the country for general use, these compressed tablets are exceedingly useful. They are prepared with the greatest care, and the well-known reputation of the house is the best guaranty of the quality and quantity of their contents. The prices are lower than the same medicines can be bought for in the usual and far less convenient form. Of their specialties, such as Bromo Soda, Licorice Lozenges, Soda-mints and Chlorate of Potash we need not speak, they are too well known. Physicians should send for their lists.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,
prove that Cleveland's is

THE STRONGEST

of all the pure* cream of tartar baking powders.

*Ammonia or alum powders, whatever their strength, should be avoided as injurious.

25 CTS PISO'S CURE FOR CURES WHERE ALL ELSE FAILS. Best Cough Syrup. Tastes good. Use in time. Sold by druggists. CONSUMPTION 25 CTS

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive precaution of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. COODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

GORDON & DILWORTH.

A good name is priceless. This is a true saying, and every business house keeping it well in mind finds that its success depends upon the keeping of its reputation without stain. As purveyors of preserved fruit of all kinds, Messrs. Gordon & Dilworth have succeeded, by hard, faithful, and conscientious business methods, in establishing the reputation that any goods bearing their name are just as represented in every respect. Many times in their long career they have been compelled to submit to heavy pecuniary losses to do this, but they have courageously stuck to their principles not to let even the slightest deviation from "everything first-class" pass into the market, and their present enviable standing has proven that their position was right. It only needs to be told that their reputation for putting up preserves better and cheaper than any housewife can do it, has become so well known among ladies that many buy Gordon & Dilworth's preserves rather than put up any at home.

OSWEGO STARCH.

It is hard to tell which is the best known—Oswego Starch, or the name of the manufacturers, T. Kingsford & Son. Both are household words, and every lady in the land immediately points to Kingsford's starch as the best known to her. The manufacture of this staple article from Indian corn was the invention of Mr. Kingsford many years ago. It has since been improved so much that it now looks as if further improvement was impossible. At every fair and exhibition it has received the highest medals and awards. It is sold everywhere, and at as low a price as a really good and pure article can be sold for. It has had many competitors, but has out-distanced them all, until it is now recognized as the reliable standard starch of the world.

HARTSHORN'S SHADE ROLLERS.

Who has not blessed Mr. Hartshorn for his invention, which did away with the annoyances of the old-fashioned shades, which would never "stay put?" If we remember the multiform troubles with the original shade which we had to roll up by hand, tie, and then attempt to balance, and the first improvement upon these by the cord rollers, which, though a great step forward, gave us the disappointing experiences of stretching cords and cords out of the groove, mounting on tipping chairs to get them in order again, we feel thankful for the ingenious invention of the spring roller. As Mr. Hartshorn was the pioneer, he has steadily kept his improvements in the van; and, despite numerous imitators, there is no better spring roller made than Hartshorn's.

A BOY'S DIARY.—"Monday, hired; Tuesday, tired; Wednesday, fired."

DISAPPEARS.—The late Duke of Bedford made the twelfth peer to commit suicide during this century.

NEWSPAPERS TO-DAY.—One sheet of paper recently made was eight feet wide and seven and three-quarters miles long.

BRAIN WASTE.—At present some 1,500 tons of phosphorus are used every year, and chiefly in the manufacture of matches.

COPPER YIELD.—The production of copper in the United States in 1890 amounted to 278,610,000 pounds far exceeding any previous record.

GROWING SCARCE.—Gum arabic, which was once universally used, has become very scarce and dear, and a substitute for it is being made from starch.

MEDICAL ETIQUETTE.—There are few, if any, patents on surgical instruments. When a physician gets up some new device he does not obtain a patent on it, but any one is free to make it, and the profession secures the benefit of it.

LIGHTNING HORSE-POWER.—It has been calculated that the electro-motive force of a bolt of lightning is about 3,500,000 volts, the current about 14,000,000 amperes, and the time to be 1-20,000th part of a second. In such a bolt there is an energy of 2,450,000,000 watts, or 3,284,182 horse-power.

JAVA TIN.—The shipments of tin from the Banca and Billeton islands, off the coast of Java, and from which the Netherlands India derive a considerable income, exceeded 9,000 tons last year, says the Indian *Engineer*. The production of Banca showed a falling off, however, as compared with previous years.

TEDIOUS PREPARATION.—In the University of Coimbra, Portugal, fourteen years are now required to obtain the degree of M.D., six being spent in obtaining the ordinary education, three in a preliminary scientific course, and five in purely medical studies. Now the students complain because the final examination is conducted in Greek.

UTILIZATION OF INSECTS.—An electric apparatus supplies a strong light which attracts the insects and moths; a suction fan, worked by the electric current, draws them in when they approach the light, and carries them into a small mill, also worked by the electric current, where they are ground up and mixed with flour, and thus converted into poultry food of excellent quality. This is said to be a Bavarian contrivance.

SLIGHT CORRECTION.—Eleven hundred years or more before Christ some ingenious Chinaman, it has been affirmed, invented the mariner's compass. A writer in the *China Review*, who has been investigating the subject, now asserts that the first unmistakable mention of the compass in Chinese records is not earlier than the twelfth century; and that the instrument undoubtedly became known in Europe before the return from China of Marco Polo, who is fabled to have brought it in his luggage.

LOST CHILDREN.—The Missouri and Kansas Telephone Company is considering the introduction of what might be termed a "lost child service." It was originated in Indianapolis by G. J. A. Halford, a brother of Elijah Halford, President Harrison's private secretary. As soon as a child was lost the information would be telephoned to the central station. When a lost child was found, this also would be telephoned. The finding would then be telephoned to the number that reported the losing. In some cases the child has been restored to its mother in twenty minutes after the loss was reported.

INFECTION A CRIME.—A movement has been set on foot in Michigan for the passage of a State law making it a crime to give a person a communicable disease. There are some towns in the State in which this is true at present, as Battle Creek, where a person is liable to be sued for damages if he inoculates another with a communicable disease. It is certainly a crime to sow the seeds of disease, being as immoral and wicked to contaminate a man's well with typhoid fever germs as it is to throw Paris green into it. Yet it is singular how apathetic the majority of people are upon the subject, and how they allow themselves to be defrauded without protest.

ANTIPODAL QUEERNESS.—The Japanese are a curious people. The Japanese carpenter planes towards him instead of from him. The Japanese horseman mounts his horse from the right side. The address of a Japanese letter is arranged in strict accord with the progress from the general to the particular. Thus, a Jap writing to a countryman in New York would place on the envelope: 'United States of America, New York State, New York West Tenth street, 115, Hoe, Yank." A Japanese always gives a gratuity upon his arrival at a hotel or restaurant instead of upon his departure. In drawing a cork the Japanese waiter never turns the corkscrew, but whirls the bottle.

DISTANCES OF THE STARS.—It is quite a familiar illustration to represent the distance of the stars in terms of the *light-year*, but it has not been noticed that the same figures which express in years the time light occupies in reaching the earth from a star will also express in miles the distance of the star upon a scale of the radius vector of the terrestrial orbit to the inch. The illustration appears useful, as it gives, perhaps, a more distinct idea of the isolation of the solar system in space than can be otherwise obtained, and does not introduce the question of time into the measurement of distance. Thus, if the annual parallax of 61 Cygni is assumed to be 0".434, which is probably very nearly correct, it will take 7½ (7.464) years for its light to reach the earth, and 7½ (7.499) miles will represent the distance of this star on a scale that gives one inch to the distance of the sun from the earth.—*John I. Plummer, Nature.*

Bet. 11th & 12th Aves., N. Y.

The N. Y. Hay Exchange is located at 601 W. 33d St., corner 11th Avenue.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, March 16, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	65c @	60c @
No. 1	55 @ 60	55 @
No. 2	50 @	50 @
No. 3 and Shipping	45 @	45 @
Clover Mixed	45 @ 50	40 @ 45
Clover	40 @ 45	40 @
Long Rye Straw	80 @ 85	— @
No. 2 "	60 @	
Oat Straw	40 @ 45	
Wheat Straw	40 @ 45	

Receipts week ending March 14, as follows:

Via N. Y. Central	176 cars.
" West Shore	100 "
Other roads by Lighter, 34th Street	25 "
Total	301 cars.

The market has remained about the same.

Receipts have been smaller and have met with steady demand so that stock at various receiving points to-day is quite small.

Rye straw continues in large supply, and is in moderate request at quotations. Arrivals of oat straw have increased, stock is large and prices weaker.

Perpetual hay is in small supply and good demand.

HAY, STRAW, FLOUR & GRAIN.

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy in large bales	$13.00 to $14.00
Hay, choice to fancy, perpetual pressed bales	12.00 to 13.00
Hay, fair to good	11.00 to 12.00
Hay, poor to ordinary	9.00 to 10.00
Hay, Clover and Clover mixed	9.00 to 10.50
Hay, swale	8.00 to 9.00
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	8.00 to 8.50

BOSTON, March 14th, 1891.

Receipts for the week are 198 cars of Hay and 29 cars of Straw; corresponding week last year, 397 cars of Hay and 18 cars of straw. There are still quite large stocks of Hay on the tracks and in the depots of the various railroads unsold, but they are considerably reduced from what they were a few weeks ago, and with the present moderate receipts, are being steadily reduced.

The market shows some improvement with a tendency to still better prices. Some cars of fancy Hay sell above our quotations. Rye straw is steady at quotations. There is very little demand for oat straw.

THE CENTURY DICTIONARY

comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to

THE CENTURY CO., 33 East 17th St., New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month,** and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions,** arranged for practical use; timely hints to **Housekeepers;** cheering and helpful talks with **Mothers;** valuable information for lovers of **Flowers;** a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

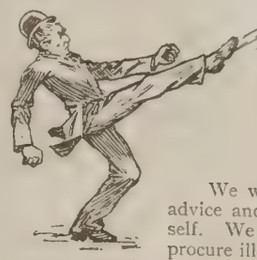
Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.



The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other RAW material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

CONDENSED CREAM?

There is a brand of something, that looks like condensed milk, sold in cans, which the manufacturers claim is condensed cream. To condense cream the same as milk is condensed is an utter impossibility, because of the excessive amount of fat contained in cream. Cow's milk contains, on an average, 3.86 per cent. of fat. The cream of cow's milk contains 35 per cent. Fresh condensed milk without sugar contains, on an average, about 15 per cent. of fat, while that preserved with sugar contains btween 11 and 12 per cent. of fat. What we call fresh condensed milk, without the addition of sugar, is the kind of milk sold in bulk from wagons in the large cities, and will not keep any longer than ordinary uncondensed milk. If this kind of fresh condensed milk is put in cans and exposed to a high temperature, it is sterilized, and will keep until the can is opened and exposed to the air, when its keeping qualities are again reduced to those of ordinary milk. But in this sterilizing process the fat globules in the milk are broken up, and thus the entire character of the milk is destroyed. While fresh condensed milk is certainly superior to and richer than the best ordinary milk for use in coffee, it is only a substitute for cream and not cream. It is therefore clear that any manufacturer who puts up fresh condensed milk exposes it to a process which takes from it all the characteristics of milk and sells it for cream, and at the price of cream is selling to the innocent purchaser a different article from what it is, and perpetrates a gross fraud. We have been informed that the Pullman and Wagner palace dining cars use this stuff as condensed cream. They may learn from this article what its true nature is, and thus be enabled to save themselves from paying an inequitable price for an inferior article and imposing on their patrons.

A PATENT CENTENNIAL.

A national convention is announced to be held in Washington City from the 8th to the 10th of April, to celebrate the advent of the second century of the American Patent System. It appears at the first view to be a curious object for attracting national discussion, but it is promised the personal co-operation of the President and Vice-President, the Secretary of the Interior, Commissioner and Assistant Commissioner of Patents, the ex-Commissioner of Patents, Congressional Committees of Patents, United States Senators and representatives, prominent public officials and representative inventors and manufacturers throughout the country, all of whom have given their adhesion thereto, and from whom active participation and support are assured. The objects of this convention are, among others, to organize a national association for the mutual benefit of inventors and manufacturers; to secure a proper recognition of the rights of inventors; to operate to secure the perfection of the patent system; improvement in the practice of granting patents; increasing the protection afforded inventors and the owners of patents; removing existing obstacles in the way of a more thorough administration of the Patent Bureau; obtaining a more thorough knowledge of, and improving the great advantages already derived from, the patent system by all the varied industries of the country. There will be three meetings held each day of the convention, presided over by the President, the Secretary of the Interior, the Secretary of the Smithsonian Institute, the President of the National Board of Trade, and the American Philosophical Society, and other influential and prominent men, at which addresses will be delivered, by men of eminence and national reputation, on important topics, affording a vast fund of information hitherto generally unknown or unappreciated. As showing the character of the orators and their themes, it may be mentioned that Justice Blatchford, of the United States Supreme Court, will speak on "A Century of Patent Law;" Hon. Benjamin J. Butterworth, Chairman Committee House of Representatives, on "The Effect of our Patent System on the Material Development of the United States;" Senator Daniel, on "The New South as an Outgrowth of Invention and the American Patent Law;" Professor Mason, on "The Birth of Invention;" the Commissioner of Patents, on "The Birth and Growth of the American Patent System;" Senator Platt, on "Invention and Advancement;" Hon. Edwin Willits, Assistant Secretary of Agriculture, on "The Relation of Invention to Agriculture;" Hon. Carroll D. Wright, Commissioner of Labor, on "The Relation of Invention to Labor;" Professor Cyrus F. Brockett, on "The Effect of Invention on the Progress of Electrical Science;" Octave Chanute, President of the American Society of Civil Engineers, on "The Effect of Invention Upon the Railroad and Other Means of Inter-Communication;" Professor Thomas Gray, on "The Telegraph and Telephone; Hon. A. R. Spofford, Librarian United States Congress, on "The Copyright System of the United States."

STRICTER LAWS.

No honest person can consistently object to a law which compels every manufacturer of a food product to state on the label every ingredient in the package which is not usually found in that particular kind of product. For instance, it is admitted on every hand that baking powder should be composed of cream of tartar, bicarbonate of soda, and just enough flour or starch to preserve it. If one manufacturer claims that by the addition of carbonate of ammonia he can make a better and more wholesome baking powder than his neighbors can without the addition of that unsavory ingredient, he should have the courage of his opinion and state that fact on the label. Thus the Royal Baking Powder Company, in the honesty of their purpose, should put on their labels, "This model baking powder, which we claim is the standard by which all other baking powders are to be judged, is superior to any other because it contains ammonia." They might add in an exuberance of candor, "We add ammonia, which is much cheaper than cream of tartar, not as an adulterant, but to increase the leavening power of our baking powder. It is a natural product, made from gas-house refuse, and was originally made from the drippings of stables. This is why we set ourselves up as the standard, and also why more scrupulous manufacturers cannot compete with us. It may be considered a drawback by thinking housekeepers, but we more than make up for this by the unparalleled veracity of our advertisements." At all events, the law assuredly should compel the Royal Baking Powder Company to note the fact that they use ammonia in their baking powder on their labels. If such a law were introduced, however, in any State legislature, the Royal would move heaven and earth to defeat it. This may be a useful hint to some legislators. The fact remains that such a law is needed, and such a law not only applying to ammonia, but to every adulterant, will surely be introduced in

every legislature in the United States, and the voice of the press and public opinion will be strong enough to pass it. The time has arrived for establishing more legal safeguards about our food.

CONDENSED MILK SWINDLES.

If a can of condensed milk costs sixteen cents, and contains sixteen ounces net, it follows that a can containing but thirteen and a half ounces net at the same price, is two and a half cents too dear, both being of the same quality. If the can containing but thirteen and a half ounces is sold for fourteen cents, it is really one-half cent dearer than the full weight can. The propositions just stated really exist. In fact, we know of but two concerns who put up full weight cans, one of these does so with only one of its brands, the other with all their brands. All the rest are deliberately swindling the consumer. The flimsy excuse that they do not claim to put sixteen ounces of condensed milk in their cans is not worth considering, because they make their cans of such shape and thickness that they really look to the inexperienced purchaser as if they contained as much or more condensed milk as the full weight cans. The grocer who buys these short weight brands knows full well what they are, and as he pays less for them than for full weight brands and sells them at a higher price he is a party to the swindle. Two and a half ounces of condensed milk stolen from the consumer out of every supposed sixteen ounces, means an additional profit to the swindlers of nearly sixteen per cent, a larger profit than can be made in the business by legitimate means. The only way in which the purchaser can avoid this imposition is to refuse to purchase any condensed milk which has not a guaranty of the net weight of the contents plainly printed on the label. The AMERICAN ANALYST is having prepared a table showing the net weight of the contents of the various brands of condensed milk usually sold by retail grocers, which, together with the retail price and the actual cost per ounce, will be published at an early date for the benefit and guidance of our readers.

ADULTERATION OF FOOD.

THE ONE WAY IN WHICH THE STATE COULD PROVIDE A REMEDY.

Our desk is covered with appeals from correspondents in all parts of the country, says the *Journal of Commerce*, for help to prevent the frauds now practiced in the adulteration of food. The evil has grown to be one of enormous magnitude, and it is difficult to devise any effective method for its suppression. The very class that now makes the loudest complaints have been largely instrumental in making such adulteration profitable. When greedy schemers first began to mix cheaper or worthless substances with the genuine article in supplies for the table, there were very many honest manufacturers and dealers who refused to sanction the fraud, and still put up and offered for sale the labeled product in its purity. If their customers had stood by them in this contest the rogues would have gone to the wall and honesty would have triumphed. But the head of the household, or his good wife who did the marketing, would not pay the few cents extra demanded for pure butter, pure coffee, pure pepper, pure mustard, pure ginger, pure hogs' lard, pure olive oil, and was too often found willing to accept a mixture at the lower cost. A grocer once called our attention to his shelves, on which was a row of pure spices he had held in stock for a year with but few missing packages, while he had
f mixed and almost worthless trash be-
e had at lower rates. We have no doubt
gave way too soon, and that if they had
ould have brought the public round to
f the unadulterated article without re-
t. The difficulty of effecting a reform through the returning good sense of the customers at this day is in the fact that the articles in question are mixtures, and customers have no ready means of testing the quality and thus securing the pure, which a very large majority of the people most certainly desire. In coffee the housewife may purchase the bean in its green state or already roasted and grind it herself, as the mill will cost but little ; but in spices, lard, oil, baking powder and the like the buyer has no method of detecting the fraud at the moment of trading, nor even when the use has been found to be unsatisfactory can he always tell what it is that has contributed to that result. Bicarbonate of soda and cream of tartar, with flour or other farinaceous substances enough to keep the acid and alkali from neutralizing each other by unobstructed contact, make the model baking powder. Ten per cent. of flour is sufficient to preserve the materials for use, but why not add 20, 30 or 40 per cent. of the cheaper product when all are white and no mere visual inspection can detect the increase? It is true that with such addition it will not have quite the same yeasty power as the standard article, but only an expert can detect the difference. Greed does not stop here, however. Ammonia, tartaric acid or alum will produce a result similar in most results to the soda and cream of tartar, and cost far less ; hence they are largely used. Advertising in the papers, and all over the fences, stairs, blank walls, and other vacant places about the city, costs a great deal of money and lessens the profits of the compounder, and by using less expensive ingredients he can recoup the loss. It is here, and here alone, that the interference of the law can be defended. Where the customer can detect the adulteration at the time of purchase, it is only his own cupidity that betrays him. He takes a poor article because it is cheaper and as he hopes will answer the same purpose as that which is pure and would cost more money. But when the mixture is of such character that it cannot be detected by inspection, and especially where the articles used as adulterants are noxious or in any way injurious to health, it would seem to be within the province of legislation to provide a remedy. How shall this be done? In what way may the law properly interfere to protect the innocent from the guiles of the deceiver? Hitherto the efforts in that direction have been confined for the most part to restraints upon the producer. This has been resisted on the ground that it interfered with valuable industries. The pure hog's lard, say the mixers, will not do to ship, will grow soft in any climate, and becomes utterly worthless in a hot country. Therefore the product of cottonseed and the various other hardening compounds that are added are really, as they insist, a benefit to mankind. Oleomargarine, according to the patentee, is a blessing to the race. Beef fat or any greasy material "digested with a pig's stomach," as the patent provides, and deprived of its repelling odor, is represented as not only a desirable addition to the world's products, but is far healthier than poor butter that comes from the dairy. Therefore the producers churn it with a little cream to make it taste like the product of cow's milk, and sell it, not only for boarding-house purposes, where it is largely consumed, but even for the tables of private families, many of whom depend on unscrupulous grocers and cannot detect the imposition. It seems to us that a way might easily be provided to give these ingenious and enterprising manufacturers the full benefit of their industrial undertaking, and at the same time defend the people from undetected fraud. Let the law insist that every one who puts up any food product for market shall stamp it with his name and address, and affix a true statement of the contents. If he wishes to keep the proportions a secret, he may be allowed that reserve, but compel him, under a sufficient penalty, to describe by its proper title every article contained in the mixture. The committee of Congress, in their investigation, found that a large quantity of a manufactured article was put on the market labelled "Pure Family Lard" which had nothing in it that came from the hog. If the actual contents of every package had been printed or branded thereon, and the people had chosen to purchase it, no one would have a right to interfere. Every package of baking powder should have on it the name of the ingredients. If the consumer has no objection to tartaric acid or alum, it will not hurt the sale to have the fact of their presence duly inscribed. Instead of "Pure Old Java" on a package that purports to be ground coffee, let the inscription read "A mixture of coffee with chicory, roasted wheat and beans, split peas, rye and potato flour, mangelwurzel, acorns, lupine seeds, ground date stones, scorched cocoa shells, licorice and burnt sugar," or so many of these as have been added. Instead of "Pure Ground Pepper," we might have "Pepper leaves with mustard, wheat flour, sago, charred wood, chillies, rape seed, potato, manignette, chicory, rye, olive stones, bone dust, and marine salt." We have not exhausted the list of things actually found as substitutes or adulterations of pure pepper, but this would do for a beginning. For mustard, the label might read, "Ground mustard mixed with wheat flour and colored with turmeric or Martin's yellow demitro naphthol." If this did not suit we have seen cayenne pepper, gamboge, potato starch, pea flour, radish and rape seed, linseed meal, yellow ochre, chromate of potash, plaster of Paris and clay in a package called mustard. We have named nothing that is not common in the packages of these so-called "spices." No manufacturer ought to object to this test. If his added ingredients are innocuous, and the people are likely to esteem them, it is only fair to let the buyer know where he can get them. If he purposely or "inadvertently" omits anything from his descriptive list which the package contains, let him suffer for his want of memory or intended fraud. For table use the greater portion of the golden fluid now offered in beautiful glass bottles with showy labels as the product of the olive might more truthfully be described as "Pure cottonseed oil for salad purposes." Why not compel the producer to print the truth on his ticket? Then those who wish to patronize this "great and growing industry," as it has been recently described, would know exactly what they were eating, and no one be wronged in the matter. We suggest that this would solve some of the vexed problems, and remove every ground of complaint from the manufacturer who prepares these adulterated or substituted products, and insists that he is contributing to the sum of useful inventions.

RATIONAL THERAPEUTICS.

RELATIONS OF THE MODERN HOMŒOPATHIST TO THE MEDICAL PROFESSION.

The term homœopathist does not any longer convey any definite idea of the school of practice followed by the individual to whom it is applied. If it is applied to one of those conscientious old fogies who still sticks to the Hahnemann idea of *similia similibus curantur* with its high potencies it may be correct in one sense, but this class will soon be of the past, and therefore is hardly of sufficient importance to deserve mention. If applied to the very large majority who cling to the name and profess to practice its tenets, because it catches the popular fancy, it is a misnomer, for, judging from their organs, they use the most powerful allopathic remedies, and employ largely the much advertised pharmaceutical preparations of the day. Another and rapidly increasing class to whom the name is applied, is that large and influential number who would be more correctly designated as physicians. They are conscientious, educated, scientific, progressive and use every thing that experience has shown to be curative. This class are the pioneers who are bravely and steadily paving the way for the abolishing of the different "schools," who believe in the highest attainable education. Changes have already taken place, as in the change of the *New York Medical Times* from "a jour-

nal for homœopaths" to "a journal for physicians," with the advice from its learned editor, Dr. Egbert Guernsey, to all graduates of homœopathic colleges to drop the name "homœopath" entirely; and as in the late announcement of the Cleveland Homœopathic Medical College that hereafter the United States Dispensatory will be used as a text-book, and that the lectures upon materia medica will include all the principal drugs given in it! Much has also been done towards meeting this liberality of these physicians, half way at least, by those who were always known as the "regulars" or "old school physicians," thus the hostility of the average doctor to the disciple of Hahnemann is not half so pronounced as was the case a decade ago, as is evidenced by the promptness with which certain prominent surgeons respond to the call to operate for homœopathic practitioners; again, the rapid increase of "new code" men even outside of New York, is significant of a change; so, too, is the fact that many post-graduate schools admit graduates of Hahnemann colleges, and still more is the fact that an ex-president of the American Medical Association has openly avowed his practice of consulting with all legally-qualified practitioners whether "regular," "homœopathic" or "eclectic," and absolutely no notice of it has been taken by that association! But even more may be done. It should be the duty of every teacher of therapeutics to carefully select the good things of homœopathy as well as of eclecticism and present them to his students. This may not be practicable at this time, but it will become so at no remote date; for physicians are more broad minded in their investigations and the "old school" cannot deny that they have gained much by the work done by homœopathists, for instance to look more closely at the symptoms present in a particular case, and by means of "specific medication" (derived in great part from the "eclectics") to combat those symptoms before they become dangerous; and still better have learned simplicity in the administration of drugs; one of the rules of homœopathy is "the single remedy"—the old school have been giving too much medicine, and were centuries in recognizing it. But polypharmacy is giving way to the rational therapeutical application of remedies—the draughts and potions, the nauseous pills and bitter solutions are being superseded by simpler, pleasanter and more efficacious methods of drug administration. If this tendency toward liberalism continues, homœopathy will soon vanish from the earth, and eclecticism will go simultaneously. There can be no doubt of this—the handwriting is on the wall, and the obliteration will be by the broadening process.

CONVERSATION CLASSES.

EVIDENT NEED OF THEM FOR YOUNG LADIES IN SOCIETY.

Some two winters ago a cultivated and enterprising woman, who wished to turn an honest penny, looked about for an opportunity of exercising her several pretty talents with profitable results. With almost the inspiration of genius she concluded to hold classes in conversation. On first thought, her friends were greatly amused; and yet, when her explanation was made, they began seriously to wonder how society had moved along satisfactorily without the aid of lessons in conversation, says the *Illustrated American*. The woman's idea was clever, indeed. "People," she said, "are taught to read, write, walk, eat, dance, play and sing; but rarely are they taught to use their tongues, in everyday speech, with ability and discretion." She, therefore, proposed not only to lecture, but also to give practical lessons to the shyly or stubbornly-silent woman; the woman awkward in conversation; the woman ambitious of getting acquainted with her fellow-beings, yet ignorant of the graceful turns of speech; the woman afflicted with a harsh voice, unpleasant accent and untuneful and ill-timed laughter. Young women she hoped to gain as her pupils—girls about to enter society, or those suffering from personal defects of manner, which, if corrected in youth, would not in after years become objectionable and irremediable characteristics. Carefully the simple curriculum for the study of this pretty accomplishment of conversation was prepared. Some friends, partly from curiosity and partly from careless generosity, joining the class, shortly converted it into a gossip-tea, and the little conservatory of conversation lost its object and its standing, and very quietly died of sheer lack of life. Yet by no means has this result proved that the gentle art cannot and should not be taught and learned on the original plan proposed, for when not very long ago mention was made of the unfortunate little class, letters came from individuals anxious to know if it was still in existence, and how they should make application for instruction. These letters were straws showing that in any of our big cities an intelligent woman, fitted for the task by education and breeding, could by skillful management reap handsome profits from an employment full of interest, importance and dignity.

AIR NAVIGATION.

WHAT THE "SCIENTIFIC AMERICAN" SAYS ABOUT THE PENNINGTON AIR SHIP.

The rapid strides which of late have been made in the practical applications of electricity have prepared the way, in the public mind, for the ready acceptance of almost any new and striking proposal. In the popular belief the flying machine is next to an accomplished fact, and no very great surprise probably would be occasioned if the announcement were to be made to-morrow morning that a line of air ships had commenced to run between Chicago and New York. We are sorry, however, to be obliged to dash the hopes of a confiding public by the cold, unfeeling statement that the art of flying in the air by mankind has not yet been learned nor the means thereto invented. Looking at the subject from a practical point of view, our glorious people are likely, for some time to come, to be confined in their locomotion to the actual earth's surface, and to railway cars that make only from fifty to seventy-five miles an hour. But there are various schemes for air flying, and they look fine on paper. One of these paper enterprises has been widely made known in Chicago. It is styled the Pennington air ship. Twenty millions of dollars is the modest amount of the capital. A few of the shares have been reserved for sale to a hungry public. Those who have a dangerous surplus of cash on hand can promptly reduce it by investment in this deceptive and visionary scheme. Mr. E. J. Pennington, of Mt. Carmel, Ill., the inventor, says: "The main part of the machine is the buoyancy chamber. This in shape is an oblated spheroid, being larger at the centre and tapering symmetrically to a point at either end, and looks like a huge cigar. On the inside of this chamber are two compartments, one is a receptacle for gas and the other is used as an engine-room. The engine that occupies this room is a three-cylinder rotary and propels the large wheel in front of the ship. The fuel that supplies this engine is gas and is fed direct. The main shaft on this engine is hollow, and the large propeller is keyed directly on to it. This shaft is made hollow to allow the air to pass through it in the cylinders to keep them cool. On the top of the buoyancy chamber is placed the sail. This extends its full length and can be manipulated so that the currents will act to propel the ship as it does a sailing vessel in water. Attached to this sail is the rudder that guides the ship either to the right or left, and underneath this rudder is the tail; this tail is patterned after a bird's tail, and is used to raise or lower the ship independent of the propeller wheels at the sides. On the sides of the chamber are placed the wings. These wings are so made that when the ship is descending they improvise themselves into parachutes, which makes the descent gradual. On each of these wings are placed two propeller wheels, for raising and lowering the ship. Underneath the chamber is hung the cabin, and underneath the cabin are placed the storage batteries. The weight of these batteries makes them useful for ballast, and are used to keep the ship in the proper position. On the four corners of the cabin are the stands, or brackets; these are cushioned, and when the ship alights not the slightest jar is perceptible. To explain how the ship is started, we will suppose a trip is about to be made; enough gas is put into the buoyancy chamber to make the whole ship weigh nothing, the propellers are gradually started and the ship gently rises from the surface of the earth until a height is reached to clear the tree tops and buildings in the course to be traveled. If there were any mountains or hills to clear, a uniform height could be attained at the start, so that a straight course to the destination could be made. When it is desired to make a landing the ship's bow is headed to the wind, and the rudder set so that the current of air will place the ship at the desired point, the same way that a landing is made by a steamboat. The whole construction being of aluminium makes it lighter and stronger than any other material; that is, it will take less gas to raise it, and the great tensile strength of this metal will allow it to be rolled thinner than silk and still retain as much strength as steel three times as thick. The gas engine and all other mechanical devices on this ship are patented, which gives the company the exclusive benefit of their use for a long time." The use of the storage batteries is not explained; probably, however, they are for lighting the cabin. Where the gas is to come from to work the gas engines is not set forth. To assist in floating this stock-jobbing enterprise the promoters have made what they call a practical demonstration of the invention on a small scale, which is now exhibited in the exposition building, Chicago. This little side show consists of a thirty-foot cigar-shaped balloon, inflated and raised by gas, and worked by means of a fan propeller, operated by a small electric machine carried below the balloon, which electric machine is worked by means of a wire extending from a battery on the ground. This float is tied to a string, and when the current is turned on, the machine moves slowly around in a 50 ft. circle in the still air of the building. It is said to be interesting to see this cigar balloon move; but as a demonstration of anything new or promising in the way of aerial navigation it is without value.

USEFUL HOUSEHOLD ARTICLE.—After a housekeeper fully realizes the worth of turpentine in the household she is never willing to be without a supply of it. It gives quick relief to burns; it is an excellent application for corns; it is good for rheumatism and sore throats. Then it is a preventive of moths; by just dropping a trifle in the drawers, trunks, and cupboards it will render the garments secure from injury during the summer. It will keep ants and bugs from the closets and store-rooms by putting a few drops in the corners and upon the shelves; it is sure destruction to bedbugs, and will effectually drive them away from their haunts if thoroughly applied to all the joints of the bedstead, and injures neither furniture nor clothing. A spoonful added to a pail of warm water is excellent for cleaning paint.

LIFE LENGTHENING.—Human life is estimated to have lengthened twenty-five per cent. during the last half century. "The average of human life in Rome, under Cæsar, was eighteen years," says Dr. Todd, of Georgia; "now it is forty. The average in France fifty years ago was twenty-eight; the mean duration in 1867 wes forty-five and one-half years. In Geneva, during the thirteenth century, a generation played its part upon the stage and disappeared in fourteen years; now the drama requires forty years before the curtain falls. During the golden reign of good queen Bess, in London and all the large cities of Merry Old England, fifty out of one thousand paid the last debt to nature yearly, which means that instead of three score and ten they averaged but one score. Now in the City of London the average is forty-seven."

ANIMAL, MINERAL AND PLANT.

CHARACTERISTICS OF THE KINGDOMS OF NATURE.

According to the old school-books, all nature is divided into three kingdoms—the Animal, Vegetable, and Mineral. This is a very convenient classification, as no one is likely to mistake a mineral for a plant or animal, or—in the higher and more familiar forms at least—to confuse a vegetable and animal organism. A more rational and strict classification would be to distinguish two kingdoms only—the organic and inorganic, or the living and dead forms of matter; for, as was shown by Professor Stoller in the January number, the line between amimals and plants is by no means strongly marked, and among certain lower forms of life it is often a puzzling question to decide whether they should be considered as vegetables or animals. An animal may be broadly defined as a vitalized aggregation of matter capable of motion and reproduction, and endowed with perceptive faculties which enable it to take cognizance of the outside world, and sustaining the chemical process of life by nutritive material obtained from external sources; while a vegetable is fixed to and grows from a certain point, and has no perception of outward conditions. These definitions are evidently very faulty, as certain plants—like the ferns and seaweeds—produce microscopic organisms endowed with the power of motion; while the familiar growth of a potato-sprout towards the light, and the motions of the insectivorous plants, seem to show that they are sensitive to external impressions to a certain degree. The most characteristic difference between a plant and an animal, and one affording perhaps the best means of classification, is a chemical one. Animals, as a rule, are oxidizing machines; they take in nutriment prepared for them by vegetables—either directly or after passing through some intermediate animal organism—and oxidizing or burning it in their bodies, throw it off in the form of water and carbonic acid gas. The vegetables seize upon these waste products of animal life, and by the aid of the sun's radiant energy, remove the oxygen and build them up again into nutriment for the animals to oxidize in their turn. The plant reduces; the animal oxidizes; and this while not a perfect distinction, is as good as any that we have. The yeast plant—if it is a plant—is one of the most familiar apparent exceptions, for, feeding as it does upon the highly complex molecules of glucose, it breaks them up into the simpler and more highly oxidized substances, alcohol and carcobonic dioxide, after the habit of a true animal. In the mineral or inorganic kingdom, however, there is no uncertainty. The presence of vitality in matter is unmistakable, as is the presence of organs adapted to special purposes of nutrition or reproduction. The moment a plant or an animal dies, it practically passes over to the mineral kingdom; its organs cease to exercise their functions, and, if left to itself, the chemical compounds of which it is composed are soon changed into simpler and permanent forms. While the mineral kingdom is thus a very broad one, we may consider as a more characteristic type a crystalline body—a lump of salt, for instance—for there are few inorganic solids that are not crystalline in structure to a greater or less degree. Iodine, for instance, always occurs in well-defined crystals; while in the best qualities of glass it is not at all apparent, although a tendency to crystallization is always present. If we allow a saturated solution of a chemical compound to slowly evaporate, it returns to the solid condition in regular geometrical shapes. In the case of common salt, the form is that of a simple cube; other substances—tartaric acid, for instance—take very complicated forms, which require considerable mathematical knowledge to understand. By proper precautions we can cause our salt crystals to increase in size from the minute points which first appear, to cubes of several inches. In this sense the crystal grows like a plant or animal; but how different is the result! The salt crystal is nothing but a crystal from its very beginning. The largest and smallest are identical in everything but size; it possesses no function but that of simple accretion, and, of course, has no specialized organs, either for perpetuation or reproduction. If left undisturbed it will continue in existence for ever, neither increasing nor diminishing in size, nor reproducing other similar forms. In this sense the crystal may be said to be immortal. And yet there are some curious analogies between the crystal and the animal. Both have a definite and—within certain limits—an unvarying shape. It is not an entirely absurd supposition that the same forces which determine the unvarying shape of the salt crystal may also cause each living organism to resemble its predecessor. Although crystals have no distinct organs, they have a differentiated structure—as is shown by the phenomena of dichroism, double refraction, and the thermo-electric properties of tourmaline and other minerals. A curious imitation of the phenomena of reproduction may even be observed in supersaturated solutions of certain salts, like sulphate of soda, which remain perfectly clear until the magic touch of a minute crystal of the same substance causes them to be converted into an almost solid mass of similar crystals. Of course, these analogies are merely fanciful. The gap between living and dead matter is, as far as we know, an impassable one, and beyond our comprehension. But the forces of Nature are always in existence, and act upon all forms of matter alike; and it is not entirely irrational to surmise that in time to come we may discover a closer connection between the three kingdoms than is now evident. If we admit that the same force which determines the form and structure of an amœba determines also that of a man, it is not beyond the bounds of possibility that the wonderful structural phenomena of inorganic crystals may be conditioned by the same natural law, of which at present we can hardly do more than perceive its existence.—*Pop. Science News.*

HOME LIFE IN SPAIN.

THE SERVANT GIRL QUESTION IN CASTILE.

A correspondent—manifestly feminine—of the *Boston Transcript*, writing from Madrid under date of February 23d, discusses the question of domestic servants in that land of sun and flowers as follows:

Perhaps your lady readers would like to know what Spanish domestics are like, since the problem of the day is how to get good servants. Housewives all over the world are deeply concerned over the question and especially in the United States, where a good servant is daily getting to be more rare. Spanish domestics are in many ways unlike those of other countries. They are sometimes downright bad, as anywhere else; but there is a fair, average class, who, if not exactly saints, are at least free from the new-fangled notions of equality, division of labor and similar ideas, which have not yet had time to enter their heads. These know that they are servants and are content with their condition in life; yet there is a quiet dignity and pride about them which superinduces a feeling of kindness and makes you treat them well. They are easily managed by gentleness and just enough firmness to show, without driving them too hard, that you intend to be obeyed. They are, however, apt to take their bit between their teeth, and get to be presumptuous, meddlesome, argumentative, nay insolent, if any degree of familiarity is allowed. They are not overtruthful, generally; yet, if you come across a fair sample of a domestic as you often may, it is best not to show any mistrust. You can leave your purse and jewel case open without fear of loss; not only will they respect your property but frequently they will defend it and defend the trusting mistress with a dog-like fidelity that is really touching. At other times their devotion to the household interests is carried too far, even to the verge of officiousness, especially in their dealings with shopkeepers. Then again your Spanish servant, when she has been long in a house thinks and speaks of you and your wordly goods, and in every way acts, as if she had a vested right in the same. It is "our children," "our furniture," "our cats," "our house," and "we are going to travel," and "we intend doing this and that," etc. A servant in Spain is paid by the month; she can be sent away, or herself give warning to the family at a moment's notice. The law, it is true, requires that fifteen days' notice should be given on either side, but this practice is never enforced, as Spanish temper is too quick to allow of people living under the same roof to abide together when they have once disagreed. I wonder what an English or an American housemaid would say if she were told that besides doing all the housework, she was expected to attend to the washing, the ironing, even that of master's shirts, the mending, and to answer the door; all this a Spanish "doncella" has to look after for six dollars a month, which is accounted good wages. She rises at dawn, and after serving up the early tea or chocolate, ties a large handkerchief round her carefully combed hair and sets about the housework. She bustles about for hours, until everything looks neat and tidy. She takes great pride in making the beds, every mattress is turned and not a crease must be seen in the counterpane. By twelve o'clock she is ready to wait at table; she has been on her feet since sunrise, and only sits down at 1 P. M. to her well-earned lunch. During the whole afternoon she either irons or sews, and when night comes it is no wonder if she has little heart for a book, or if she falls asleep on her chair, waiting until the mistress comes home from the ball or the theatre. Then she is sent to her bed. The Spanish cook or "cocinera" is quite the reverse of the "doncella," for she is the laziest creature in creation. She does her cooking, goes to market every morning, and cleans the kitchen, once a week, on Saturdays. In some houses she has to do the washing, but this is only the case in a small family. A cook in Spain earns from $6 to $10 a month, according to her expertness. As I have said she does all the marketing, every morning she waits on her mistress for money and orders, and every evening—as few know how to write—the mistress jots down her expenditure. The cook is a queen in her kitchen, and the rest of the domestic servants look up to her for their victuals, as it depends on the respect shown her whether the meals are good or bad. When the servants dine she deals out their portion, and never thinks of sitting down until they are all served. Spanish servants have simple tastes, but they must be well fed. In the morning they each have an ounce of chocolate prepared in milk and a roll of bread. At lunch they expect a dish of greens—beans, potatoes, or other vegetables—cooked after the national fashion, and a dish of meat. The dinner consists of a plate of soup, the abundant and nourishing "puchero," and whatever is left from the table, with either fruit or salad. They rarely drink wine, but must be allowed as much bread as they can eat. Of Spanish female servants there is one that rules the roost. She is the tyrant of the household and the dread of masters and menials alike. This is the "ama" or wet nurse. Servants will oftentimes throw up a good position as soon as a baby is born, in order not to have to put up with the "ama." She makes her sway felt from top to bottom of any home. Nor must her temper be ruffled, as baby might suffer in consequence. Her appetite is ferocious; it is never satiated. She is totally unfit for all work beyond that of carrying her charge. She has a fondness for finery so developed, that she either sulks or threatens to leave if she is refused a dress or ear-rings finer than those worn by the "ama" next door. As poor, little, Spanish babies are not strong, their very lives depend on the proper nursing of these healthy, brutal women; so that a young mother will put up with anything rather than run the risk of losing her "ama." A Spanish man-servant is, indeed, a curious type. In grand, aristocratic houses, the footmen and flunkeys are the same all over the

world ; but the "majordomo," or butler, is a person to be feared and respected in his black cloth and silver chain. He is very honest if you trust him, and he does his work splendidly. He burnishes the silver plate until it shines like the sun at noon time, and he brushes his master's clothes until all the nap is taken off. But it is in minor questions of style or tact that a Spanish man-servant of this class is deficient. He can never be made to stand up straight on his legs ; his invariable rule is to assume a lounging gait—to lean upon a table or against a wall, while he condescends to receive your orders. He is, however, so good-natured, and grins so heartily at any remark overheard as he waits at table, that you cannot find it in your heart to get angry with him. He will at times volunteer a reply to a question put by you to a guest ; and if no guests are present he has been known to join in the family conversation. He is exceedingly fond of gorgeous neckties and pea-jackets ; and if you go the length to bestow a "frac" or dress-coat upon him, he looks so awkward and ungainly when he puts it on that you are fain to regret the generous impulse which prompted you to such munificence. You sigh to see him once more in his old clothes. This is a sort of man-servant everybody has in Spain ; the poor fellow is badly paid, for he never earns more than thirty or forty "pesetas" a month. So many Spanish families are in one way or another connected with the army, that they frequently secure the services of a soldier. Young men who enter the ranks as conscripts every year are eager to secure the berth of "asistente" in an officer's family. They at once become the Jack-of-all-trades or factotum in a house. Indeed, it is wonderful to see with what cheerful alacrity these lads undertake the most extraordinary duties of a man. Not only will they do anything expected from an ordinary servant, but you may see them take the children to school and carry their books and slates for them without relinquishing their military garb. They may even be seen with the tot's provision-basket and his toys in their hands. It is even more amusing to see him as one of a party of nurses and small children who are wildly fond of their soldier-nurse. A Spanish family regretfully parts with their "asistente" when, at the end of two years and six months, he receives his discharge in a small tin case, the common solder's "baton," which takes him back to his native village.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEAT.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, white-fish, trout.

VEGETABLES. — Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress.

FRUITS.—Apples, bananas, oranges.

PRACTICAL RECIPES.

VEAL PUDDING.—Cut into small slices some cooked lean, veal and some ham and season them highly with chopped parsley, sweet herbs, pepper, salt and a little grated lemon rind. Line a pudding dish with a thick crust made with suet, fill up with the meat, pour some gravy over it, cover with a crust, pinch the edges well together, cover with a cloth and tie firmly, put it into boiling water and boil until done.

MACARONI OMELET.—Boil some macaroni and when done cut into pieces of an inch each, season highly with butter, parmesan cheese and tomato sauce, stew them together for a moment. Make an omelet of the size desired, and when it is set fill the centre with the macaroni.

CURRIED BEEF.—Cut some cooked roast beef into thin slices ; slice and fry one onion in butter ; mix smooth a large tablespoonful of curry powder, with a tablespooful of butter, a cup of beef gravy and salt and pepper. Put this to the fried onions, add the beef and cook gently for a few minutes. Serve very hot.

PEACH FRITTERS.—Make a good batter, allowing five eggs to a pint of milk. Take some fresh peaches—or canned ones if out of season—sprinkle them well with sugar, dip a piece in the batter and fry in boiling lard until it is a fine brown. Drain and serve with powdered sugar.

BROWNED SWEET POTATOES.—Boil some fine sweet potatoes until done, peel and split them ; put them in a flat pan and baste them well with some water and melted sugar ; put tiny bits of butter over them and bake until they are a rich brown.

ITALIAN SAUCE FOR FISH.—Put some lemon, thyme, parsley, and mushrooms, shred small and fine into a stewpan, with a little butter and a clove of garlic ; set it on a moderate fire, and as soon as the butter begins to fry, pour in a little consomme, and let it stew till pretty thick, then take out the garlic, and add some butter sauce and a little lemon juice.

LAMB CUTLETS.—Have your butcher cut some cutlets from the best end of a neck of lamb two or three inches from the top of the bones. Get him then to shape the cutlets for you. Dip them in egg and crumbs and fry them. Make a bed of green peas in the centre of your meat dish, pile the meat around it and serve, or else serve with tomato sauce.

GINGER SNAPS.—Two cups molasses, one good cup butter, one and a half tablespoonful of ginger, one teaspoonful cinnamon, a little salt. Heat all these together so that they may become thoroughly incorporated. Mix half a teaspoon baking soda in a very little warm water. When the molasses has cooled pour this into it. Beat up and pour onto a quart of flour. Mix well, and add more flour as needed. Roll out very thin, and bake for a moment in a hot oven. Use as little flour as possible, but the thinner they are the more dainty.

NUTRITION.

POSSIBLE TEMPORARY SUSPENSION OF THE VITAL FORCES.

A professional "faster," an Italian named Succi, has lately performed the feat of obstaining from food for a period of forty-five days, taking nothing into his stomach but fresh water and a secret "elixir" which appears to be simply a preparation of opium. He kept up his strength remarkably well under the ordeal, taking a horse-back ride on the fifteenth day of his fast and daily exercise thereafter. At the beginning of his fast Succi weighed 147¼ pounds, and at the completion 104¾ pounds—a loss of 42½ pounds, or less than a pound a day. He was constantly watched by a committee of thirteen physicians, and there is little doubt but that the fast was a genuine one. It will be remembered that about ten years ago one Dr. Tanner created a great sensation by abstaining from food for forty days ; but Succi has far exceeded this, although the popular taste has become somewhat weary of professional fasters, and comparatively little interest was excited by this really wonderful test of endurance. Although such experiments are not of the slightest use, and only serve to give a little sensational notoriety to those undertaking them, the fact that the nutritive functions of the human organism can be supended or modified, so that life can be supported without nourishment from outside sources, is of a certain physiological interest. Succi's feat is not a unique one, although very exceptional. The East Indian fakirs and other Oriental religious devotees claim to have the same power, although in the absence of definite proof of their genuineness it has generally been supposed that their alleged fasts were fraudulent ones. The phenomenon of hibernation in the animal world bears a certain analogy to these facts. A bear, after living sumptuously all the fall, will retire to his den on the approach of winter and pass the cold weather in a torpid state, without food, the sluggish vital processes being kept up in the animal's body. At the approach of spring, with a fresh supply of food in the woods, Bruin awakens from his long sleep and reappears on the scene "as thin as a rail," but in good health and spirits and ready to make up for lost time. In the case of Succi, Tanner, and other fasters, all the vital processes seem to be carried on as usual—there is no abnormal sleep or torpor—but it is very probable that their endurance is due to the same cause which supports a hibernating animal during the winter—the power of the body to draw upon the supplies of oxidizable material previously stored up in its tissues, to the exclusion of that from outside sources. The stories of certain East Indian jugglers who have allowed themselves to be shut up in a tomb for several weeks, and have afterwards been resuscitated, are recalled to mind in this connection ; and, as some of them seem to be fairly well authenticated, it is possible that this power may be due to the same abnormal bodily activity which supported Succi through the dreary weeks of his voluntary starvation. The human body is analogous to a steam engine ; both are kept in motion by the oxidation of carbon and hydrogen, and if the supply is cut off the one will die and the other cease to move ; but, as the fires under the boiler may be "banked," and just enough combustion permitted to develop a slight amount of steam pressure, so it is not impossible that the mysterious vital forces may—in some exceptional cases—be held in abeyance, and the small amount of energy necessary for their perpetuation be obtained, for a greater or less time, by the oxiditation of the bodily tissues themselves ; or, in other words, a man may feed upon his own body—a form of cannibalism which is unobjectionable from ethical grounds, although in direct violation of all physiological laws.

CLEANING CITY STREETS.

HOW THE WORK IS SYSTEMATIZED IN PARIS.

It takes an army, almost, to clean, scrub, sweep and sprinkle the streets of Paris. The army of street-sweepers is composed of embrigades and voluntaries. The former are considered as cantonniers, or road-laborers, and are employed the whole day long. All the cares of public street-cleaning fall to their lot, and they do the supplementary sweeping, washing out of gutters, cleaning of public stations, market-houses, etc. The voluntaries are voluntary workers. They are enrolled in brigades. There are about 130 of these brigades, and each comprises a chief, a foreman and about thirty men and women sweepers, the greater part of whom only work in the early morning, either in the cleansing of streets, properly, so called, or in assisting to load the wagons that carry away the refuse. They leave off work at 10 o'clock in the morning, and this is called working by the half-day. The labor begins at 3 o'clock in summer and 4 in winter, and when they work a whole day they finish at 4 o'clock—that is to say, after laboring for twelve hours. The complete service of sweepers comprises thirty-seven chiefs or overseers, 152 foremen, 654 ordinary cantonniers, 2,000 auxiliary sweepers, and 850 men and women who do only half a day's work. Overseers, foremen and ordinary cantonniers are paid monthly—the first 150 to 160

francs, the second 120 to 125 francs, the third 106 francs, and the sweepers are paid, for the work they do, from 64 to 75 cents a day, and 43 to 50 cents for half a day. Out of these small emoluments each cantonnier, no matter what his grade or class, has to pay monthly into a saving bank the sum of five francs, a reserve fund which is remitted to them, however, immediately they leave the service, or it is paid to their widow, children or other heirs if they die in the harness. A further reduction of two francs for the society of mutual succor is made monthly from the wages of those employed in the Bois de Boulogne and in the Bois de Vincennes. The implements used are of two sorts, according to the sex of workers and place of combat. Women sweepers handle the ordinary birch broom or what is known as the "piazzava," made of a sort of vegetable hair of great suppleness and much resistance. Road-scrapers are also larger brooms with which to push the water and mud toward the sewer-opening, and experienced drivers are supplied with sweeping machines. These scrapers and brooms are worth describing, particularly those used along the gutters and on the bitumen and wooden pavements. They have india-rubber bands. This produces perfect adherence, and there is no space between implement and ground that it is to be cleaned, so that water and mud are easily pushed into the sewer. Mechanical sweepers are a cleaning-machine of recent invention, and they are endowed with great power. The annual appropriation for this cleaning and sprinkling, as well as the clearing away of snow and ice, is close to 6,815,000 francs. The sweeping service calls for a total of 5,750,000, and the sprinkling department takes the rest—rather high figures. The city raises its share of this fund by a sweeping tax imposed on house-owners. By the terms of the law, the tariff of this tax has to be revised every five years. The last revised tariff was applied in 1889, and it will remain in force until 1893. It produces 2,956,000 francs, to which must be added the amounts owed by the State and Seine Department as their share of the cost of sweeping. The house-owner tax is 14 cents, 10 cents and 4 cents, according to circumstances. Some only pay four centimes—less than a cent—for each superficial meter of land, the maintenance of which is incumbent. As for the sprinkling, that costs 1,000,000 francs annually, the amount being made up as follows: Carts, 500,000 francs; wages, 300,000; purchase of material, etc., 160,000; sundry expenses, 50,000.

THE COLUMBIAN CYCLOPEDIA.

The Columbian Cyclopedia is the new name and new form of what has heretofore been known as Alden's Manifold Cyclopedia, and which has won great popularity by its high merit, combined with its amazingly low price. The Columbian Cyclopedia will comprise 32 volumes, of about 800 pages each (the Manifold was 40 volumes, of 640 pages each), being about equal in size to Appleton's Cyclopedia, and about 50 per cent. larger than Johnson's. The entire set will contain about 7,000 illustrations. It is very handsomely printed and bound, and, like the Manifold, is almost fabulously cheap, the entire set being furnished in cloth binding for $25,00, with easy instalment terms to those who want them. Of course, subscriptions to the Manifold will be completed in uniform style with the early volumes delivered. Whoever is interested in cyclopedias will do well to secure (free) specimen pages of the Columbian, which may be had by addressing THE COLUMBIAN PUBLISHING CO., 393 Pearl Street, New York, or 242 Wabash Avenue, Chicago.

BRASS BLACKING.—To make a dead-black on brass, for microscopes, etc., mix one ounce of nitrate of silver in a dish with 20 ounces of distilled water. In another dish mix one ounce of nitrate of copper with 20 ounces of distilled water. Mix the two solutions together, dip the brass in the liquid, remove the brass, and heat in an oven until the desired degree of black is obtained.

FRUIT CURE.—Dr. John Hunter was an enthusiastic advocate for the apple cure for gout. Instead of wine and rare roast beef, he enjoined upon his gouty patients the importance of the free use of apples.

REMARKABLE RING.—A lady of Walnut Street Church has presented her pastor with a most remarkable ring, says the Louisville *Western Recorder*. It is probably the only one of the kind in the world. It contains twelve precious stones, the same as were in the Aaronic high priest's breastplate, and arranged in the same order—sardius, emerald, ligure, beryl, topaz, sapphire, agate, onyx, carbuncle, diamond, amethyst and jasper.

BRASS POLISH.—The brass articles that are fashionable just now require careful attention to keep them clean and bright. If not lacquered, rub sweet oil on the flannel, finally polish with a chamois. If lacquered, wash with a soft brush in warm water and soap, wipe well, and set before the fire until perfectly dry. Bronzes are cleaned with sweet oil rubbed on with a brush, then rubbed off with a second brush, and polished with a chamois. Another plan is to plunge them into boiling water until very hot, then wash with flannel and yellow soap, drying carefully with soft rags. If soap and water prove ineffectual, try beeswax dissolved in turpentine, rubbed on and off with clean, soft rags.

CORN SOAP.—Soap of a very good quality is now reported being manufactured from corn. Experiments have shown that a bushel of corn will make two hundred pounds of soap. There is probably no cereal which can be put to more general use than this one, says the *San Francisco Grocer*. It is a favorable table dish, corn starch being one of its valuable productions and it is often used in making whiskey. Heretofore it may be said to have been used indirectly in the manufacture of soap, being a principal agent in forming the fat on ham and bacon, but never until lately was it known that corn in its natural state possessed some of the most important requisites for soap making. Now that this new use has been discovered, the corn fields need not necessarily be more numerous, in order to satisfy the increased demand for the cereal, but the cultivation of this grain will certainly be none the less profitable in consequence.

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

TO READ THE TONGUE.—The perfectly healthy tongue is clean, moist, lies loosely in the mouth, is round at the edge and has no prominent papillæ. The tongue may be furred from local causes, or from sympathy with the stomach, intestines or liver. The dry tongue occurs most frequently in fever, and indicates a nervous prostration or depression. A white tongue is diagnostic simply of the feverish condition with perhaps a sour stomach. When it is moist and yellowish brown it shows disorded digestion. Dry and brown indicate a low state of the system, possibly typhoid. When the tongue is dry and red and smooth, look out for inflammation, gastric or intestinal. When the papillæ on the end of the tongue are raised and very red we call it a strawberry tongue, and that means scarlet fever. Sharp, pointed red tongue will hint of brain irritation or inflammation, and a yellow coating indicates liver derangement. When so much can be gained from an examination of the tongue, how important is it that the youngest child should be taught to put it out so that it can be visible to the uttermost in the throat! —Dr. Julia Holmes Smith, in *New York Ledger*.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,
New Jersey Commission, 1889,
Ohio Food Commission, 1887,

The Dearest Spot on Earth

is the spot that's washed out *without Pearline*. It costs in clothes, in the rubbing and scrubbing that wears them out quickly; it takes twice the time, and double the labor. It's expensive washing before you get through with it—and the cost comes home to *you*, no matter who does the work.

Pearline saves money by saving work, wear, and time. It hurts nothing; washes and cleans everything. It costs no more than common soap, but it does more. It's cheap to begin with—but it's cheapest in the end.

Beware of imitations of PEARLINE which are being peddled from door to door.
196 JAMES PYLE, New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month**, and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions**, arranged for practical use; timely hints to **Housekeepers**; cheering and helpful talks with **Mothers**; valuable information for lovers of **Flowers**; a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, March 23, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	60c @	55c @
No. 1	55 @ 60	50 @
No. 2	50 @	45 @ 50
No. 3 and Shipping	40 @ 45	40 @ 45
Clover Mixed	45 @ 50	40 @ 45
Clover	45 @	@
Long Rye Straw	80 @ 85	@
No. 2 "		
Oat Straw	35 @	
Wheat Straw	@	

Receipts week ending March 21, as follows:

Via N. Y. Central	150 cars.
" West Shore	109 "
Other roads by Lighter, 34th Street	50 "
Total	309 cars.

The market rules steady and firm, and has since our last issue. A choice car of hay would sell to-day at 70 cents, but it would take but few cars to break the price, there being so much No. 1 Hay used in its place. There is little stock that remains unsold, and shipments started now ought to meet with above quotations. There is every prospect of increased supply soon in all grades. Rye Straw plenty and dull at quotations. Perpetual pressed Hay not plenty, and moves as quickly as large bales.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy, in large bales	$13.00 to $14.50
Hay, choice to fancy, perpetual pressed bales	12.50 to 13.00
Hay, fair to good	11.00 to 12.00
Hay, poor to ordinary	9.00 to 11.00
Hay, Clover and Clover mixed	9.00 to 11.00
Hay, swale	8.00 to 8.50
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	8.00 to

BOSTON, March 21st, 1891.

Receipts for the week are 156 cars of Hay and 16 cars of Straw; corresponding week last year, 250 cars of Hay and 10 cars of Straw. Receipts of hay continue small and market is in better condition than for a long time. There are still quite large stocks of hay here unsold, but they are much smaller than a few weeks ago, and are being slowly reduced. We do not look for high prices, but expect a good market for the next few weeks, and think it a favorable time to make shipments. Rye Straw is steady at quotations. Very little demand for Oat Straw or Swale Hay.

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

DOCTORS AND NEWSPAPERS

The common sense tendency of the present period, among other reforms it is effecting, is gradually doing away with the system of exclusiveness with which the medical profession has striven to shield itself from the observation of the outside world. The latest step in that direction is the acknowledgment by the medical fraternity of the advantages derivable from newspaper co-operation. The Medical Society of this county last week discussed at considerable length the subject of the relations between the newspapers and its members, or, in other words, whether physicians should allow themselves to be interviewed and quoted by the public press. A majority of the doctors present at the meeting held, as too strict, the existing code which declares it unprofessional "to permit their opinions on medical and surgical questions to appear in the newspapers," and there is good reason to believe that the code of medical ethics will, before long be materially modified in this respect. Of course the daily papers have taken up the discussion, and are not likely to relinquish it. The objection urged by some of the doctors, that the public might derive harm through the lack of technical medical knowledge on the part of newspaper writers is fairly met by the *Recorder's* remark that "lawyers are apt to hold a similar opinion about newspapers and legal matters; although, so far as is known, no clergyman has yet thought it worth while to suggest that even a lay journal should have on its staff an eminent divine who should treat exclusively of religious affairs." The three learned professions, our contempory goes on to say, stand in such a relation to the public whose spirtual, corporeal and civil condition it is their business to look after, that the newspaper, whose function is a public one, should always be able to let the public know what those professions are doing for it. No special expert knowledge is here required any more than special information as to architecture is requisite in a man who writes editorially or as a reporter about a house that has tumbled down. When the doctors find themselves in the clutches of a newspaper interviewer they may be well assured that people at large "want to know, you know," and that the men who are sent to sound them are, as a rule, fully competent to do the work. If an editorial is needed about the matter it also will be written by somebody who knows quite as well what his relation to the public is as any physician possibly can. And the *Press* expresses the belief that the opinions on the subject laid down by Dr. George F. Shrady, "will be endorsed by the laity, and may be followed as a guide for the profession without detriment to its dignity." That eminent physician is quoted as saying that the proper course for a physician, to whom a reporter is sent, is to frankly express his professional opinions on subjects that really concern the public. But in doing this he would have the physician lay aside all thought of himself, and speak whole heartedly and to the best of his ability as a representative of his profession. This is not only a safe rule for physicians to follow, but one that would result invariably in the public benefit. It is when a physician sinks self that he elevates and ennobles his profession, and thereby unconsciously raises himself as well.

AMERICAN QUICKSILVER.

The principal uses of quicksilver are in the form of amalgams for recovering the precious metals, in making vermilion, fulminate of mercury for use in cartridges, in thermometers, steam gauges, and all kinds of mechanical instruments. In the form of corrosive sublimate it is not only an excellent disinfectant and antiseptic, but it is employed to a considerable extent in preservation of timber used in underground or underwater construction. But in that industry which is popularly supposed to consume a great deal of quicksilver, viz., the making of looking-glasses, very little is employed. Mirrors are now covered almost entirely with a solution of pure silver precipitated or sprayed on the glass. After this is done the glass would be still transparent were the backs not painted over with a brown or other dark colored paint of a certain chemical composition, first introduced from Bohemia by a firm in New York just before the war. In the old way of making mirrors the glass was covered with an amalgam of quicksilver and tinfoil, and whereas the silver-backed mirrors are ready for handling the next day, the quicksilver and tinfoil require two weeks before the amalgam was sufficiently hard for handling. The quicksilver process makes the best and most endurable work, the painted backs of the silvered glasses being apt to change color in spots. The quicksilver method is, however, the most expensive, which largely explains the reason for its decadence. The production of quicksilver throughout the world during the past ten years is put at 1,093,611 flasks, of which the United States produced 407,675, and Spain, Austria, and Italy 685,936 flasks. During the year 1889, California produced 26,454 flasks, or 2,024,496 pounds. California has 11 mines in operation, with 39 furnaces, employing 937 hands, of whom 520 worked underground. The amount of cinnabar ore mined was 95,714 tons. The capital invested in the 16 establishments is $1,333,114, of which $680,470 is represented by the mines and real estate, $222,300 in furnaces, houses, etc., and $146,150 in machinery tools, etc. The total expenditure for the year was $845,911, of which $626,288 was for wages. The cost of producing the quicksilver per flask averaged $33.31 per flask of 76½ pounds, or 43½ cents per pound.

THE FIRST ELECTRIC MOTOR.

It is a fact not generally known, that Vermont claims the distinction of the invention of the first electric motor. A blacksmith of Brandon, named Thomas Davenport, had a model of an electric motor in successful operation in 1835, by which he ran a small engine on a circular track. He secured a patent on his invention and exhibited his model in several cities. He succeeded, after much difficulty, in forming a company, with headquarters in New York, for the manufacture of engines under his patents, and work was actually begun, but the company soon became embarrassed through the dishonesty of an agent. Davenport died before he could secure new capital to carry out his idea. His model was purchased by the Rensselaer Polytechnic Institute at Troy, where it was kept as a curiosity until the destruction of the Institute buildings by fire in 1862.

ASBESTOS MINE.—The Seattle (Washington) *Press* states that quite recently, near Ledro, a party of prospectors discovered "a mine of asbestos which is inexhaustible in quantity." They had brought with them a sample, and, from what was seen of it and learned from one of the miners who had considerable experience in connection with the material, "it is thought that the quality of this mineral is of a superior order."

GROCERS IN TINSEL.

THE RECENT "FOOD AND HEALTH EXPOSITION" AT THE LENOX LYCEUM.

In the AMERICAN ANALYST for February 19, 1891, we made an announcement of the intention of certain gentlemen, who, for a consideration, manage the retail grocers of New York, to give an exposition at the Lenox Lyceum, in Madison Avenue, New York, of the pure food sold by their constituents. Our notice, we are informed, did not please one of those gentlemen, which is a subject of regret. After all the wholesale grocers, jobbers, manufacturers, and food purveyors of the United States had been duly cajoled, argued with, importuned and threatened to buy space in the Exposition Hall, and more space in the official souvenir catalogue, and a sufficient number had been talked into it, the Exposition was opened March 9. Our readers naturally expected us to tell them just what the much-trumpeted Exposition consisted of; we therefore went to the hall, and paying our twenty-five cents at the ticket window, for the benefit of the management, we were favored with an admission ticket and commenced our observations. First we noticed that, while there was no crowd at the ticket window, quite a throng presented tickets at the door, and if it had been a first night at a theatre we might have suspected "papering," an old dodge to fill a house, but as this was a "*pure*" food exhibition, we were compelled to frown down the impious thought. Arrived inside we found a great, surging, elbowing crowd chiefly engaged in a struggle to obtain free samples of various things, some that could be carried home and some that had to be eaten or drunk on the premises. The most successful foragers soon were loaded down with samples inside and outside, and many looked as if they would soon be able to start a boarding-house, provided they survived the inordinate strain to which their stomachs had been subjected. Just think of a person commencing a free lunch on three-minute oatmeal with cream, and then going through the entire menu of buckwheat cakes, maple syrup, cider, cocoa, chocolate, lager beer, mineral water, jam, jelly, preserves, ice cream, candy, soup, crackers, peptonized beef, artificial ice, plum pudding, salad dressing, bogus Worcestershire sauce, German wine, California wine, salicylated fruit juice, condensed milk, catsup, pickles, mustard, bogus coffee, caviar, Ceylon tea, yeast, green peas, mince meat, fluid beef, cocoanut with and without paraffine, salad oil, devilled crabs, bovinine, ginger ale, and—but our memory fails us, and we fear to trespass further on the credulity of our readers or our space. We will start out by saying that the sight presented to the eyes of the visitor was a beautiful one. The variety of colors tastefully blending in the bright electric and gas light, the tasteful arrangement of the various booths, and the displayed goods, all made a pleasing impression upon the eye. Bad management, however, permitted over-zealous salesmen to distribute free samples not only in the booths, which would have been but right and proper, but in the middle of the various aisles, thus creating an impassable and very dangerous over-crowding; the same thing was permitted in the narrow passage-ways behind the boxes, and also the encroachment of soda water stands on crowded stair landings made a promenade through the Exhibition Hall anything but a pleasure trip. The most striking displays made by those whose goods, known to be pure, will permit us to mention were those of the Cleveland Baking Powder Company, who had their space draped in orange and black to correspond with the color of their labels. The F. Schumacher Milling Company had an old mill with men, dressed as millers, handing out samples of oat preparations. Walter Baker & Co., in a modest side room upstairs, served all comers with chocolate and cocoa in a very handsome arbor and by young ladies dressed as their well-known trade-mark, the chocolate girl and men in the costume of pages. Richardson & Robbins had a tasty display of their celebrated canned goods. C. Maspero had an attractive exhibit of olive oil, and the Crystalline Salt Co. showed some fine, dry and white table salt. The Highland brand of milk people showed their condensed milk, misnamed evaporated cream; this would have offered a good chance for the Retail Grocers' Pure Food chemist to have shown his skill in detecting any characteristic of cream in this sterilized condensed milk. The New York Condensed Milk Co. confined their exhibit to the Eagle brand, which is their best brand, and the only New York product containing full sixteen ounces to the can, and their fresh milk and cream in bottles. There were two or three brands of desiccated cocoanut exhibited, all claiming to be pure. They can well afford to sell sugared cocoanut at the dear prices they get, but whether the paraffine added by one of these concerns to preserve their goods from rancidity adds anything desirable to the flavor we doubt. Not long ago it was clearly demonstrated that one brand of this desiccated cocoanut, to meet competition, was largely weighted with terra alba. Of course this particular brand was not shown at this Exposition. The Columbia Chemical Works distributed samples of their Zomonia, a combination of ammonia and soap powder and their oleated ammonia. Parke, Davis & Co., of Detroit, had on exhibition their Mosquera's Beefmeal, claimed to be a predigested powdered beef for invalids. Armour & Co., of Chicago, made a splendid and very attractive exhibition of their Fluid Beef Extract. Bovinine, made by the J. P. Bush Manufacturing Co, attracted considerable attention. The Christian Moerlein Brewing Co., of Cincinnati, made their debut in the East at this show with their queen of beers, "National Export." Carl H. Schultz had a large array of his syphons and fountains of artificial mineral waters. G. B. Seely's Son exhibited the various carbonated beverages made by him. The Phœnix Bottling Co. displayed all of H. Clauson & Son's brewings which they bottle. W. G. Dean & Son's Ardenter Mustard and Licorice manufactures attracted marked attention, but were brought in somewhat unfair competition with mustards made by other makers which would not bear scrutiny. Chas. Gulden showed a neat pyramid of his German and French mustards. Of cereals, good, bad and indifferent, there seemed to be no end. The Foulds Milling Co., of Cincinnati, claim for their wheat germ meal that it is composed principally of the germ and gluten separated from the starchy portion of the berry. George V. Hecker & Co. exhibited their innumerable preparations of flour and oatmeal. The Cereals Manufacturing Co. made a good showing of their A B. C. brands, but by indiscriminately attacking all their competitors in the circulars they distributed they hurt themselves. Rex Wheat was another aspirant for popular favor. Francis H. Leggett & Co. displayed, in addition to a variety of cereals, olives, extracts, jelly, spices and Hume's salmon. E. C. Hazard exhibited their new cereal Branum, tomato catsup and chutney, and Mayonnaise dressing. Pillsbury, of the Minneapolis Mills, had a fine large pyramid of his celebrated flours on exhibition. Potter & Wrightington, of Boston, did not exhibit their manifold fish products, but invited every one to Ta-Ka-Kake. M. D. Stevens' Imperoyal prepared flour and vacuum cooked cereals were brought into prominent notice. The Quaker Mills Co., of Ravenna, O., made a fine display of their oatmeal. Finally, we noticed the much-advertised H-O, but, as that manufacturer has not yet got over his fallacy of offering parched oats with a guaranty that they will cook in three minutes, he is a dangerous food purveyor and best let alone. Electric Lustre starch was there in all its Boston glory. We also could not suppress a smile at one well-known Cheap John spice concern, whose goods are best described as homœopathic, who distributed cards with the adjective "pure" applied to every article. The samples on exhibition may have been pure, but what do they represent? Among other exhibitors, was an imitation Worcestershire sauce, claimed to be imported in glass from England, and manufactured by a vinegar firm in "Brummagem." It had a decided Brummagem appearance and vinegary smell. The principal advantage claimed for it is cheapness; if the claim had been for cheapness and nastiness, it would be allowed. John Duncan's Sons, the American agents for Lea & Perrin's original and genuine Worcestershire Sauce, having for some reasons best known to themselves, like many other first-class houses, abstained from participating in this Exhibition, there was no standard of comparison. No one who knows the genuine Worcestershire Sauce will ever buy this cheap imitation, although the close imitation of the Lea & Perrins' labels on this stuff shows that the aim of the manufacturers is to get a part of the old-established trade of the older house. Like every other such imitation, it will prove a failure. Among the chocolates and cocoas exhibited, was Maillard's, Huyler, Chocolate Menier, Rockwood and Runkle, the latter having been allowed by a peculiar management to completely block up the entrance to Walter Baker & Co.'s much larger and handsomer exhibit. Both the competing cracker bakeries had fine exhibits. Pyle's Pearline shone resplendently above every other soap house; Curtice Brothers' canned goods; Washburn, Crosby & Co.'s flour; Goode's Ball Blue; E. T. Cowdrey & Co.'s canned foods; Franco-American Food Company's soups; Platt's chlorides; Durkee's condiments; Hygeia water; Malted Milk Co.; Wrigley's scouring soap; scourene; Arkell's hams; Ross's ginger ale; Reynold's cheese; Gladding's popcorn; Bolen & Byrne mineral waters; Max Am's preserves; Dobbin's Electric soap; Lalance Grosjean Manufacturing Co. agateware utensils; Major's glue; Higgins' soap; Fleischman's yeast; several more or less pure or impure California wines, with and without French and German labels, made up the balance of the jumbled up advertising show. This is really what it was, gotten up primarily as a money-making scheme, with no possible chance of accomplishing any good for the advancement of pure foods—a huge, over-crowded, illy-arranged fair, ostensibly for the purpose of showing only pure goods, in reality to exhibit anything and everything that would pay for space and advertising. It will be a good thing when closed, and it is to be hoped never to be repeated again. One feature particularly noticeable was the conspicuous absence of any representation of some of the best-known food producers who generally exhibit at all first-class expositions, such as F. H. Ferris & Co., ham and bacon; Gordon & Dilworth, John Duncan's Sons, J. P. Smith, Thurber, Wyland Co., Bass' ales and Grattan's ginger ale, St. Louis Stamping Co.'s agateware, nearly all the large soap manufacturers, the principal starch manufacturers, Atmore's mince meat, and too many to put down here, who invariably exhibit at every first-class exposition. Why this was so we can only surmise, and must leave the reader to guess. Additional attraction was supposed to have been given to this show by the high-sounding announcement that a prominent chemist would be in constant attendance, who would on request analyze, in the presence of the visitor, any suspected food product on exhibition. Every one knows that no reputable chemist would do this, and that no real chemist could do this, yet we cannot help the thought that if such a thing were possible what a Herculean job he would have had, for the well-known and oft-exposed food frauds had tons of adulterated stuff on exhibition. Some of the exhibitors were shrewd enough not to exhibit any of the goods they usually sell, but had procured "for this occasion only" the best that could be found in the market, regardless of price, and were brazenly distributing samples of such goods as specimens of what they wished the public to believe they always sold. Hosts of what the managers well knew to be base imitations were here on exhibition. In some instances first-class houses, well known to have only pure goods, were found in out-of-the-way corners, while those having the vilest trash to sell were in the most conspicuous places. It seemed as if the question was not to get up the best exhibition of pure food, but the largest exhibition of anything the owners of which would pay best for prominent places on the floor and in the advertising pages of the programme. If this was the sole intent, the Exhibition must have been a huge success, and the managers can well rub their hands in glee.

VASELINE.

A GERMAN CHEMIST DESCRIBES ITS MANUFACTURE.

The lack of communications concerning vaseline and its manufacture leads us to imagine that a few remarks on this subject may be of interest to chemists and others. In a previous number of the *Chem. Tech. Cent Anzeiger* (1881, 42) two methods of manufacturing vaseline are given, one of which is specially prepared for official inspection, the other being entirely devoted to the excellent article made by L. Meyer, of St. Johann. No special points in the manufacture are brought out, and there is no space devoted to the theory of the manufacture, which is specially necessary for the explanation of this industry. It should also be noticed that several expressions in the descriptions above referred to appear more suited for a technical society than for a scientific journal. That "sulphuric acid produces particles of carbon in oil" is, to say the least, not an expression which can be recommended as a model of scientific accuracy. It is also difficult to understand why the last traces of the chemicals employed cannot be removed from the oils. We, in the mineral oil industry, remove the very last traces of reagents, and so do those vaseline manufacturers who use chemicals, and do not confine their purification to filtration through a charcoal filter. It is now generally known that every vaseline manufacturer has his own secret process, and preserves it as closely as he can; any one not belonging to a works being thus compelled to make his own investigations. Leaving unregarded the two methods previously mentioned, the following process has been devised, similar to that usually employed in the manufacture and purification of brown coal tar. In commencing such an investigation, it is necessary to first of all definitely settle two points: "What is the quality of the new material?" and "What impurities are to be removed, and how can this best be done?" Knowing this, the outline of the process to be adopted is more than indicated. The nature of the raw material varies greatly. It usually consists chiefly of the residues of the so-called American petroleum, or it may be Russian oil, especially from Baku, under Galician oil, and even bitumen itself, or natural asphalt, either in the solid state under this name, or of the consistency of tar, under the name of mine tar. It is, of course, obvious that no fixed method of preparation of the article termed vaseline can be given; and, in fact, the processes employed are very numerous. The paraffins, as is well known, are hydrocarbons of the marsh gas series, and are classified into normal and iso paraffins, the corresponding members of which have the same percentage composition, but different structure. The American raw material—the viscid residue left on the distillation of the petroleum—is indispensable for the manufacture of yellow vaseline. The American petroleum, as obtained by boring, contains both classes of paraffins, of which the normal can only be brought to crystallization by the distillation of the petroleum, whereas the iso paraffin remains dissolved in the oil. According to the extent to which the oils are distilled off, a more or less liquid or pasty product is obtained—lubricating oil and vaseline. The distillation therefore effects the separation of crystallizing from amorphous paraffin, and only such raw materials as contain the latter, which therefore cannot pass or can only partially pass into the crystalline state, are fit for vaseline making. Saxon brown coal tar, as is well known, deposits soft paraffin in scales in the cold, and contains no amorphous paraffin. These oils cannot, therefore, be used for the manufacture of lubricating oil and vaseline. The case is quite different with American petroleum. The residues from the distillation of American petroleum, which, as already mentioned, form a viscid or even soapy mass, are heated by steam and then well agitated with sulphuric acid to remove the resin which is still present. At the close of this operation, after running off the resin by a tap, the excess of acid is neutralized with caustic soda or sodium carbonate solution, and the oil thoroughly washed with hot water until all the soda is removed The material is then decolorized by animal charcoal, the liquid vaseline being stirred up with the charcoal by the aid of steam, and is then filtered hot. The only difficulty which has to be overcome in purifying the distillation residue lies in the correct proportion of soda solution to acid, which must be closely adhered to, since an excess of the former may emulsify the whole mass. The animal charcoal which is employed to decolorize the hot vaseline contains, as is well known, many inorganic salts especially calcium phosphate and magnesium phosphate, as well as potassium chloride, sodium chloride, etc., so that it must be washed out with hot water, then with hydrochloric acid, then again with hot water, and finally dried; it thus acquires the property of retaining any caustic soda which has not been removed by washing. The Russian oils are of special interest because of the "vaseline oil" which is made from them. After the light oils and normal paraffin have been removed from the oils, the heavy oils are purified by pressing, whirling and decolorization, and then form the "paraffinum liquidum" of the pharmacopœia, which is also, probably, a solution of the iso paraffin in mineral oil. Messrs. Hill, of Troppau, in Austrian Schlesien, have for some time been producing a so-called "viscous natural vaseline." This product is of a darker color than the American quality, and is manufactured from so-called "blue oil," obtained in the distillation of Gallician petroleum, directly after the light oil. It is an almost buttery mass, which deposits scales of paraffin in the cold, and is, therefore, also a mixture of heavy oils and solid paraffins. If, however, the distillation be stopped immediately after the lightest oils have come off, the residue in the retort, after treatment with sulphuric acid, etc., forms a homogeneous, fatty, lustrous mass—vaseline. This "viscous natural vaseline" is, therefore, the residue of the so-called "blue oil," which still contains amorphous paraffin, to which it owes its viscosity. In making some experiments on the manufacture of vaseline, an oil was selected which had been obtained from the natural asphalt of Bentheim. The latter was submitted to distillation over a fire, and the oil fractionated according to its specific gravity. The oil of specific gravity 0 856 appeared the most suitable for the purpose. It was mixed with 4 per cent. of sulphuric acid of 66 deg. B., and the resin drawn off after allowing the oil to stand for about twelve hours. It was then washed repeatedly with hot water until the latter gave no reaction with litmus paper. The clear oil was next thoroughly shaken with caustic soda solution to remove creosote, the lather drawn off, and the oil again washed and treated while hot with the so-called decolorizing powder, the residues of the potassium ferrocyanide manufacture. The mass was then filtered and distilled until a heavy oil remained in the retort, which, after pouring out, became more viscid on standing, and was a kind of vaseline, since it deposited no crystalline matter even at 10 deg. Unfortunately, the light yellow mass became dark-colored again when the oil was redistilled over the flame. However, no apparatus was at hand which would permit of the treatment of the strongly concentrated oils with reagents by the aid of steam, and it was, therefore, necessary to distill the oil after treatment. The vaseline obtained was yellowish brown, and had the well known bluish fluorescence, but was still rather fluid, differing in this respect from the American article, which it otherwise resembled. The object was to prove that any distillation residue containing iso paraffin is more or less fitted for vaseline making, and this was successful. Whatever special method the individual manufacturers may possess of bringing the oils to the right consistency more rapidly and more simply, or of producing a light-colored and odorless vaseline, the main outline of the process adopted cannot vary much, and must lead to the wished-for end, provided that the crude material contains amorphous paraffin. Only such a material, which remains without crystalline deposit, even in the greatest cold, can produce the requisite viscosity of vaseline, and it will be found impossible to produce viscous vaseline from an oil which contains normal paraffin. The product will simply be a solution of crystalline paraffin in oils, without possessing the proper viscosity of vaseline, and will crystallize at a low temperature.—*Chem. Tech. Anzeiger.*

NEW SPIKE.—Recently experiments have been made in the manufacture of spikes, with a view to making a finished article by rolling the bar in such a manner that its width shall be the length of the spike, and in such shapes that the spikes may be cut from it with shears, similarly as a cut nail is made, except that the head is made in the rolling process. In tests made by running through some steel nails that had been slowly heated for 2½ hours the result showed that the mechanism might be adapted to the object aimed at.

MANUFACTURED RELICS.—Many Western towns are filled, just at present, with itinerant vendors of souvenirs of the fight at Wounded Knee, and for a moderate investment of cash the Eastern tenderfoot can procure any sort of a relic—from "the leggins the Medicine Man wore when he threw up a handful of dirt and ordered the red devils to fire," to a ghost-dance shirt. A genuine article of this sort, brought by a Chicago newspaper man from the battle-field, where it was stripped from the back of a dead squaw, is made of white cotton-cloth, embroidered with yellow. It is covered with blood from the wound that caused the former owner's death, and is a most ghastly trophy.

OVERCROWDED PROFESSIONS.—France is suffering almost as much as Germany from the overcrowding of the learned professions. Fifteen thousand schoolmistresses, 7,000 primary schoolmasters, and 500 high-school instructors are looking in vain for employment. There are 27,000 French physicians—that is, about 6,000 or 7,000 more than there are in Germany, with her 10 000,000 more inhabitants. Paris has 800 apothecaries. Two thousand lawyers in Paris, who have passed all preliminary examinations for a full practice, cannot make livings in their professions. Civil and mining engineers are so numerous that hundreds of them are seeking eagerly petty positions in mines and factories.

COUNTERFEIT GEMS.—No other gem has been counterfeited with such perfection as the emerald, and in fact it is utterly impossible to distinguish the artificial from the real gems by the aid of the eye alone, as even the little flaws which lull the suspicions of the experienced, easily produced by a dexterous blow from the mallet of the skilled artisan. Not only emeralds, but most of the gems and precious stones are now imitated with such consummate skill as to deceive the eye, and none but experts are aware of the extent to which these fictitious gems are worn in fashionable society, for oftentimes the wearers themselves imagine they possess the real stones. There is not one in a hundred jewellers who is acquainted with the physical properties of the gems, and very few can distinguish in the rough the diamond from the white topaz and the zircone, the emerald from the tourmaline of similar hue, the sapphire from the iolite, or the topaz from the Bohemian yellow quartz. Jewellers are governed generally by sight, which they believe to be infallible, while hardness and specific gravity are the only sure tests.

ANTE-COENAL MOODS.—"Do you know," said a matron, whose married life extends over a score of years, "that I attribute, in a considerable degree the happiness of our life to a custom which my husband and myself have unfailingly respected—we never do any talking, hardly speak to one another, indeed, before breakfast. He was quite a confirmed bachelor when I married him, and he told me soon afterward that, until he had taken his breakfast coffee, he held the most morose and gloomy views of every thing. I thought at first this was a little peculiar, but when my attention was thus called to it, I discovered that I, too, found life much more agreeable and small burdens more bearable after I had broken my night's fast. Many wives tell me their most available time to talk over things is during the dressing hour. I always feel like begging them to try some other time. It is a mental exertion to discuss the ways and means of this exacting existence of ours—too great a one, I think, to be indulged in before breakfast."

AMMONIA.

WHAT ITS PRESENCE IN WATER AND FOOD ARTICLES MEANS.

Since the publication of Wauklyn & Chapman's methods of water analysis, the ammonia test of the purity of water has been universally adopted by chemists. The danger in drinking water is just in proportion to the amount of ammonia it contains. This has long been known, but so small an amount was necessary to make a water unhealthful that until the discovery of recent chemical processes, it was almost impossible to apply any test that would measure it. Now, by what is known as the Fessier test, one part of ammonia in 200,000,000 parts of water is instantly detected. But what is ammonia? Ammonia is a colorless gas of a pungent smell, and strong alkaline taste. It is obtained from its salts, sal ammoniac, by the action of a strong solution of potash or soda. Ammonia salts are the products of putrefaction. It was first manufactured in Egypt, whence all of Europe's supply for many years came. The most prolific source of ammonia is from the decomposition of animal excreta and urine, and in Egypt it was made from camels' dung, and, as large amounts of this were collected about the temple of Jupiter Ammon, the drug was thus named ammonia. During the months of March and April the decomposing dung contains the most ammonia, and during these months the poor people collect and dry and burn it. The soot which comes from its smoke is collected and sold, and from it is manufactured ammonia. That was the process of manufacture in times gone by. A good deal was also made in early times from putrid urine and other forms of decomposition. Since the introduction of gas lighting, however, ammonia has been made almost entirely from crude gas liquor, although it is still manufactured by the fermentation and distillation of decaying animal matter. Owing to its pungent odor and taste, which renders its detection very easy in immediately deadly quantities, deaths from ammonia are less frequent than from many other less powerful poisons. In point of frequency, as causing death by murder, suicide or accident, ammonia is classed in England as thirteenth in the list of poisons. Alexander Wynter Blyth, of the Royal College of Surgeons, and medical health officer of London, mentions thirty cases of poisoning by ammonia direct, or by some food article into which ammonia entered as an adulterant. In two of those cases doses were given to children for the purpose of murder. In eight cases it was taken for the purpose of committing suicide. The remaining twenty cases were accidental; that is to say, the ammonia was unknowingly taken in some good preparation. Six out of the eight suicidal and twelve out of the twenty accidental cases resulted fatally. Ammonia is set free in considerable quantities from decomposing guano. Men who work in guano factories suffer slow poisoning from it. It causes total deafness in some cases, and in nearly all cases of men so employed there is noticed a peculiar discolorization of the skin of the nose and forehead. Ammonia absorbed in even infinitessimal quantities, during a continuous period, imparts to the complexion a peculiarly dead, pasty appearance. The skin is usually the first to show in this way traces of the drug. Other symptoms are a general lowering of bodily strength, dull, lack-lustre eyes, and evident anæmia. Its effect upon the more sensitive organization of women is more quickly noticed than upon men. It produces more quickly with women the sallowness of complexion which is one of its earliest symptoms. This discoloration is a marked feature of ammoniacal poisoning. Post-mortem examinations of those who have died of the poison show that the coats of the stomach and of the intestines are stained a dark hue. The time of death from ammoniacal poisoning varies from four minutes to several months, according to the size and frequency of the dose. In the mechanical world ammonia is of great use. Its strong alkaline effects make it very valuable for the coarser sort of scouring and cleansing. A great source of danger to the public health is its frequent use as an adulterant in food preparations. The manufacturers of baking powder resort to it the most frequently and the most recklessly. By its use a great saving is made in cream of tartar, which is very expensive, and at the same time the ammonia gas, which is liberated by the action of the soda in the powder, gives great leavening strength, but a heavy residuum of sal ammoniac is always left in the bread, and this strong irritant is highly injurious to the coating of the stomach. It produces acute dyspepsia, and in time the blotched, sallow complexion, and other symptoms of ammoniacal poisoning appear. There is even more danger to public health from such sources than there is in the contamination which the chemists agree that the presence of ammonia in hydrant water implies. A mere trace of ammonia in water is sufficient to cause chemists to condemn it. In the adulteration of foods it is used with a recklessness that is little short of criminal.—*Boston Herald.*

ARTIFICIAL FLOWERS.

HOW THEY ARE MANUFACTURED IN NEW YORK

The process of flower making begins, according to a writer in *The Sun*, with the man who stamps out leaves and petals. He has perhaps one hundred short, stout iron spikes, each bearing on one end an iron stamp, fashioned so as to cut out of cloth bits shaped like the petals of one flower or another. The cloth, velvet, sateen, satin, or what not, is laid upon a leaden slab and the stamp is struck smartly with a hammer. In this way thousands of petals are struck out rapidly, the cloth being folded many times before the process begins. From the stamper the work passes to the dyer. The latter is usually a Frenchman or a German learned in the art of mixing colors. Rose petals come to him white, and he dabs each with a bit of carmine, leaving the points untouched. From him the petals, ranged in rows on a board, pass to a boy or girl, who applies a bit of yellow dye to the white point. Then the petals are put over a furnace to dry. From this point onward the work is done exclusively by girls. Their tools are exceedingly simple. The gopher is a little iron implement for curling petals. Tweezers, scissors, and mucilage brush about complete the outfit. The flat rose petals are set before half a dozen girls, seated around a table, upon which glows a small gas furnace. Each girl is armed with a gopher, and the gopher, after being heated a moment in the flame of the furnace, is applied with a quick wrist motion to the petal as it lies upon a little cushion. Under the heat and pressure the petal is instantly curled into a hollow, cup-like imitation of the natural object. The freshly gophered petals are presently put together along with the stamens or "pips, as they are called in the trade. These are usually made by machinery at another factory. Sometimes the stem and branch of the rose are imported, and merely tacked on in the factory; but this part of the business is also carried on here, and there are some branchers in New York. Although the work is thus minutely subdivided, the best flower makers learn the business in its entirety, save stamping and dyeing. Those branches seem to be left almost exclusively to men. The test of a girl's skill lies in her ability to make a rose. The best rose-makers follow nature with marvelous fidelity. The manufacturers show you branches of clustered roses with everything complete, even to great natural-looking thorns and defective, worm-eaten blossoms. Dozens of flowers are imitated in the factories of this town, but the more familiar blossoms are most in demand. It is a secret of the trade that blue corn flowers are to be popular this spring, and there are many hundreds of boxes of them blooming beautifully in the factories at this moment. The show-rooms at the factories are a perfect delirium of color now, and the stock will go on accumulating, until the retailers begin to get hold of it six or eight weeks hence. January is the height of the busy season with the flower makers, and the work goes on briskly through February and March. It is duller in April and by the first of May there is nothing more to do. Then, however, preparations are made for feather curling, and during the hot weeks of July thousands of deft fingers are busy making the feathered ornaments that are to adorn fashionable hats in the following winter. If flower making went on the year round, the flower makers would be well enough off. A clever girl acquires in two years sufficient skill to command from $8 to $12 a week, and the best workers earn even as much as $18 a week. Forewomen get from $20 to $30 a week, though the latter is a high figure. Most of the girls are very young. Many begin to learn the business at 12 to 14 years of age, when they can earn only $1 a week, and when some even must pay for the privilege of learning.

THE PROBLEM OF THE PERIOD.

HOW SHALL THE ARMY OF THE UNEMPLOYED FIND SUBSISTENCE?

The social problem of to-day has many perplexing phases, but there is one that almost fills us with consternation. What can we say when men want work, and yet there is no work for them to do? If a man is not able to work, the instincts of humanity lead us to help him; if he *will* not, he should either be made to, or else allowed to starve. But if we open our eyes and look beyond the surface of things, we are led to suspect that there are not few persons who belong to neither of these categories. Careful observation shows that there are in Great Britain several millions of the unemployed who would gladly work if they could get work, and a million such on this side of the ocean, taking the country altogether. But how can it be? we ask. Is not every pair of hands able to add a certain amount to the wealth of the world—to produce at least enough to get in exchange what is necessary to keep one alive? It would seem rational to suppose so. How is it, then, that an able-bodied person of good habits can go about seeking for work and not finding it? The immediate answer is, of course, that no one wants to employ him. But why the refusal to employ? The answer often comes from the employer or business house, "We have already more labor than we can profitably use." Notice for a moment what is implied in such an answer, "Profitably use!" It means that, if a man is hired, it is assumed that his labor is sufficient not only to support himself but to help in the support (*i. e.* to add something to the purse) of the one who hires him. The labor that is employed in the ordinary channels of industry has a surplus value; it creates more than is necessary to sustain itself — and the "more" helps to make the profits of those who employ it; it is to get this "more" that employers (so far as they act from business motives) hire labor; and when it ceases to have this surplus value, they do not hire it. If this is so, the question of the unemployed presents a new face. If a man is honest and industrious, and able to earn his bread, he can find employment only in case his labor will produce a profit for some one else. If his labor is sufficient simply to put clothes on his back and food in his stomach, and provide shelter for himself against wind and weather (and by himself I mean his family too), he may not find employment. The only alternatives are in case he can employ himself, or can go back to the original reservoir of all force, and earn his living directly from the land. Self-employment, however, in competition with the large organized industries of the present time, is almost impossible. Nor is getting one's living from the land so easy a matter. First, there is the difficulty for the poor man of getting to the land. Second, the land of the country is fast passing into private hands, so that, save in rare instances, one must

pay rent for the privilege of getting one's living from it. This means that the worker shall be able to produce a surplus over and above what is necessary for the subsistence of his family, this surplus going into the owner's pocket. The case standing thus, it seems to me perfectly possible that there should be a considerable body in the community ready and able to support themselves, who have either to secure charity or steal or starve. Mr. Mills, in recounting his experience among the destitute poor of Liverpool, tells that one cold December morning he found in a certain house a baker out of work, and next door to him a tailor out of work, and next door again a shoemaker in the same plight. The trouble with these people was, of course, so far as each of them was concerned, that their services could not be employed at a profit by any one—the markets, perhaps being already stocked with bread and clothes and shoes, and there being no money in making any more. But why could not these people provide directly for each other's needs, irrespective of whether there was a profit for any one in so doing? Why should not unemployed bakers and tailors, and shoemakers and masons, and carpenters and tillers of the soil be taken out of the profit-making system into which they do not fit, and making themselves into a colony, the bakers bake bread for all, the tailors make clothes for all, the carpenters make houses for all, the tillers of the soil raise corn and wheat for all—each class producing, not to sell to the outside world, but for each other's use, and each class receiving in turn of the benefits of all the others' labor? Once give up the idea that the present system is anything like a part of the order of nature, or otherwise necessary and unchangeable (save that selfishness is necessary and unchanged), and the thought becomes easy of breaking away from the system, and founding an industrial order on other principles. Such co-operative colonies are the only hope that I can see for the unemployed. Sooner or later we shall understand that there are more people than can be made use of in a profit-making system. and that if the surplus population is to have any honor or manliness left in it, it has got to be removed from such a system. Everything would ultimately depend upon wise direction and management. The State, I think, should have as little to do with these colonies as possible. I should look with more hope to some voluntary organization like the Salvation Army than to the State as at present organized. "In Darkest England" seems to me one of the humanest and one of the wisest and most practical books that have been produced in this century. Among the book's recommendations not the least wise is the co-operative factory and colony idea.—*New England Magazine.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish, trout, sturgeon.

VEGETABLES. — Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

RICE SOUP.—Put a shin of beef to cook for five or six hours, then remove the bone; see that your pot contains four quarts of water, and add the following ingredients: a chopped onion, a grated carrot and turnip, two table-spoonfuls of chopped parsley, half a pound of rice, and salt and pepper. Let these cook in the soup for about an hour, then serve.

BECHAMEL SAUCE.—Put into a saucepan half an ounce of butter, half a medium sized onion, minced, half a pound of minced raw veal, one small carrot, shredded; toss about for two minutes, to fry but not to color; add two table-spoonfuls of flour, stir it about with the vegetables, then add three pints of hot water, or, if convenient, use hot soup stock instead; add a pint of boiling cream. Season with half a teaspoonful of salt and a salt-spoonful of white pepper. Simmer one hour and strain into a saucepan. Add to each pint of sauce half a wineglassful of cream; simmer for a few minutes; strain it again into a crock and whisk it until cold, to prevent a thick top from forming. When wanted for patties, or anything else, boil one pint of it with an ounce of butter, whisking it thoroughly.

CRAB PATTIES.—Prepare some crab shells; take a quart of solid crab meat, either picked from the shells or purchased already prepared; add to it a pint of bechamel sauce; strew in a few shredded mushrooms; fill the crab shells with this and serve.

SAVORY CHEESE CAKES.—Take a cup of finely grated cheese, season it with a dash of cayenne and a little salt; add half a cupful of very fine bread crumbs and the beaten yolk of an egg; form into small cakes and fry on both sides in butter; serve at once. Very nice for lunch.

APPLE PUDDING.—Line a pudding dish with puff paste; lay in a layer of thinly sliced apples, then a sprinkling of cinnamon and sugar, another layer of apples and some sugar and a very little ground clover; some more apples then sugar and nutmeg; cover with a crust with a hole in the middle; mix half a cupful of white wine vinegar with four large table-spoonfuls of sugar and pour them into the hole. Bake half an hour.

ENGLISH WEDDING CAKE.— Two pounds butter, two pounds flour, one pound powdered sugar, sixteen eggs, eight pounds currants, one pound blanched sweet almonds, one pound candied citron, one pound candied orange and lemon peel, one grated nutmeg, one teaspoonful mace. First beat the butter to a fine cream with your hand, then stir in the sugar for a quarter of an hour. Beat the whites of the eggs to a strong froth, and mix them with the sugar and butter. Beat the yolks for half an hour, and mix them well with the rest, then by degrees put in the flour, mace, and nutmeg, and continue beating the whole till the oven is ready. Put in the currants (which have been washed, and picked, and dried by the fire until they are plump), citron, orange, lemon peel, and almonds; lightly chop up the almonds; bake in a moderate oven. Icing.—white of five eggs, half pound powdered loaf sugar, two table-sponfuls starch. Put in on the cake when it is warm.

TRIPE AND OYSTERS —Wash one pound tripe, cover it with fresh cold water, add half a cupful of vinegar and a little salt, and let it stand one hour; drain, cut into dice, and cook for three quarters of an hour in water slightly salted. Take out the tripe; take four cupfuls of the water and put to it half a table-spoonful of butter, a little lemon-juice, some pepper, and a good table-spoonful of flour mixed smooth in half a cupful of cream or milk. When the gravy is thick and smooth add the tripe and one pint of raw oysters; add a dash of nutmeg; let it cook for twelve minutes, then serve.

FOG AND GAS —It has been found, from an investigation made at Dundee, that when a dense fog exists, the proportion of carbonic acid gas in the air is eight volumes per 10,000—the normal proportion being four. In London the proportion is twelve volumes, or even more, under similar circumstances.

POMADES.

FASHIONABLE FRAGRANCE FROM FRESH FAT AND FLOWERS.

During the recent development of horticulture in Florida and California many experiments have been made in the production of perfumes from flowers, and many of these have resulted successfully. There is little wonder, therefore, that inquiries are often made as to the possibility of growing flowers at a profit for manufacturing purposes in the genial climate of these and other States. Many of these inquiries are evidently from persons who have not even a vague idea of the result to be arrived at, not to speak of the details to be pursued, so that perhaps a few hints from one familiar with the products may be useful. Despite all the triumphs of modern chemical science, which has produced synthetically many odors which are more or less useful, it still remains the fact that all high class floral extracts. by whatever name known, are composed, to a greater or less extent, of one or more of the following odors: violet, rose, jasmine, acacia, orange, tuberose and jonquil. With one or more of these in combination with some resins, oils, and animal secretions, the skilful perfumer is able to imitate the odor of any other flower, and produce pleasing bouquets. These odors are bought by the perfumer in the form of pomades, experience having taught that this is the only feasible means of securing them properly. Practically, then, our citizens have this problem before them very clearly, namely, to produce a highly charged pomade at a price which will enable them to compete with the flower farmers of Southern France, who at present supply the world's markets. This pomade is marketed in eleven and twenty-two pound tins, varying in price according to quality. It pays fifty per cent. duty, and the present wholesale price is about $2.50 per pound for violet, and $1.50 to $1.65 for the others. Like all manufactures, the making of pomade cannot be taught by books, but a few hints may help the experimenter. The process of extracting odors is known as *enfleurage*, and is carried on either with or without heat. Jasmine and tuberose flowers are exposed to lard spread thinly on sheets of glass in suitable frames; this soon absorbs the odor, and by renewing the flowers the grease becomes saturated. The perfume of the other flowers is extracted by hot *enfleurage*. In this case an addition of beef fat is made to the lard (insuring a higher melting point); this mixture is heated to the melting point, when the flowers are thrown in and rapidly stirred through the grease; the semi-liquid mass is put under a strong press with suitable filtering material until the flowers are separated. The process is continued till the grease is practically saturated with odor. These processes are simple, and with a supply of flowers there is no reason why a good pomade cannot be produced in this country. Judging from some inquiries, however, it does not seem to be generally understood that the process depends primarily on securing perfectly pure and odorless lard, which is by no means the same as the lard of commerce. No amount of perfume will make impure grease fragrant, and the perfumer will not buy an article of the kind at any price. In his laboratory the perfumer is one of the most practical of men, and buys his materials on their merits. It is just as important to have his pomades free from false odors as that his spirits should have no trace of fusel oil. The process of securing lard free from albumen, membrane and blood, is as follows: Cut up the fat in small portions, separating the membranes as far as possible by hand, and wash till the water runs clear. Melt with a gentle heat in an iron or copper vessel over a water bath, and continue till it becomes anhydrous, or free from water—which may be known by its becoming perfectly clear. Finish by filtering through a clean cloth. This lard will retain an odor which may be removed by remelting and adding a small portion of alum or common salt, and keeping it over the fire till a scum rises, which should be skimmed

off. The salt must then be washed out and the lard again rendered anhydrous. Such lard is kept in a moderate temperature in tin, sealed from the air, and it will remain sweet as long as is usually necessary. It will be well for one who intends to try the perfume industry to secure a sample of the French pomade from some perfumer, so that an idea may be had of the strength of odor desired in the market. The prospect of success offered by this industry can only be learned by experiment, but it is certain that no careless methods will answer. As in other things, there is room at the top, and high class products are certain of a market.

DISINFECTANTS.

A DOCTOR'S CONCLUSIONS AFTER A LONG SERIES OF EXPERIMENTS.

There is one question that has often been put to me by doctors or laymen. It is: "Which is the best disinfectant?" The question is precise, but the reply is far from easy, nor can it be of such a simple character, writes Dr. Paul Gibier in the New York *Herald*. To begin with, we must ask for what purpose the germicidal agent is to be employed—whether for the rooms of the sick, the closets, the stables, or for the sick themselves, and, if this be the case, is the germicidal agent to be employed internally or externally? It seems possible that some product might be discovered capable of being applied in every kind of disinfection. But it must be confessed that up to the present such a chemical compound has not been discovered, and it would be actually impossible to use as a dentifrice the same antiseptics which are in vogue for human habitations for instance. Before entering more deeply into the question, it can be stated that each special case demands a particular "bactericide." To begin with, let us look into methods of disinfecting houses in times of epidemics. A great number of chemical bodies, solids or liquids, were formerly employed, but since we have been able to experiment directly upon contagious germs, as in the case of cholera and typhoid fever, we have, by the result of most disappointing experience, been compelled to reject as absolutely inefficacious the great number of well-known disinfectants, such as the sulphate of copper and the sulphate of iron. It would be decidedly out of place in an article such as this to cite the researches made by original investigators to investigate the value —more or less great—of disinfecting agents considered as such. It will be sufficient for me to say that after the experiments to which I allude, as well as from my own experiments, I shall limit myself to advising those means and methods that I employ myself, which I consider the most simple, the most efficacious, the least dangerous, and at the same time the most economic. In the laboratory which I direct there are always over a hundred animals being experimented with. It has been necessary for me to have recourse to this method of sanitation, and I will say here that after my experiments and researches I find that the chloride of zinc somewhat acidulated is the most satisfactory disinfectant. In the middle of summer add to the chloride of zinc a small quantity of chlorohydric acid (4 per cent.), and one may stay in the apartment where the animals are without being aware of their presence by their scent. This substance, which I indicate and advise for disinfecting purposes, can be utilized in the closets, for utensils, and for the rooms of the sick. The price is very moderate, and the solution is without danger and does not hurt the furniture It now remains for me to speak of antiseptics applicable to personal use. For external use, for the ordinary toilet purposes, I cannot too strongly advise against the use of any chemical compound. Pure water is the best disinfectant there is as long as we have no organic disease to deal with. I have often used carbolic acid and the bichloride of mercury, and, despite the dangers of intoxication, which one must watch in special cases, I use them still. But, in consequence of certain experiments which have been made in my laboratory and in the dispensary of the New York Pasteur Institute, I now employ almost exclusively for the wounds of bites the peroxide of hydrogen. This chemical compound was discovered three quarters of a century ago. Still it is only quite recently that its extrordinary qualities have been studied. The peroxide of hydrogen is a chemical body, a liquid, of the most remarkable character. Its composition is the same as water, with this difference, that instead of being composed like water of two atoms of hydrogen and one atom of oxygen it contains an extra atom of oxygen. Now, strangely enough, oxygen, which is necessary to the functions of life—of the being in general and of certain microbes in particular, but not of others—becomes an agent of destruction for these very same microbes the moment it is present in excessive quantity. The peroxide of hydrogen, which is a sort of concentration of oxygen, is an energetic antiseptic, and in my experiences I have been enabled to prove that when used in a degree of concentration absolutely inoffensive for the tissues of the human body it destroys almost instantly the microbes of hydrophobia, of typhoid fever, of cholera and a quantity of other bacteria. Its action upon the wounds is exceedingly healing and curative. I am convinced that a number of cases of diphtheria could be cured radically in their beginning if the diphtheretic membranes were impregnated with a powerful bactericide, which was at the same time a non toxic. To resume and to refer in a few words to the question that is so often addressed to me and to others, "Which is the best disinfectant?" I would say for objects the chloride of acidulated zinc, and for persons the peroxide of hydrogen, which is at once a most powerful antiseptic and completely innocuous in its workings.

CONSUMPTION AND CARELESSNESS.

Though Professor Koch's famous discovery is far from complete, he has more than demonstrated that the chief cause of the long list of diseases known under the general name of consumption is a microscopic organization, so low as to be neither animal nor vegetable, and that underc onditions of ill-health or impure blood this bacillus or microbe is born, thrives and multiplies at the final expense of the life of the unfortunate being in whose body it finds a receptacle. The value of the researches of the great German physician can never be over-estimated, and place him on a par with Harvey, Hunter and Jenner, Lister, Welles and Pasteur. While he proves that the disease under its many forms can be successfully resisted and in most cases cured, he shows, what is of greater utility, that consumption almost invariably begins when the system or the blood alone is surcharged with humors and per contrary that the malady never comes into being when the blood and system are in their normal state and surrounding. It is not known exactly how the disease begins. There must be a tissue full of impurities to be acted upon and a microbe to act. Whether the latter is brought by the air we breath, or the water we drink, or whether it obtains entrance through the skin and so reaches the circulation. Judging from common-sense it would seem that in Phthisis, the germs are conveyed by the air; in consumption of the stomach and liver from germs contained in our food and drink, and in lupus from germs which have effected a lodging within the outer skin. In all these cases, no matter how much they vary in degree or kind, one fact is always patent, the tissue attacked and the blood are unhealthy and are contaminated with the humors of the physical system. It is this which renders a person so easy a prey to his minute enemies. In a condition of fine health, nature resists a microbe the same as one would a wildcat. In ill-health, there is no energy wherewith to resist the attacks of foreign elements. The system yields to the first-comer. If the impurities are still larger in amount, what is called a typhoid condition obtains. Under this state of affairs a slight ailment becomes fatal and the smallest attack of a microbe becomes a galoping consumption. Prof. Koch's studies have shown that every one runs the risk of consumption who permits, through thoughtlessness, his system to become surcharged with impurities or is compelled against his will to undergo that process by the power of some other disease. So far as the germs are concerned, they are well-nigh universal. Only on the summits of high mountains are they unknown. On the ocean they are not, but they may be found in every ship and steamer that leaves port. In high dry atmospheres like those of Denver, Quito, and many places in Switzerland they are comparatively rare. In every other place they abound in exhaustless swarms. Wisdom, therefore, should oblige every person to keep his blood so pure that the germs of consumption can obtain no foothold within his organization. It is the duty of the individual toward himself and still more the duty of the parent toward a child. This should be done by the regular use of Ayer's Sarsaparilla, a simple scientific preparation, which, for forty years, has been recognized in America and Europe as the best if not the only blood-purifier in existence. Its action is rapid, but imperceptible so far as unpleasant sensations are concerned. Its virtue lies in the fact that it attacks the humors in the circulation and tissues, breaks down or destroys them and expells what remains through the lungs, pores, kidneys and bowels. At the same time it exerts a strong tonic influence upon the great functions of the body and changes morbid, inactive or torpid condititons into those which are normal, active and efficient. Whenever the system begins to run down, when people complain of "that tired feeling," when growing children lose their appetite or cannot sleep at night, it is a sign that the blood requires cleaning and that Ayer's Sarsaparilla should be employed to restore the individual to perfect health and strength.

BUSINESS NOTES.

BRAIN WORKERS

Use Horsford's Acid Phosphate. Dr. C. H. Goodman, St. Louis, Mo., says: "Have used it for several years with especially good results in nervous prostration, the result of mental efforts, also in sleepless conditions of brain workers."

THE FOOT OF A HORSE.—The foot of a horse is oue of the most ingenious and unexampled pieces of mechanicism in animal structure. The hoof contains a series of vertical and thin laminæ of horn, amounting to about 500, and forming a complete lining to it. In this are fitted as many laminæ belonging to the coffin bone, while both sets are elastic and adherent. The edge of a quire of paper, inserted leaf by leaf into another, will convey a sufficient idea of the arrangement. Thus, the weight of the animal is supported by as many elastic springs as they are laminæ in all the feet, amounting to apout 4,000, distributed in the most secure manner, since every spring is acted on in an oblique direction.

RIVERS FLOW "UP HILL."—All along rivers that flow toward the equator have the mouth higher, theoretically, than the source. The polar diameter of the earth is 7,899 miles, while the equatorial diameter is nearly 7,925 miles. Thus it is thirteen miles further from the centre of the earth to the equator than it is to either pole, so that it is steadily "up hill," theoretically, from the poles to the equator. The mouth of the Mississippi is more than four miles further from the centre of the earth than the source, or four miles "up hill." The explanation is that the same force—the centrifugal force of the earth—which caused the earth to "bulge out" thirteen miles at the equator, causes the waters of the ocean and rivers to tend toward the equator, so that the ocean, though it has a straight down grade of thirteen miles from the equator to the poles, has no tendency to run down hill, but merely keeps its apparent level surface. The rotation of the earth, therefore, makes the real "level of the sea" an inclined surface from the equator to the pole. If the earth did not rotate, the water would all flow the other way.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

HARTSHORN'S SHADE ROLLERS.

Who has not blessed Mr. Hartshorn for his invention, which did away with the annoyances of the old-fashioned shades, which would never "stay but?" If we remember the multiform troubles with the original shades which we had to roll up by hand, tie, and then attempt to balance, and the first improvement upon these by the cord rollers, which, though a great step forward, gave us the dissappointing experiences of stretching cords and cords out of the groove, mounting on tipping chairs to get them in order again, we feel thankful for the ingenious invention of the spring roller. As Mr. Hartshorn was the pioneer, he has steadily kept his improvements in the van; and, despite numerous imitators, there is no better spring roller made than Hartshorn's.

WOMEN WORKERS.—In Germany more than 130,000 married women work in shops and factories.

AN ACTIVE CHARITY.—Berlin's Society for the Homeless sheltered last year 108,000 men and 15,500 women. Since 1870 the society has assisted, with lodgings, baths, breakfasts, and medicinal care, 2,209,000 persons.

CHESS REFORM.—Mr. John Bland, a chess player, broposes to revolutionize the game by making the board nine squares wide, and adding besides a pawn another piece, to be called the "Premier," possessing the combined powers of queen and knight.

LIGHT WIRES.—The overhead wires originally selected for the telephone service in London were galvanized, and weighed 224 pounds to the mile: but these are now replaced by silicon bronze, weighing 36 pounds per mile.

DEATH TO BUGS.—A new insecticide is the subject of a Florida patent. It is a compound of sulphur, caustic soda, chloride of sodium, nitrate of potassa and water, the invention including the process by which the sulphur is reduced from a solid to a fluid condition.

GERMAN STRIKES.—In 1890 there were in Germany 1,131 strikes, in each of which more than 10 men participated. The total number of strikers was 394,440. In 420 cases they were entirely unsuccessful; in 468 partially successful; in 187 they gained all they demanded.

ARTIFICIAL RUBIES.—Two chemists, Freny and Verneuil, who have been experimenting for several years in the production of artificial rubies, report that they have now overcome the dificulty that has hitherto prevented them from producing large rubies, and they can make them of reasonable size.

STRENGTH OF ALUMINUM.—Aluminum bronze of ten per cent. it is claimed, has a working strength of 310,000 pounds, as against 80,000 pounds for steel; hence, when the time comes, which cannot be far distant, for building bridges of aluminum or its alloy, we shall have a structure about one-third the present weight, and much stronger.

VALUABLE STUDY.—The *Chemical News* says: "Chemistry should be studied as a means of intellectual training. It teaches us the important arts of close and accurate observation, and of drawing correct inferences from the facts recognized." "These important arts can never be mastered by the most prolonged study of classics and mathematics." "Hence, if we regard education as intellectual discipline rather than the mere absorption of a number of facts, we shall find some one of the branches of natural and physical science absolutely essential and indispensable." "And under most circumstances chemistry will prove the most appropriate subject."

AMERICAN ENTERPRISE.—George M. Pullman has, it is announced, closed a contract to place a large number of sleeping cars on Australian lines. The fulfilment of this contract involves a novel scheme, for the carrying out of which the workmen in the little town of Pullman are busily preparing. The parts of the cars will be made here, of course, and then the whole outfit in sections will be shipped to Australia ready to be put together there. Mr. Pullman will send along a colony of his best artisans, and in a temporary plant to be put up near Melbourne, the finishing touches upon the cars will be put. The workmen who are being enlisted for the expedition go with the understanding that they will be absent at least one year.

CLEVELAND'S SUPERIOR Baking Powder.

The Official Reports of the
United States Government, 1889,
Canadian Government, 1889,

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, March 30, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	60c @ 70	
No. 1	55 @ 60	
No. 2	50 @	
No. 3 and Shipping	45 @	
Clover Mixed	50 @ 55	
Clover	4[illegible] @	
Long Rye Straw	80 @ 85	
No. 2 "		
Oat Straw	35 @ 40	
Wheat Straw	35 @ 40	

Receipts week ending March 28, as follows:

Via N. Y. Central	190 cars.
" West Shore	120 "
Other roads by Lighter, 34th Street	30 "
Total	340 cars.

Receipts this week have been somewhat heavier. The trade was quite fair, and stock on hand is no larger than it was a week ago. No. 3 on shipping shows a slight advance in price, but other grades remain about the same. Long Rye Straw, if very nice, would bring 90 cents.

THE CENTURY DICTIONARY comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to
THE CENTURY CO., 33 East 17th St, New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month,** and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions,** arranged for practical use; timely hints to **Housekeepers;** cheering and helpful talks with **Mothers;** valuable information for lovers of **Flowers;** a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

To Subscribers, Readers and Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

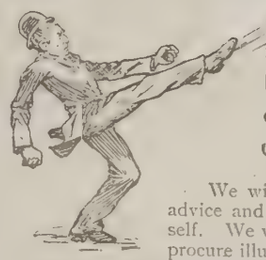
ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any newsdealer will take orders for it, the American News Company being our wholesale agents. All postmasters will receive subscriptions.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.



The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

BOGUS COFFEE.

The Report of the New Jersey State Dairy Commissioner for 1890, which we have just received, contains an interesting paper by Dr. Newton, the former Commissioner, relative to imitation coffee, an account of which has been given by the AMERICAN ANALYST. Some time in 1889 that official had been shown some samples of bogus coffee beans made in Hamburg, Germany. Learning that the article was soon to be introduced in large quantities in the United States, the Commissioner was on the alert, and so effective a look-out did he keep, that within two weeks after the material was offered for sale in his State, it had been detected and exposed, and driven completely out of the market. Trenton was the distributing depot, and the place of manufacture was variously attributed to Philadelphia, Jersey City, and New York, but has not yet been definitely ascertained by the authorities. It is believed that the prompt and decided action of the New Jersey Dairy Commissioner in January, 1890, crushed out the incipient fraud, not only in that State, but throughout the country, for since that period no complaint on the subject has been received from any source. The manufacture of imitation coffee, thus checked, is the first attempt to depart from the beaten track of adulteration. Prior to this it was the custom to mix ground rye, chicory, peas, etc., with ground coffee in varying proportions. In this instance an imitation article was made to mix with the coffee beans themselves, and as the public was taught that there could be no doubt of coffee bought in the bean, it is probable that large quantities could be sold if not early detected. The imitation coffee berries were a very close counterfeit of the real article, being of about the same shape, size, and color of the genuine, and to the casual observer they appeared the same. Close investigation, however, revealed the difference. The imitation berry was a little darker than the genuine, was heavier, had a closer texture, and lacked the thin fibrous skin that is found in the groove on one side of the true berry. The composition of the imitation article was never definitely determined, but it was probably flour or ground crackers or bread, formed in a mould and roasted or baked to the proper color. The samples found in Trenton were mixed with true coffee beans in the proportion of from thirty to sixty per cent.

TAKE CARE OF THE PENCE.

It would be a good thing for the community if people generally could realize the wonders that have been and that always can be accomplished through the accumulating of small savings. It is to promote the recognition of this that in several of our cities depositories have been established known as "penny banks," for the benefit of boys and others whose accumulations can only be measured, at the beginning at least, in coppers. New York, Boston, Baltimore and Detroit now have such "penny banks," or preliminary savings associations. They are established by benevolent citizens who associate themselves for that purpose, and are meant simply to help small savers in getting a start at the regular savings banks. The New York plan is this: The society or trustees having the matter in hand appoint certain local agents in different parts of the city, easily reached If a boy, or any one else, has five cents or one cent with which he wishes to start an account, he takes it to the office of one of these agents, deposits it, writes his name and address on a slip prepared for that purpose, and is given a stamp card on which his name is written and a five-cent or one-cent stamp, as the case may be, is pasted in one of thirty-six squares. Whenever the same depositor has another cent, or another nickel, he takes it to the same place and has another stamp, corresponding with the amount pasted in another square of his card. At last his card is filled, and then he receives the whole amount of his deposit, and is sent to the nearest savings bank to begin a deposit there. Once started in this way, he is likely to become a regular depositor. He may continue to go, however, to the "penny bank" with his coppers. The New York penny savings system succeeded in bringing out, in fourteen months, more than fifteen thousand dollars in deposits. It is probable that but for this system none of its money would have been saved at all, and much of it would have contributed to habits of spending instead of to habits of thrift. Several European countries have long had "penny banks" of this sort. Paris has more than two hundred offices or establishments for copper savings, and in thirteen years that they have been in existence fifteen millions of dollars have been saved through them. This is a vast amount, but a great number of people have contributed to make it up. In one year some sixty thousand children in Paris contributed thirty-four thousand dollars. All this money goes into regular and safe savings banks, and increases their deposits by more than the amount directly deposited by the "penny banks," since it starts accounts which would otherwise never be started.

ABRAHAM LINCOLN AN INVENTOR.

In connection with the forthcoming Patent Centennial, to which we referred in a recent issue of the AMERICAN ANALYST, the public will be interested to learn that Abraham Lincoln was an inventor, and received a patent on the 22d day of May, 1849, numbered 6,369, for an improved means of combining adjustable buoyant air-chambers with steamboats or other vessels to enable their draft to be readily lessened, to permit them to pass over bars or through shallow water without discharging their cargoes. These adjustable buoyant air-chambers were secured to the sides of the vessel (which in this instance was an old style Ohio steamboat), and were formed with top and bottom portions composed of a plank or plate of metal of suitable stiffness, and with flexible side portions of India-rubber, or textile material thoroughly waterproofed. These buoyant air-chambers were very similar in construction and operation to an accordion or a blacksmith's bellows. The vessel was also supplied with a main shaft or shafts, and with sliding spars or shafts, the latter passing down through the buoyant chambers and made fast to their bottoms; also with a series of ropes and pulleys, whereby, by turning the main shaft or shafts in one direction, the buoyant air-chambers would be forced downward into the water, and at the same time expanded and filled with air for buoying up the vessel by the displacement of the water; and by turning the shaft or shafts in an opposite direction, the chambers would be contracted into a small space and secured against injury. It is also stated that President Lincoln was the inventor of the very ingenious method of emptying boats of water

when they had become so filled that bailing was necessary. He bored a hole in the bottom of the boat and by heading the boat up stream in an opposite direction to that in which the tide was moving, a suction was formed which very quickly drew out the water through the opening bored in the bottom of the boat.

A KENTUCKY FIZZLE.

We had occasion a few weeks ago to refer to the *Aluminum Age*, an intermittent affliction to which the people of Newport, Kentucky, were threatened by one Charles L. Hartsfeld. The affliction, however, does not seem likely to trouble that community for any protracted period, as the third issue of the journal in question contains a pathetic appeal for somebody to come along and conduct its editorial management. A "trade journal of progressive information," that has no editor, and that publishes its advertisements gratuitously, as is the case with our esteemed contemporary, is not likely to prove a very remunerative nor a very long-lived enterprise. From present indications the earliest requirement of the concern, instead of an editor, will be for a coroner to sit upon its remains.

BATHS AND BATHING.

HOW TO PROPERLY APPROACH GODLINESS THROUGH THE PORTAL OF CLEANLINESS.

From earliest times bathing has been practised by nearly every people for cleanliness or pleasure. So great was the faith of the Ancient Jews in the importance of cleanliness for physical and moral well-being that bathing, washing and cleansing the body was enjoined upon them by the Ceremonial Law, and was practised as a part of their religious duty. The Ancient Greeks looked upon bathing as a means of retaining and restoring bodily vigor, and according to Homer, warm baths were used after exercise and fatigue. The earliest form of bathing was in plunging in running rivers, and was indulged in by all classes. Public baths were established originally by the Lacedemonians, who invented the hot air bath (the Turkish bath of to-day). Latterly these were adopted by the Greeks, and although they used them to a great extent, they were built on a small scale, as compared to the magnificent baths which eventually sprang up among the Romans. After the time of Maecenas, who built the first public bath at his own expense, each emperor, as he wished to ingratiate himself with the people, lavished large sums from the revenues of the State in the construction of public baths, which were fabulous in their extent and the beauty of their appointments. Many of these structures covered entire squares and were adorned with every architectural beauty. Within, were marble halls and colonnades decorated with the most beautiful frescoes and mosiacs by the masters. These buildings included not only bathing apartments, but gymnasia, libraries and, sometimes, theatres. The baths indeed became one of the greatest luxuries of the people; at one time no less than eight hundred public baths, or thermæ, as they were called, existed within the walls of the Imperial City. Wherever the Romans went and settled, they erected baths, and in many places where hot springs were found, they made use of the natural waters. The Mohammedans also adopted the hot baths and carried them into Spain. The Turks, at a later time, extended them on the Continent. At the time of the Reformation they are spoken of as being common in France, Germany and Belgium. Though these were, for the most part, hot baths, and were used as a luxury, cold baths, and the value of the different baths as a medicinal resource were not lost sight of, but were used more or less extensively in the treatment of diseased conditions. It is probable that many of these baths, especially those erected in the vicinity of natural mineral springs, never fell into absolute disuse, but that some of the celebrated baths of to-day are a direct outgrowth, or rather continuation of the original ones. To-day the high esteem in which the various baths are held by the medical fraternity as a therapeutic measure, is attested by the thousands of people who are sent each year to the renowned European springs to undergo the various "cures" for which they are celebrated. It is gratifying to us, as a people, to know that our own mineral springs, in the number and variety of which no country is richer than the United States, are being studied and developed. I predict that the time is not far distant when the medical profession of this country will have perfected their use to such a degree that they will be as well known and as widely used as in Carlsbad or Vichy. A bath, commonly speaking, is the immersion of the body in a medium different from that of atmospheric air. For medical purposes different media are employed, as hot sand, hot air or vapor, compressed air together with various other chemical solutions, either natural or artificial, and water of different temperature. The most common medium used is water, and the varied effects derived from the use of water depend upon the temperature and mode of application. In the use of mineral waters, the effect, of course, is largely obtained by the action of the mineral waters held in solution, but in the largest modern bathing establishments—as that at Richfield Springs—every facility is provided to enchance the natural effects of the waters by different methods of application. The first and common object of the bath is cleanliness. The great importance of abstersion, and the necessity of keeping the skin clean and in its normal activity will be more fully appreciated when we consider the importance of the function which the skin has to perform. One-third of all the morbid matter in the system arising from tissue change is thrown off through the skin, the other two-thirds being excreted by the kidneys and lungs. The excretion through the skin is accomplished by the action of about two and one half millions of little sweat glands. Each of these glands is surrounded by a plexus of blood vessels, and has a duct extending to the surface, the average length of which is one-fourth of an inch. The aggregate length of these ducts, as computed, is about ten miles. Think of it! A system of human sewerage *ten miles* in extent! The deleterious effect upon the organism caused by a stoppage of this great system of drainage will be perceived at a glance. The effete matters of the body, which in a state of health are excreted by the skin, nature now endeavors to get rid of through the kidneys and lungs. The effect on these organs of the great increase of functional activity necessary to maintain the harmony between tissue waste and tissue repair results in their disease, and the entire system becomes deranged from the poisonous effects of this accumulated matter. Then, too, in health respiration is carried on, in a measure, through the skin by the absorption of oxygen and the giving off of carbonic acid, thus aiding the lungs in their interchange of gases; in this manner a direct effect is produced upon these organs by a checking of the normal activity of the skin. For purposes of cleanliness the hot bath will be found to be of the greatest service. Friction of the body with soap will aid in dissolving and removing the accumulated matter which fills the mouths of the little ducts, and leaves them open and free for the egress of the natural secretions. This bath should be followed by a cold shower to restore the tone to the skin and avoid the depression which always follows prolonged immersion in hot water. Right here I wish to say a word to depreciate the pernicious practice indulged in by many of taking frequent hot baths. For the purpose just mentioned a hot bath is never necessary oftener than once or, at most, twice a week, provided a person takes a daily tepid or cold sponge bath, which should be indulged in by every one as a matter of health. Taken oftener than this, the hot bath is enervating and depressing. It produces a lowered state of vitality, which not only lowers the powers of resistance to disease, but may actually induce disease, by encouraging the development of any latent abnormal condition to which the person may be subject. Now as to the bath as applied for special purposes. The object of any bathing process is to transmit through the patient's skin stimuli to the central nervous system, and by these stimuli to increase arterial and muscular tenacity and encourage tissue metaphosis. This effect is produced by the employment of different degrees of temperature in such order and of such intensity as will produce the precise reaction desired by the physician and the avoidance of subsequent effects which may not be desirable. For convenience in considering the bathing process we divide it into three stages: 1st, *The preparation stage;* 2d, *The treatment stage;* 3d, *The reaction stage.* As the value of the different degrees of temperature varies with the activity of the cutaneous circulation at any moment, it is our object in the *preparation stage* to bring the skin into the best condition to receive the treatment which we propose to employ. Thus, in using the cold bath it is necessary to have the cutaneous circulation in an active condition, to avoid producing shock, and to ensure to our patient the reaction and consequent tonic effect which is the end desired. The very best means of inducing this activity of the circulation is exercise. The prevalent idea that one must wait after exercise to get "cooled off" before taking a cold bath is an erroneous one. As a matter of fact, after the cooling process there is a certain amount of enervation of the cutaneous capillaries, and the process of reaction is not only delayed but diminished in intensity. A distinction should be made, however, between the quickened circulation and glow of the skin after exercise and the overheated and fatigued condition following prolonged physical effort. In the latter case, the shock of the cold bath acting upon the overheated heart would be very apt to result in disastrous consequences, while in the former condition the skin is active and impressionable, and in the very best condition to receive the stimulus which the cold bath will produce. Various other means of preparation may be employed, but they should be adapted to the individual needs of the patient. In the hot bath it is usually desirable to begin the bath at a temperature some degrees lower than that which we desire to use, and approach the higher temperature gradually. In this way we shall avoid the shock which excessive heat would produce, and shall be able to reach a higher degree of heat than could otherwise have been borne. The *treatment stage* consists in the application of one or more of the various bathing processes by means of which we seek to affect the organism for given purposes. The method selected will depend upon the effect which we desire to produce. The class of cases which come under my care at Richfield Springs are for the most part rheumatic or gouty, or are some of the many forms of skin disease. The majority of these cases are treated by the full or tub bath of varying temperature. I find the various douches, however, to be of great service, especially in those cases in which there is a marked neurotic element. The other methods of treatment are too numerous to mention in this paper. Our object in this *reaction stage* is to ensure a tonic condition of the nerves and blood-vessels of the skin as a result of the bathing process. This may be accomplished by a separate bathing process, or by the manner of drying and caring for the patient after the bath. Attention to these details, simple as they seem, will have a very important bearing in determining the success of our treatment. A person should never stand upon a cold surface while the drying process is being carried on. A warm cloth should be provided, and will do much toward encouraging reaction. The exposure of the wet skin to the atmosphere of the room, and the consequent evaporation of the moisture, will retard and diminish reaction. It is necessary, then, after a cold bath to envelop the body in a hot sheet immediately upon coming from the water. The body can be dried by rubbing the hands over it outside the sheet. When the

skin is dry there is no danger in exposing it to the air, and friction is excited by rubbing it briskly with a rough towel. The reaction stage after the hot bath is of very great importance. Hot baths cause relaxation of the capillaries by over-stimulation, and the condition produced is one of partial paralysis; this state is very unfavorable to tonic reaction. The greatest caution should be exercised in employing the hot bath. The condition and temperature of the patient should be carefully looked into and the minutest detail of treatment zealously carried out if we would avoid doing harm. It is a glaring fault, in most bathing establishments where mineral waters are used, that too much dependence is placed upon the mineral ingredients of the water, and too little upon the details of their application. All patients of whatever condition or temperament are subjected to the same routine of treatment. Not only does this course fail to produce the good effect sought, but in many cases it works positive harm to the bather. The ill result following this hap-hazard manner of bathing is attributed to the peculiar action of the mineral matters which the waters contain, whereas the fault really lies in the lamentable ignorance of the director concerning the first principles of bathing. The daily bath, whether it be tepid or cold, should be carried out with the same attention to detail. Without it, we not only subject ourselves to actual danger, but what should be a pleasure becomes a distasteful task.

PURE FOOD IN EUROPE.

ABSTRACT OF THE BELGIAN ADULTERATION LAW.

On the 15th of January regulations fixed by the Belgian Legislature, having for their object the prevention of the adulteration of food products, went into force in Belgium. The first relates to the sale of artificial butters, otherwise called margarine, and stipulates that warehouses, shops, depots, as well as market stalls where margarine is exposed for sale, must present to the public view, in distinct and indelible characters, the inscription, *Sale of Margarine.* Casks, covers and receptacles in which margarine is placed for sale by a shop-keeper, or which are employed by the makers, wholesale dealers, importers, exporters, consignors and consignees of this product, must also bear, in distinct and indelible characters, the words *Margarine.* Further, if the margarine intended for sale is contained in cases, casks, or receptacles not opened, the inscription will mention the name or description of the maker. Articles and wrappers in which margarine is delivered to the purchaser by a retail dealer must bear, in distinct and indelible characters, the word *Margarine,* and the statement of the name or description of the seller must in the inscription immediately precede or follow the word *Margarine.* As regards consignments, the makers, merchants, consignors or consignees of the margarine must state on the invoices and way-bills or bills of lading for each individual consignment that the merchandise despatched is sold as margarine. If the margarine is sold or exposed for sale in the form of cakes or loaves, these must take the form of a cube. They must be marked, moreover, with an imprint bearing the word *Margarine,* as well as the name or description of the maker, unless the receptacles themselves bear these indications. The second of these regulations relates to the sale of food products containing saccharin. It provides as follows: 1. Under the name of products in which saccharin enters (*produits saccharines*) is understood any commodity sweetened by the aid of matters of which the chemical composition and physiological properties differ entirely from those of common sugar, or sugars derived from amylaceous substances (maltose, glucose). 2. Proprietors of breweries, glucose factories, confectionery establishments, factories of liquors, chocolates, and other food products, who use saccharin in their manufacture, are obliged to have the following words painted in large characters, *Saccharin products* (*produits saccharine*) on the outside of the principal entrance to their works and warehouses. Warehouses, shops, depots, as well as stalls and all places of sale where saccharin products are exposed for sale, must exhibit in a conspicuous place, in distinct and indelible characters, the words *Saccharin products.* 3. Casks, covers, or any receptacles in which saccharin products are placed for sale by a dealer, or which are used by the makers, wholesale merchants, importers, exporters, consignors and consignees of these products, must also bear, in distinct and indelible characters, the word saccharin. Further, if the product containing saccharin intended for sale is contained in cases, casks, or receptacles not opened, the inscription will mention the name or social position of maker. 4. Receptacles in which the product containing saccharin is delivered to the purchaser by a retail trader must bear, in distinct and indelible characters, the word saccharinated (saccharine), as well as the name or social position of the trader or retailer. 5. As regards consignments, the makers, merchants, exporters, or consignees of the products containing saccarin must indicate on the invoices and way-bills or bills of lading, for each individual consignment, that the merchandise exported is sold as a product containing saccharin. Two other sets of regulations, which come into force on the 1st October, 1891, deal with the artificial coloring of food products and with the utensils, etc., used in the industry and trade in food products. The first stipulates as follows: It is forbidden to use for the coloring of food products, such as bonbons, pastilles, sweetmeats, pastries, food pastes, confections, marmalades, sirups, liqueurs, wines, fruits, vegetables, etc., intended for sale, any poisonous coloring matter. A list of harmless coloring matters, and a list of colors considered as injurious, will be published by the ministry of agriculture, industry, and public works. It is forbidden to sell, to expose for sale, to detain or to transport for sale any food product manufactured or prepared contrary to the above regulations.

The receptacles or wrappers in which colored or artificially colored food products are contained for sale, either wholesale or retail, must bear, in plain characters, the name and description as well as the address of the seller. The second set of regulations prohibits the use, for the preparation, preservation, or packing of food products, intended for the sale of these commodities, of any utensils, receptacles, or different objects containing any properties which by contact with the substance they contain become poisonous or injurious to health. Lead and zinc, as well as alloys, platings, soldering, and enamels containing these metals, arsenic, antimony, or their compounds, must especially be considered as poisonous or injurious to health in the sense of the present regulations. The above regulations are not applicable to preserve boxes of iron plated with pure tin, of which the solderings are external and are made of an alloy of tin and lead in the proportion of a maximum of ten per cent. of the latter. It is forbidden to sell, to expose for sale, to detain, or transport for sale prepared food substances, preserved or packed in any way contrary to the disposition of the present regulations. It is forbidden to sell, to expose for sale, to detain or transport for sale apparatus, utensils, or articles intended for the preparation, preservation, packing, sale, or manipulation of food products, of which the use is forbidden by the preceding articles. Any apparatus, utensil, receptacle, or article, of which the parts placed or likely to be placed in contact with food products in a factory, warehouse, or store of the commodities contain tin, metallic alloys, enamels, or coloring materials, must bear, in legible characters, the name or position as well as the address of the maker. Contraventions of the law will be punishable with fines prescribed by the law of the 4th of August, without prejudice to the application of the penalties prescribed by the penal code.

WHAT MAKES BEAUTY?

WILL EDUCATION AFFECT PHYSICAL APPEARANCE TO ANY EXTENT?

"What makes beauty?" is the question asked by the London *Spectator.* Beauty is a result of race, of circumstances, such as personal freedom and mode of life, and continuous diet, not of intelligence, and still less of acquisition of knowledge, which latter can benefit only the individual whose features are fixed past serious change before study is even begun. A man or woman inherits his or her face, and mental habitude, though it may affect its meaning, cannot alter its shape. It may even be doubted, strange as many will deem the assertion, whether continuous education will produce beauty, whether the growth of intelligence will even in ages yield the physical result which we notice the authors of Utopias always assume, as if it were a scientifically demonstrable consequence of the new society. The most beautiful black race in Africa, a tribe in Nyassaland, on whose looks even missionaries grow eloquent, and who are really as perfect as bronze statues, are as ignorant as fishes, and, though they have discovered the use of fire, have never risen to the conception of clothes of any kind. The Otaheitan when discovered was as uncultured as the Papuan now is, yet the former approached as nearly to positive beauty as the latter does to positive deformity. The keenest race in Asia, and, as all who know them assert, the strongest in character, the Chinese, is decidedly the ugliest of semi-civilized mankind, while the Hindoo, if sufficiently fed is, even when as ignorant as an animal, almost invariably handsome. The Circassians, who know nothing and are rather stupid than exceptionally intelligent, are physically a faultless race, far more so than the Germans, who, though the best trained people in the world, display a marked commonness of feature, as if the great sculptor, nature, had used good clay but taken no trouble about the modeling. Some of the ablest among them belong to the flat-nosed, puffy cheeked, loose lipped variety.

STOMACH CRANKS.—The London Vegetarian Society reports a membership of 541, but the movement is said to have spread throughout England, Europe, and the colonies.

THE GERMAN MARINE.—Germany's merchant marine comprehends 3,594 vessels, with a registered tonnage of 1,320,721. Six years ago the figures were respectively 4,257 and 1,294,288. The number of sailing ships has fallen during this time from 3,607 to 2,779, and the number of steamships has increased from 650 to 815.

SENSIBLE SUGGESTION.—A German physician proposes that the manufacturers of preserved meats should be compelled to stamp their cans with a legible date mark. For a year or so, he says, canned meats may remain perfectly wholesome, but after that they deteriorate in a way defying alike precaution and explanation.

PENNY-SLOT PAPER.—The Compagnie Générale des Voitures, of Paris, are about to start a paper entitled *Paris Voiture,* which will be procured by putting a two-sou piece in a slot in every cab. The paper will contain the bills of the theatres, a few illustrations, and tips for the races. The purchaser will also be insured during his drive.

GAS AND BRICK.—Measurements made at some of the brick-yards in Findlay, Ohio, indicate that the amount of gas used to burn a thousand brick is 7,500 cubic feet, independent of the amount used for power in preparing the material. The rates have been as follows: For brick burned in open kilns twenty-five cents per thousand, and for brick burned in closed kilns twenty cents per thousand. At Fostoria the rate is fifteen cents per thousand. At Tiffin the rate has been fifty cents per thousand. The charge for seven drain-tile kilns at Tiffin is $50 per month. It is estimated that the consumption of gas in brick-making alone, at Tiffin, is not less than 1,000,000 feet per day during the busy season.

CHEMISTRY OF THE SUN.

MYSTERIOUS ABSENCE OF OXYGEN, NITROGEN, AND CHLORINE.

In connection with the photography of the solar spectrum, considerable advances have been made in the recognition of the chemical elements present in the sun. Copper, silver and vanadium have been transferred from the list of the doubtful metals there to the certain; and very recently Rowland has found clear evidence of the presence of silicon, the apparent absence of which has been long a standing puzzle. The evidence in favor of the presence of carbon also seems to gain strength, and the same is true in the cases of aluminum, cadmium and zinc. The fact that the lines which reveal the presence of silicon are almost entirely in the ultra-violet, invisible portions of the spectrum, warrants the expectation that photography may soon find there evidence of some of the other still missing elements, such as boron, phosphorus and sulphur. But no new light yet appears in reference to the mysterious absence from the sun of oxygen, nitrogen and chlorine, which play so important a part in the chemistry of the earth; except, indeed, that the results obtained by Janssen last summer, on the summit of Mont Blanc, are conclusive that the great "B" line of oxygen, which is so conspicuous in the solar spectrum when the sun is near the horizon, is entirely of earthly origin, and not in the least solar, writes Prof. Young of Princeton to the *Youth's Companion*. The veteran astronomer, still enthusiastic and full of pluck, though unable to endure any severe physical exertion, had himself carried by a small army of guides and porters to the very summit of the mountain, and there obtained decisive observations. As regards the "photosphere"—the luminous surface of the sun—and sun-spots, there is little news to note. Janssen at Meudon has made real improvement in the processes of photographing the spots and the details of the solar surface; and recent observations of the displacement of the lines of the spectrum at the eastern and western edges of the sun, made by Duner of Upsala, have confirmed the laws of the sun's swifter rotation at the equator—a law which, though first discovered more than thirty years ago, has recently been called in question. It still remains as much a mystery as ever how the great cavities which we see as spots come to be formed in the sun's surface, why they are so limited to the two zones on each side of the sun's equator, and why they show such a regular increase and decrease in numbers every eleven years.

POWER OF WATER.

WONDERFUL FORCE OF WATER USED IN HYDRAULIC MINING.

An editorial writer in the N. Y. *Sun* states that about six months ago there was a dinner party at Gen. Schofield's house in Washington. Among the guests were President Harrison, Chief Justice Fuller, the late Secretary Windom, Speaker Reed, Senator Sherman and Senator Stanford, and Mr. Justice Stephen J. Field. During the dinner the conversation turned upon mining operations in California, and Judge Field, whose knowledge of all matters relating to the Pacific coast is as extensive as his powers of narrative are entertaining, astonished the distinguished company by some of his assertions in regard to the force of the jets of water employed in hydraulic mining. He described the wonderful manner in which the streams from the hose cut to pieces and tear down the hills that hold the precious metal. Judge Field cited the Hon. James G. Fair as his authority for the statement that under a vertical pressure of one or two hundred feet the force of the stream is sometimes so great as to hurl away or hold boulders weighing a thousand pounds; and that it would be no more possible to cut through such a stream with a crowbar or an axe, where it issued from the nozzle, than to sever eight inches of solid iron with a penknife. As Judge Field afterwards informed Senator Fair, in a letter asking for expert testimony about the power of water applied by hydraulic machinery, these assertions were received by some of Gen. Schofield's guests with smiles of polite incredulity. The eminent jurist felt that his position, for the moment, was somewhat like that of the Englishman who informed the King of Siam that in England water often became so hard that people could walk on it. It is not at all surprising that the facts gravely alleged by Justice Field should stagger even an imagination like the Chief Justice's, or strain the faith of so profound a believer in dynamics as the Hon. Thomas B. Reed. In consequence of this incident, and for the vindication of his own reputation for veracity, Judge Field has collected from several of the highest authorities on practical hydraulics evidence and opinions that are of great interest. Ex-Senator Fair tells Justice Field that at the Spring Valley gold mine in Cherokee, California, the water used in the hydraulic mining operations was brought in pipes and ditches from a distance of nearly one hundred miles, and that the volume of water used on every working day in that mine amounted to three times the number of gallons consumed daily by the entire city of San Francisco. Mr. Louis Glass, for sixteen years the Superintendent of the Spring Valley mine, assures Justice Field that he has seen an eight-inch stream, under 311 feet of vertical pressure, move in a sluggish way a two-ton boulder at a distance of twenty feet from the nozzle; and that the same stream striking a rock of 500 pounds would throw it as a man would throw a twenty-pound weight. "No man that ever lived," adds Mr. Louis Glass, "could strike a bar through one of these streams within twenty feet of discharge; and a human being struck by such a stream would be killed—pounded into a shapeless mass." Mr. Augustus J. Bowie of San Francisco, the author of a standard book on hydraulic mining, estimates that the stream from a six-inch nozzle, under 450 feet vertical pressure, delivers a blow of 588,735 foot-pounds every second, equivalent to 1,070 horse-power. "It is absolutely impossible," says Mr. Bowie, "to cut such a stream with an axe, or to make an impression on it with any other implement." Mr. Bowie adds that although never to his knowledge has a man been struck by such a stream as it comes from the pipe, several accidents have occurred where miners were killed by very much smaller streams at distances of 150 or 200 feet from the nozzle. After an elaborate series of computations, Prof. Samuel B. Christy, of the University of California, an eminent authority on mining and metallurgy, reports to Justice Field that if a nozzle of from six to nine inches diameter were specially arranged to throw a stream vertically upward against a spherical boulder of quartz weighing 1,000 pounds, the vertical head being anywhere from 100 to 500 feet, the boulder would be forced up until the diminished velocity of the stream established an equilibrium of pressures. There would be a point at which the upward pressure of the stream would exactly balance the gravity pressure of the boulder, holding it, the half-ton rock, there suspended. In practice, of course, the boulder could not be balanced accurately upon the axis of the stream, but would fall to one side or the other. But if a large conical basket of iron bars were arranged about the nozzle, so as to catch the boulder whenever it should be deflected from the stream and return it to the nozzle, the 1,000 pounds of quartz would be kept in play like a ball in a fountain. As to cutting these streams, Prof. Christy says that he has often tried to drive a crowbar into one of them. The stream felt as solid as a bar of iron, and, although he could feel the point of the crowbar enter the water for perhaps half an inch, the bar was thrown forward with such force that it was almost impossible to retain it in the grasp. An axe swung by the most powerful man alive could not penetrate the stream; yet it might be cut by the finger of a child, if the child were seated on a railway train moving parallel with the stream in the same direction and with the same velocity. That velocity would be considerably more than a mile a minute. Justice Bradley of the Supreme Court has also tried his intellect upon the mathematics of the problem submitted by Judge Field. He delivers this opinion: "I can well believe all you say with regard to the tremenduous force of streams issuing from the pipes of the miners under a large head of water. Of course they would produce instant death if directed against a man standing near, and would probably cut his body in two." The statements here presented in summary will not astonish engineering experts or members of the New York Fire Department. The average citizen, however, is accustomed to regard water as the least destructive liquid that can be put in motion, and he is familiar with no stronger manifestation of its power than the velvety touch of the stream from the croton faucet. We should say that the distinguished Californian upon the bench of the Supreme Court had amply vindicated his right to be heard with respect and perfect confidence by any dinner party on the subject of hydraulic pressure. Does it occur to Gen. Schofield that in these facts there is the suggestion of a novel and most terrible engine of military defence against assaults at short range?

THAT OTHER FELLOW.

HOW MEN OUTGROW AND FORGET THEIR EARLIER SELVES.

The following passage from "The Listener's" column in a recent number of the Boston *Transcript*, will strike a responsive chord in the minds of probably all our readers who have reached that period of life when retrospection becomes at once curiously painful and irresistible: "It is a rather interesting thing to come upon a scrap of one's handwriting, buried between the pages of an old book, where it has lain for so many years that one is almost afraid of it, as if it were a kind of Doppelgänger, or duplicate of one's own self—or, if not so bad as that, an accuser of more years than one likes to be charged with. It is singular how one may change, in a dozen years or so, his manner of forming his letters, and yet write very much the same hand. Can it be possible that the person who made a capital T with that ornate twist on the left-hand side of the up-and-down part, and whose C was merely a downward stroke, but who made a very ornamental capital J—really the most difficult of all the letters in the alphabet to write—was the same person as the one who now pens these extremely commonplace characters, and yet that this present writer's hand should bear so strong a resemblance to this admirable original? One never feels so much like two people as he does at the moment of such a discovery. It is worth while, as one sits contemplating this old scrap of handwriting, to pretend that he is two people, like Alice in Wonderland, and to speculate as to what sort of a fellow that other one was that penned the old fragment. The more you think about it, the more you are convinced that that other fellow could not have been this one. All ordinary means of identification fail to prove him the same person. He did not know the people that you know now. He had never read half the books you think about now, nor seen the pictures that you so greatly admire, and he did not know the tunes that chiefly run in your head. He had never been to the places that have exercised a profound effect upon your imagination and your ideas. If you catechise him, you find that he entertained some queer notions, in that time long ago, that you utterly repudiate, and held in scorn certain other notions that have become as dear to you as the apple of your eye. He had not an inkling of the issue in some of the great literary and artistic problems that you wrangle about now. A queer fellow, all around, in so many respects foreign to you that you disown him on the spot, and

wonder how the deuce he came to counterfeit your handwriting so cleverly. And yet, if you try to shake him off, you cannot do it. These new thoughts that you are thinking now were thought by him in some shape then. This book that you swear by is only the echo of that other one which that fellow was very familiar with. This intensely modern concerto that rings in your ears, and for the moment seems to make all other music dull, had its prototype in something he knew; this beautiful picture existed before in another one. In short, this other fellow follows you up at every moment; when you run, he runs, and if he stops when you stop, it is only to start again the moment you put a foot forward. He had the same sense of being unhappy at that moment, and of always easily remembering the time when he was happy and didn't know it, that you have; and his photograph, if you happen to come upon it, with all its look of being another fellow, has that identical mole on the left cheek. It is a queer problem, with two conflicting solutions, each demonstrable!"

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

CURRIED FISH.—Fry a small chopped onion in two tablespoonfuls of butter, when partly done add two teaspoonfuls curry powder; cook for a few moments then add two good cupfuls of cold fish, freed from all skin and bones; stir well and cook for a few moments; season with salt and pepper. Serve on a hot dish with a border of boiled rice.

BROWN SOUP-STOCK.—Take four lbs. beef, which may be from the shin or any inferior part of the beef so that it be lean, cut it in pieces, and put it in the soup-pot with a good sized lump of butter and just enough water to prevent its burning, add to this a pound of lean bacon cut in slices; cover closely with a lid and cook gently until the gravy is extracted, then add three onions, a few whole cloves, some sweet herbs. Cover with boiling water and stew until the meat is very tender. This will form the foundation of many soups and gravies.

ONION SAUCE.—Peel some small onions and boil until they are quite tender, drain and chop them, add some melted butter, pepper, salt and a little milk, boil up once—thicken with a little flour if it seems too thin, and serve with roast mutton, veal or game.

CRAB CROQUETTES WITH PEAS.—To one pound of crab-meat (procured at Fulton Market, all ready for use, at forty cents per pound) add half a pint of soaked bread-crumbs, a teaspoonful of chopped parsley, two saltspoonfuls of salt, a heaping tablespoonful of butter, the yolks of two eggs, and a dash of cayenne. Mould together, and if too dry add a little water; then put it in the ice-box until wanted. Before the meal roll into cork shapes, dip in heated egg and crumbs, and fry in smoking hot fat. Let stand on a thick towel to drain a moment; put them on a dish, surrounded by a border of French peas, and serve.

CHEESE FRITTERS.—Make a batter of two tablespoonfuls of flour, the yoke of one egg and enough milk to make it the right consistency. Add two large tablespoonfuls of Parmesan cheese, pepper and salt to taste, and the whipped white of an egg, also a dash of cayenne. Mix well and drop by spoonfuls into boiling lard and fry a golden brown; drain, and serve immediately.

SHREWSBURY CAKE.—Beat to a cream one pound powdered sugar and one pound of butter. Beat very light, without separating the yolks from the whites, four eggs, add to them one-fourth teaspoonful nutmeg, a little mace, and one teaspoonful cinnamon. Add to the butter and sugar and beat thoroughly. Flavor with the juice and grated rind of a lemon and orange. Beat well, add gradually one and one-half lbs. flour, roll out, cut into little cakes, and bake on buttered pans in a quick oven.

HOREHOUND CANDY.—Boil one-half ounce of dried horehound in one pint of water for twenty minutes, strain through a fine sieve, and add one and one-half pounds sugar and one-fourth teaspoonful cream of tartar. Boil without stirring until it cracks in cold water; pour out in very thin sheets on buttered tins and mark off into little squares.

EATING AND LIVING.

OVER-FEEDING STARVES THE BRAIN.

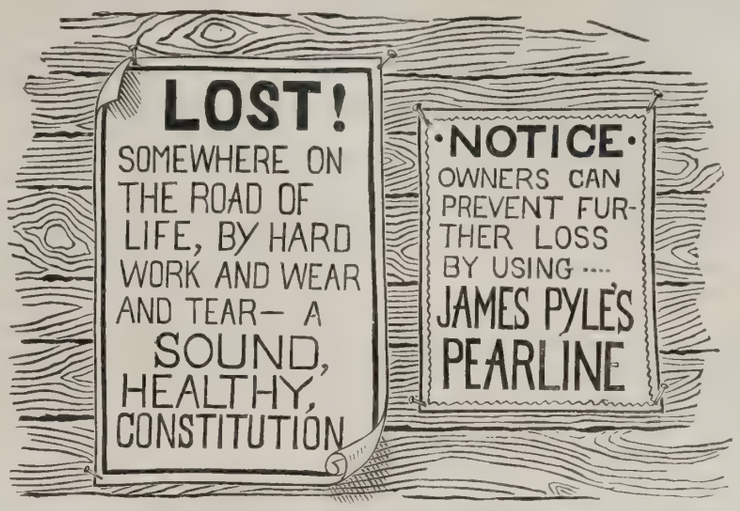
A correspondent of the London *Truth* says: the persons living to a green old age who have come within the range of my observation were abstemious themselves, and had either sprung from poor families or came from the South, where heavy meat meals are not enjoyable. Guizot, who was not a vigorous trencherman, started in poverty, and was a Southerner. Thiers started in the same condition, ate twice a day and very heartily, but was so heavy after eating as to be obliged to go to sleep. He died of apoplexy after eating. I attribute the extraordinary difference in quality in the early and late works of Victor Hugo to his having only scant meals when he wrote the former, and to his having plentiful and delicious ones, to which he did the fullest justice, when he turned out the latter. Victor Hugo was *spirituel* before lunch or dinner; he was inflated in speech and bereft of all sense of the ridiculous when digesting either repast. M. de Lesseps is almost Oriental in his abstemiousness at table, he being of a Southern family, and having lived long in hot countries, which are as healthy as any to those who adapt themselves to the climate. I dare say he owes his longevity and high spirits to his sobriety in food as well as in drink. Volumes have been written against drunkenness. But any doctor who understands well the human frame will tell you (if he can cast aside humbug) that drink is not as bad in its effects as gormanizing. Nothing so hastens senility as the latter. Barthelémy Saint-Hilaire, though eighty-four, works as hard and with as little fatigue as he ever did in his life. Twenty years ago he said to me: "I am persuaded that the civilized man eats three times more than what he needs when he is not checked by poverty. For my part I was too poor until I was elderly to be a gourmand, and when I now go to dine at a friend's house I only play with my knife and fork. Dinner is a mistake." The Czar, his brothers, and his uncles are all gormandizers, and what a heavy, wearied lot they all look, unwieldy as megatheriums, and about as intelligent. I have never doubted, since I began to think upon the subject, that George III. ate himself into the mad doctor's hands, and Louis XVI. into semi-imbecility. Who were the great victors of the eighteenth century? Voltaire, who lived on coffee, and had too weak a stomach to bear much food; Washington, who was spare and abstemious; and at the Revolution, the people of Paris, who were starvelings. Stanley greatly explains his success when he says that all he wants is a crust of bread, a mouthful of meat when he can get it, and a cup of tea. The Scotch were a proverbially hungry people when they turned India into a British dependency. I have been discussing the dinner question with a Jew, aged eighty, who is an enthusiastic Mosaist. He himself ate the *vache enragee* until he was five-and-twenty, and thinks it was the making of him. The reason he gave why his brethren bear so well all climates is that they spoil their meat when they prepare it according to the prescriptions of their religion. It is first bled, and then steeped in salt and water until no redness stains the water. This unfits it for the spit or the grill, and does not make it toothsome in a stew—the only way in which it can be done, unless boiled. Meat thus prepared has no savor, and does not tempt the Jew to eat of it gluttonously. Dying of apoplexy does not much matter, since every one must die of something. But, as my aged Hebrew friend observes, it does matter to be for years in a state that ends in apoplexy—to wit, with a starved brain. The brain starves in the midst of too great plenty, because gormandizing clogs the capillary arteries which bring life to the brain substance. The blood does its best to do its work, and in its efforts at last bursts a vessel. I once knew an impressario who was also a Jew. He was behind any number of lyrical theatres, from Stockholm to Sydney, cafes-concerts, music halls, and other places where singing was the attraction. He held carnivorous feeding in horror, and told me that he never lost his time seeking for fine voices in countries where a fish or a meat diet prevailed. The most fish-eating Italians—those of Naples and Genoa—have often among them sweet singers. The most meat-eating part of Great Britain—England—is also a voiceless country. Though the singing is so fearful in the Scotch kirks, my friend found some divine songsters south of the Grampians, and a greater number in the Highlands. He often heard common Irish women "lilt" and sing like nightingales, but never in the towns. Sweden was a country of song, because a country of grain. Norway was not. Too much fish was eaten there. Vocal capacity disappeared in musical families who got rich. They ate too much meat. The vocal birds are eaters of grain, fruit, and vegetables. No carnivorous one could ever sing a song. It croaks, has a bad liver, and is generally melancholy.

ANCIENT VERTEBRATES.

THE OLDEST REMAINS YET DISCOVERED IN THE WORLD.

It ought to be of interest to every person in the United States to learn that within the last few days the Smithsonian Institution has discovered near Trenton, N. J., remains of animals with backbones more ancient by hundreds of thousands of years than have ever been found in any other part of the world, as a *Star* reporter is informed. Up to the present time the palæontologists of Great Britain have been crowing over those of America on the strength of the superior antiquity of their vertebrates. Experts in the science of the distant past on this side of the water have reluctantly yielded the palm in this respect to Europe. But now the situation is reversed and there is evidence to offer that vertebrate creatures existed in this very neighborhood ages before they have been proved to have lived on the other side of the world. Some notion of the antiquity of these remains may be had from the fact that the backbones, ribs, and other animal relics of which they are composed once formed portions of the anatomy of creatures that lived and swam in the earlier part of the epoch when the coal was deposited in the beds where it is now found and mined.

These fragments went to make up sharks that navigated the seas of millions of years ago, or sheathed the bodies of strange fishes that were clad in armor plate, as turtles are to-day. Now they are dug out from a stratum that lies beneath thirty-five miles of sedimentary stuff deposited by water. Volcanic action has turned a section of the earth's crust over upon its side near Trenton, so that what was in times past at a great depth is now exposed on the surface to the hammer of the geologist. It is partly through studying such accidental formations that mankind has learned its own ancestry. What lends particular interest to these vertebrates of the early coal-forming epoch is the fact that they are the ancestors of mankind. It is from them that we are all descended, science says, though, of course, they were not our earliest progenitors. Going back of and beyond them we find our more remote grandparents in marine worms. This seems unpleasant, but it is a demonstrated fact. Originally animate creation divided itself into two branches—the animal and the vegetable. The plants developed away from mental organization, assuming the condition of stationary parasites upon the earth. On the other hand the animals cultivated powers of locomotion, so that they were able by moving about to control their own environment. The vegetables performed the labor of gathering from the mineral kingdom food for the animals, so that the latter were enabled to devote all their energies to the cultivation of their powers and the improvement of their species. In this way it has come about that animals have steadily advanced since the time of the beginning of things, until man has been produced. From the worms of the seas came the original vertebrates, which resembled worms in appearance, but had backbones. Out of these creatures came the lampreys, and from them the sharks and other fishes. Fishes, you see, swam in the ocean for ages before any land animals existed. From them were developed the great salamanders of the later coal-forming period, which were the forefathers of the gigantic reptiles that ran creation during the mesozoic epoch, after the mighty upheaval that lifted the Allegheny Mountains out of the water. That was the age of reptiles. Some of them walked on the land, while others swam in the sea, and others still flew in the air. There were land species of which individuals were seventy feet in length, and they and others of herbivorous habits were preyed upon by carnivorous reptiles nearly as big—formidable lizard-like beasts with huge teeth and tremendous jumping powers. The first mammals that existed in the world were derived by descent from these giant reptiles, some of which, closely connected by family relationship with the line that produced man, had enormous fins on their backs, or tall spines like masts, bearing yard-arms like those of a man-of-war, though for what purpose is unknown. These earliest mammals were nearly related to the Australian hedgehog and to that extraordinary beast, the duck-billed platypus, which, though a mammal, resembles both reptile and bird and actually lays eggs. From them came the marsupials of the opossum type, which produced in the course of time the creodonts—eaters of flesh and insects—that were in form somewhere between opossums and dogs. They have all disappeared, though some rather remote relatives of theirs are found at this day in Africa and Madagascar, adorned with long scientific names. The creodonts evolved the raccoon-like lemurs, one genus of which had teeth like those of great apes and men. In fact, one species of this lemur genus, though no larger than a squirrel, had a brain bigger, relatively to its size, than that of any other animal. It, as science has demonstrated beyond the possibility of a doubt, was the ancestor of the anthropoid apes, which were in turn the ancestors of man. The most manlike of the anthropoid apes now surviving is the chimpanzee, but the actual progenitor of humankind was another species, at present extinct, which has not as yet been identified with certainty. Here there is a gap in the human genealogy, which science is partly able to close by going backward from the other end. Though the typical manlike ape is wanting, the remains of ape-like men—a whole race of them—have been found at Cannstadt, near Stuttgardt, at Neanderthal, near Wiesbaden, and at Liege, in Belgium. These people had skulls of inferior development, massive jaws, no chins worth mentioning, and probably walked with their legs bent. The long-sought missing link was between this ape-like man and the anthropoid ape. He will be found some day; science is entirely confident of that. The only reason why he has not been discovered already is that he is too modern. Such of his remains as have been preserved are at present under water. Some day, by the recession of the water, the beds containing them will be uncovered, and they will be dug out. That is the way all animal remains are secured. The animals which find a burial on land inevitably disappear, their bones crumbling and turning to dust. But those which find a watery grave by being swept into the lakes or carried away by the rivers are apt to be covered over with the mud of the bottoms and so kept intact as to their skeletons for ages. Of the creatures which represented the missing link many must have perished in floods, been drowned by falling into the water, or have died, their bodies being subsequently floated away. In a time that is sure to come centuries hence their jawbones and other parts will turn up and the genealogy of man will be rendered complete. In this manner it has been ascertained how by evolution the creature man, as he is to-day, was produced. The question now is, What is he progressing toward, and what will become of him? If his past is interesting, surely his future ought to be an hundred-fold more so. Already it is manifest that, physically speaking, man has been going backward for some time past. His bodily faculties have been steadily diminishing in quality and power. Living under conditions essentially artificial, his senses have lost their original acuteness. The keen scent he used to possess has become so far rudimentary that scarce anything is left of it. His sight has grown so poor that it is the very exceptional individual who possesses what is called "normal" vision, and a large percentage of young people require spectacles. Good hearing is so commonly lacking in civilized human beings that one meets deaf people in every drawing-room, and deaf and dumb unfortunates are being propagated to such an extent by marriage as to give promise of creating a silent race apart from mankind at large. The average health and physical condition of man and woman are less good than hitherto. Just as lenses have been adopted for improving the eyesight, and fans constructed for holding between the teeth to hear with, so electro-magnetic apparatus may be devised to supply lost delicacy to the sense of touch, and various other artifices may be employed to lend acuteness to dulled perceptions of all sorts. Whether this comes about or not, it is reasonably sure that the man of the future will be developed rather in the direction of mind than of matter. Gathering the forces of nature more and more under his control he will have less need of bodily strength. Eventually he ought to evolve himself into a being of pure intellect, incommoded slightly, if at all, by a fleshly environment. In short, as Dr. Elliott Coues puts it, he may become eventually a highly organized ghost, with privileges of unrestricted locomotion through space—resembling, in short, one of those apostles of contemporary Boston Buddhism, who are able to project their spiritual entities to the utmost confines of the infinite, and view with incorporeal eye the awful mechanism of the universe.—*Washington Star.*



HEAT WASTED.—The most recent observations as to the amount of heat the earth receives from the sun show that in clear, pleasant weather 63½ per cent. of heat is absorbed by the atmosphere and only 36½ per cent. reaches the soil. This figure rises in October to 41 per cent. and sinks to 28 per cent. in January.

CRYSTALLINE GLASS.

DETAILS OF AN INTERESTING MANUFACTURE.

Few trade secrets have been kept so well from the knowledge of the general public as the process of producing the above-mentioned species of decorative glass. It is said to be the invention of a French engineer, who called it "vierre gievre," or frozen glass. In the United States, where its manufacture has been brought to a much greater state of perfection than in any other country, it is known under the more common names of chipped or crystalline glass, and the operation of manufacture "glass chipping." It has a remarkable appearance, being covered with fern-like figures, no two of which exactly resemble each other, differing in both shape and form. To those unacquainted with the method of producing this glass—and there are very few that have any conception of how it is made—the process of manufacturing is very puzzling. This method of ornamenting glass is so simple that most people, when they have it first explained to them, will hardly believe that such simple means can produce such marvellous results. It is done by covering glass with glue, which adheres to the glass, and when the glue dries it shrinks and draws with it pieces of the glass or chips of glass. The first necessity in carrying out this process is to have the glass which is to be ornamented ground either by means of the sand blast or by the more troublesome means of grinding by hand. This is done by rubbing a stone with a flat side over the glass till it has lost its polish and becomes translucent. A thin layer of emery kept wet with water will facilitate the grinding, which should be as coarse as possible, and for which reason grinding done by the sand blast is preferable. After the glass has been ground it should be kept scrupulously clean. Great care should be exercised that the surface is not touched by the hands. Any trace of grease is very apt to make the results uncertain. If the glass has, however, become contaminated, it may be cleaned with very strong ammonia, although glass which it has been necessary to clean is apt to be rather unreliable. When everything is ready the glass it placed in a room where it is intended to carry on the process, accurately levelled, and flowed with a solution made as follows: Good glue is placed in sufficient water to cover it and allowed to soak for twenty-four hours. If the water is absorbed during the soaking, more may be added. It is then liquefied over a water bath and is then ready to use. In practice it makes considerable difference which kind of glue is used. By repeated experiments it has been found that Irish glue is the best for the purpose. A wide brush is dipped in the glue and applied to the glass. The coating should be a thick one, otherwise it will not be strong enough to do the work required. When the plates are coated they may be placed in racks, and the temperature of the room raised to 95 or 100 degrees F. They are permitted to remain at this temperature till they are perfectly dry, which will be in from ten to twenty hours. It is at this stage that the uncertain character of glue shows itself. Under certain circumstances the glue will begin to crack and rise of itself without any more manipulations, but most generally it will require to have a stream of cold air suddenly strike it. If the plate is perfectly dry at this period, and of sufficient thickness, the top surface of the glass will be torn off with a noise resembling the crack of a toy pistol. Sometimes the pieces of glue will leap two or three inches into the air, and may even fly into the eyes and injure them. To guard against this it is customary for the workmen to wear a pair of spectacles fitted with plain glass. The glue will come off sometimes at the least expected times, notably if the plate with dried glue is being carried from one room to another. Plates which have shown a decided disinclination to chip have manifested a remarkable and unexpected activity, and have jumped into the face of the person carrying them in such a manner as to cause him to drop them. The

strength of the glue is something very extraordinary. If the glass has been coated on the hollow or belly side of the glass, the slight leverage thus obtained is almost sure to break it, especially if the glass be single strength. Even plate glass is not unfrequently broken. It might be a rather interesting mathematical calculation to find out the force necessary to separate the surface of glass in this manner on a piece say 48 by 48 inches. The result of the operation described may be various. It may be either a design resembling ferns of various shapes and sizes, or it may be a circular design, exhibiting narrow, feathery appearences; or, if unsuitable glue has been used, it may be of a nondescript appearance. If, after the glue has been applied, but before it has become any more than set, a piece of stout paper is pressed over it, and it is allowed to dry in this way, the glass will have less the appearance of feathers, but will be much coarser and larger pieces will be removed. The circular design mentioned occurs under the same circumstances as the other, with the exception that it generally is made during cold weather. Sometimes several weeks may run along and nothing but this formation be made. Some very elegant designs may be produced by submitting the glass once more to the same operation, covering it as before and allowing the glue to chip. This is known by the name of double chip. If the glass was covered with the small circles in the first place, the second time it will have an appearance very much resembling shells, and for this reason, this has been called shell chip. If, instead of using ordinary glass, colored glass is employed, pretty and original effects may be obtained. The glass may be either colored clear through or it may have only a thin coating on one side. In the latter case in some places the entire layer of colored glass will be removed, and in other places only a very little, and will therefore give all the gradations between those two extremes. Glass which has been treated in this way may be silvered and gilded and thereby be made still more remarkable in appearance. Extremely elegant effects may be obtained by what is known as "chipping to a line." The design is ground in the glass by the ordinary sand blast process. After the glass has passed through the machine, the protective coating (wax is generally used) is not removed, but is left on to keep the glue off those parts which are not intended to chip. The glue is then applied in a thick layer to the ground portion and the process is carried on as usual.—*Scientific American.*

Send it back Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.* 197 JAMES PYLE, New York.

BUSINESS NOTES.

BUSY PACKERS.

This is the busy season with Gordon & Dilworth. Up early in the morning to get the pick of the choice fruits; everything rushing about the factory; teams hauling in fruit; sorters picking it over and washing the berries, cooking, canning, labelling, boxing and shipping. Every one around the office equally busy; open till late in the night. It is a sight that not only gladdens a business man's heart, but every housewife would be delighted to see the wonderful care and cleanliness of hands and vessels. In fact, this factory is a model one, and accounts in a measure for the great success of the Gordon & Dilworth brand.

ANTIDOTE FOR THE GRIP.

W. R. Warner & Co. are evidently determined to keep in the van of therapeutic remedies. "Antalgic Saline" appeals to us to-day for recognition as a remedy for the relief of "headache," also for influenza and neuralgia, and as an antidote of "la grippe" they issue the "Pil. Chalybeate Compound:"

Composition carb. protoxide of iron, grs., 2½.
Ext. nuc. vom., - - - gr., ⅛.

Sig.: One pill every four hours and increase to two pills three times a day. Antalgic Saline, one dessertspoonful every four or five hours till relieved for headache. The same mode of administration precedes that of the chalybeate pills for "la grippe."

HORSFORD'S ACID PHOSPHATE.

The best tonic known; furnishing sustenance to both brain and body. Dr. O. Worthy, Lancaster, N. H., says: "I have used it in requiring brain and nerve food as a result of overwork attended with exhaustion and loss of strength, with impaired digestion, with good results.

HIGH PLACES.—The highest place in the world regularly inhabited is stated to be the Buddhist monastery Halne, in Thibet, which is about 16,000 feet above sea level. The next highest is Galera, a railway station in Peru, which is located at a height of 15,635 feet. Near it, at the same level, a railway tunnel 3,847 feet in length is being driven through the mountains. The elevation of the city of Potosi, in Bolivia, is 13,330 feet; Cuzco, Peru, 11,380 feet; La Paz, Bolivia, 10,883 feet; and Leadville, Colo., 10,200 feet.

SICKNESS AND STARVATION.—There is a popular notion to the effect that a person is more likely to take a contagious disease when the stomach is empty. Although this fact seems to be well established by experience, nevertheless it has never been established as a scientific fact until recently. Experiments which have lately been made upon pigeons, by two Italian physicians, demonstrate beyond any reasonable doubt that hunger is favorable to the activity of the infectious element, whatever it may be. Pigeons that had been starved were found to be very susceptible to the contagion of anthrax, although, when well fed, they were not at all subject to this disease. It thus appears that hunger in some way lessens the ability of the body to defend itself from the attack of disease germs. Possibly this may be in part due to the fact that when a person is hungry there is no gastric juice in the stomach, so that the protecting influence of this digestive fluid is lost. Then, too, the lowering of the vital powers as the result of hunger, lessens the resistance of the cells of the body in general.

The N. Y. Hay Exchange is located at 601 W. 33d St., corner 11th Avenue.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER- Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, April 6, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

NEW YORK.

THE CENTURY DICTIONARY comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to
THE CENTURY CO., 33 East 17th St, New York.

Be progressive and keep abreast of the times. Avoid dyspepsia by using **Lard Compound** and **Cottolene,** a substitute for lard.

The highest medical authorities pronounce them healthful; and expert cooks commend them.

Our **Clairette** brand of cotton oil soap is the purest and best laundry soap in the market; as pleasant to the hands as genuine castile.

N. K. FAIRBANK & CO.,
CHICAGO AND ST. LOUIS.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

AMERICAN ANALYST

A Popular Weekly Analysis, for the Family and Consumer, of Everything Relating to Man's Physical Need and Comfort.

Office, 19 Park Place.

[Entered at the Post Office at New York, as Second-class Matter.]

VOL. VII.—No. 16. NEW YORK, THURSDAY, APRIL 16, 1891. WHOLE No. 216

APR 20 1891 ILLINOIS

AMERICAN ANALYST.

PUBLISHED EVERY THURSDAY.

Subscription, - - - - - $1 per year.

THAT "FOOD AND HEALTH" CIRCUS.

The AMERICAN ANALYST is not the only journal making the discussion of food products a specialty that has felt constrained to denounce the false pretentions under which the recent Retail Grocers' Fair in this city was conducted. The management, intent solely upon capturing the unwary shekel, made a great demonstration beforehand in announcing the affair as a Pure Food Exhibition. But after the aforesaid shekel had been captured the visitor was forced to content himself with viewing a combined imitation of the side-shows of a country circus, and the cereal department of an American Institute Fair, lacking, however, several of the most creditable genuine exhibits that contribute to impress the latter upon the good will of the public. Our enterprising contemporary, the *National Standard*, says of the pure food humbug-feature of the exhibition that, "the managers of this class of shows make the Food Question serve their purpose—which seems to be their first consideration—of making money. It is not dealing fairly with the manufacturers of food products, most of whom were solely influenced to take part in the exposition upon the reasonable supposition that it was to be a "Food and Health" Exposition, and not a "Retail Grocers' Fair." Not only the manufacturer has cause for complaint, nor is he the only sufferer—it is the general public, that vast army of consumers, who are imposed upon in this matter. This great question of purity and wholesomeness of food affects every class of people. There is but the one food movement—but the one principle—and that is pure and wholesome food for the benefit of the human race. This is the first and only consideration; no money-making scheme should be tacked on to it in the interest of a few. A Food and Health Exposition can never be a real and lasting success when such an affair is made subservient to a building fund. Much as an association hall or exchange for the retail grocers of New York City is to be desired—and certainly every well-meaning person wishes these gentlemen well in their commendable enterprise—the grocers had by far better bide their time, or better still, inaugurate a series of Retail Grocers' Expositions, to be devoted to anything and everything pertaining to the grocer and his calling. Rather this than strike such a heavy blow to the food cause by this commingling of food with glass blowers, horse blankets, lightning eradicators and "drop a nickel in the slot and have your picture taken" machines, etc. Such things as these have nothing whatever to do with the stomach, nor any bearing whatever upon the health of the people. On the contrary, instead of forming part of the exhibits of an exposition devoted to food, they are a positive injury to the success of the food movement. If this thing continues the next thing in order at a "Food and Health" Exposition will be a shooting gallery, roulette table, balloon ascension, and last, but not least, a pie-eating contest."

STORM EXTRACTORS.

The notion that rain can be compelled to fall wherever desired by artificial agitation of the clouds has possessed men's minds—or, rather, some men's—for a number of years. A civil engineer in Illinois, named Powers, has recently published a book on the subject in which he maintains the soundness of the theory with much plausible argument and extensive citation of practical illustration, covering every country in which gunpowder is used in warfare. The author's argument is curious and cannot fail to impress the careful reader with the belief that the idea is at least within the limits of possibility. At all events, the Government has determined to give it a trial. The papers inform us that Professor Carl Myers, of Frankfort, N. Y., has recently returned from Washington, D. C., where he was called to consult with officials regarding the carrying out of an extensive scheme for promoting rainfalls in arid regions or during seasons of prolonged drought, by producing concussions in upper atmospheres, for which Congress has made appropriations. Prof. Meyers will begin operations with one hundred balloons of various sizes. The charges of mixed gases will be exploded at various heights through the medium of galvanic batteries and electric cables which will serve both to retain captive balloons and conduct the electric spark to explosive compounds. The necessary work will be done on his balloon farm at Frankfort, where the oxygen and hydrogen will be generated. Experiments will be made at Frankfort and near Washington; finally the sky-stormers will be taken to the arid regions of Texas, Colorado and other States. Theory and statistics favor the successful issue of the experiments.

VOLT AND AMPERE.

A simple explanation of two of the most common terms used in relation to electric currents was given recently by Mr. Edison in the course of a legal examination. Being asked by a lawyer to explain what is meant by the number of volts in an electric current, he replied: "I will have to use the analogy of a waterfall to explain. Say we have a current of water and a turbine wheel. If I have a turbine wheel and allow a thousand gallons per second to fall from a height of one foot on the turbine, I get a certain power, we will say one horse-power. Now the one foot of fall will represent one volt of pressure in electricity, and the thousand gallons will represent the ampere or the amount of current. We will call that one ampere. Thus we have a thousand gallons of water, or one ampere, falling one foot, or one volt, or under one volt of pressure, and the water working the turbine gives one horse-power. If, now, we go a thousand feet high, and take one gallon of water and let it fall on the turbine wheel, we will get the same power as we had before, namely, one horse-power. We have got a thousand times less current or less water, and we will have a thousandth of an ampere in place of one ampere, and we will have a thousand volts in place of one volt, and we will have a fall of water a thousand feet as against one foot. Now the fall of water or the height from which it falls is the pressure or volts in electricity, and the amount of water is the ampere. It will be seen that a thousand gallons a minute falling on a man from a height of only one foot would be no danger to the man, and that if we took one gallon and took it up a thousand feet and let it fall down it would crush him. So it is not the quantity or current of water that does the damage, but it is the velocity or the pressure that produces the effect."

SILICATE MOUNTAIN.—A mineral discovery of unusual value is reported from Kamouraska, in Lower Canada. A Quebec correspondent states that an entire mountain has been found composed of silicates, otherwise known as vitrifiable stone, of a purity certified by the provincial engineer to average 98 per cent. This material is used for the manufacture of the finest glass, and is believed to exist nowhere else on the American continent in such purity.

SUPERSTITIONS.

PREMONITIONS, COINCIDENCES AND MENTAL PHENOMENA.

Nobody can fully explain the states of his own inner consciousness, or tell the reasons why, when in apparent good health, the atmosphere is luminous with transcendental glory, and anon is shadowed by dimly comprehended specters. Many individuals have strangely recurrent coincidences or presentiments, which, considered abstractly, are—whether forewarnings of good or of evil—so frequently fulfilled that it is difficult to assume them to be casulties only. Science, however, is dumb in explaining the *rationale* of such phenomena. There are times and seasons when the entire firmament is rose colored, and then, without any apparent reason, the heavens are overcast, and we each learn this lesson anew, that the cause of our sorrows, discomforts, and misfortunes lies deep in the nature of things. Perhaps this is one reason why we pay attention to mystical forecasts, and there seems to spring into existence "the prophetic soul of the wide world dreaming on things to come." It is customary to say it is lucky to do a certain act at a certain time; it is unlucky to do certain things, or to leave undone this, that, or the other thing. If logically traced to the source from which such observation sprang, it is found all such superstitions are based on the law of coincidences. Take an individual in a slightly morbid or reflective state, and the dark side of human affairs thrusts itself upon his notice—the tyranny of the strong towards the weak, the cruelty abounding in nature, the transitoriness of all human affairs; and let a number of coincidences occur bearing upon some one of these subjects of thought, and a superstition is founded, which may be transmitted and become perpetuated from generation to generation. Many persons reject and ridicule the common superstitions found to exist quite as much among the intelligent as in the every-day life of the common people. The individual who sits at the table, making the company thirteen, will laugh and jest at the timorous anxiety of his hostess, who had—previous to his unexpected arrival—been to considerable trouble to avoid such a casulty, but will feel uncanny if he spill the contents of the salt jar accidently, and will hasten to burn some immediately, to ward off any evil effects which might otherwise occur in his business relations; or he will pass some anxious moments if he observes the new moon over his left shoulder, instead of his right, nor will he undertake anything important on Friday. Many persons who pride themselves on being proof against the folly of superstition yet feel uneasy if they do not observe the rules governing this bit of unreason in other people. Scientific scholars who have reasoned from effect to cause, who have accepted the fact that matter and force are indestructible—such minds may be observed to be influenced by the good will of Pussy, she having since the days of the Egyptians traditionally brought good luck to the house of her choosing; while the breaking of a mirror is supposed to bring misfortune seven years long to the unlucky possessor. The negro and Indian races are very superstitious; their comings and goings, their up-risings and down-sittings, are governed by a series of invisible laws that would render life one long nightmare to a sensitive and trained intellectual race. Among the negroes, after death the soul of the dead is supposed to be hovering around, and many devices are resorted to to appease the ghost, and to appease the ill will that may have been awakened by lack of reverence to the living and unseen portion of the departed in the handling of the dead. Still, if any person has a blemish—is lame, sick, bruised, or sore—he will not touch the dead, as his ailment is thereby rendered incurable; indeed, any one who assists in caring for the body of a deceased person will be sure to carry away something belonging to the deceased, to insure him against visits from the "duppy," or ghost. The flight of certain birds over the house and back again indicates a sudden death in the family. The beautiful turtle dove, from the plaintiveness of its note, is looked upon as a token of evil omen, foretelling serious misfortune or death if it lights upon the house. No "duppy" ever visits the living with good intent, but always to work harm. There are certain plants and trees given exclusively to be the habitation of the ghosts, and no negro will pass or handle one of the bewitched specimens of vegetation. The practice of dancing about the corpse is out of fear of vengeance to be now paid to any person from the ghost, as no one can make the circle who did harm (*i. e.*, administered poison) to the deceased, as he would, if guilty, surely fall into convulsions and die miserably. Occult methods of obtaining poison from plants and deadly snakes obtain, and may be administered so as to defy discovery; hence this disgusting practice of the dance of the death circle. Remedies are prescribed of so simple a nature that if no good is done, no harm can follow. Tying knots in a bit of woolen yarn, a knot for each wart, walking backward, muttering "de spiruts done settle down," with the knotted string held in the hand till near the fire, then rubbing the knots until slowly consumed, will cure the warts. A similar formula over a bit of wet paper plastered on the chest will cure hiccoughs. The hand of a dead person slowly rubbed over sore eyes, with the same formula, only "de spiruts done walk over" added, is a sure cure. Nails can be conjured from the joints of rheumatic patients by repeating a charm, and whooping cough cured by placing the child under a charm. The faculty for seeing "duppies" is given to those persons who at birth had a caul over the face. This membrane is treasured by the family with much care, as the possession brings good fortune and the power to fortell coming events. The Indians are quite as superstitious as the negroes, but they are a much more reserved and unsocial race, so it is much more difficult to ascertain the legends and explanations for their curious rites. An Indian will turn from his course and vary to the right or to the left without any explainable reason, apparently; he has come to a marching column of migrating ants, and has turned to one side to avoid crossing the route traveled by them. The worst of disasters would be drawn down on the unlucky mortal who failed to observe this rule. Birds are credited with having supernatural powers. The rain-crake, with its unearthly and melancholy cry, is a very prophet of evil. They are popularly thought to be the spirits of the departed come back to mourn and avenge injuries done to them in life. Eating together constitutes a sort of kinship, and he who breaks the bond will be detected by the ticking of a certain beetle. The neighing of a horse when you meet a stranger betokens trouble. To have a crow cross your path, flying over head, is a sure forerunner of sickness and death. Most of these superstitions can be read by the law of coincidences. Thirteen persons at table coincides with the unlucky number at the memorable supper in which Judas betrayed the sinless one and went to his own death. Spilling salt is coincident with the evils that accrued to the salt-tax gatherers during the French revolution. The strangest part of these coincidences—which, if observed until sufficient data are collected, may be termed analogies—is that there seems to be a certain unexplained law of the mind in its groping that often leads to new facts and discoveries. In his *Budget of Paradoxes*, De Morgan relates the following story or theory: "The late Baron Zach received a letter from Pons, a successful finder of comets, complaining that for a certain period he had found no comets, though he had searched diligently. Zach, a man of much sly humor, told him that no spots had been seen on the sun for the same length of time—which was true—and assured him that when the spots came back, the comets would come with them. Some time after, he got a letter from Pons, who informed him with great satisfaction that he was quite right; that very large spots had appeared on the sun, and that he had found a comet soon after." To make the story complete there should now be found a connection between the comets and the sun's spots. The curious thing is that just this paradox was maintained before the Royal Astronomical Society by Professor Ashe before De Morgan's book came out. I have known one who has the capacity for invention to make statements about the necessary mechanical appliances needed to produce certain ends, that sounded widely improbable; and yet the most improbable are now facts. The quadruplex system for use in telegraphy was dreamed of when to relate the dream was a tale of wild improbability. This has occurred many times, and allows a perfectly natural interpretation—as some other mind traversed the same road and solved his dream into practicability by creating the necessary steel and iron image to express an embodiment of his thought. Again, there have been well attested instances in which mind acts on mind independently of distances. It would be hard to prove that when we think—and that in spite of a determination to think of other things—of some absent person that he is thinking of us. But if in a number of instances a number of persons were to record such experiences and compare results, the law of coincidence would have great weight in determining the truth or fallacy of such a law. In trying to grasp an abstruse subject like the relation between mind and matter, there must, from the nature of the working medium, ever be many opportunities for fallacious reasoning—as it is impossible to speak of mind as affiliated with the body, with a brain and the nerve currents, without localizing the mind, and proving its habitat and absolute identity. Mental and bodily states are never identical, but contrasted. There is no means of effecting a compromise between them, and in trying to express thought about mind it is not easy to say anything without localizing it. There is the old difficulty to be met: Is mind found in every organ, or all in the whole? Leaving all this, however, and allowing the statement that mind is, indeed, as a phenomenon different from physical forces, but correlates more or less directly in strict proportion with these, mind must be admitted into the circle of correlated force. Of course, it is quite impossible to reduce the quantity or quality of mind force to any method of mathematical precision. Vitality, energy, mental qualifications, health, courage, love, irascibility, may have a standard in our own mind with regard to an individual, but we cannot reduce such qualities with mathematical precision, and cannot communicate to others with exactness our own idea. When taking into consideration the physical facts underlying the mental facts, it may show that widespread concomitant action of the nerve currents and the agitation of the brain that may account for many of the unexplained incidents, divinations, witchcrafts, and similar phenomena as a result of that tumultuous conflict, and exercise of energy in reconciling the union of the material to the immaterial, even among the inferior races of mankind.
—*M. J. Gorton, in Popular Science News.*

ART IN NATURE.

KATE FIELD DISCUSSES NATURE AS A SCULPTOR.

What looked like the fossil foot of a child, with a little stocking on, was sent in to the National Museum the other day. The most curious thing about it was that the stocking itself showed distinct signs of wear on the heel and ball of the foot. It was with regret, however, that the object was pronounced not a fossil nor a child's foot, nor yet anything else save a concretion of silicious matter which had taken this strange form by pure accident. The imitation was so astonishingly exact that the mistake was not at all surprising. This is only one of many curiously imitative concretions which have been offered at various times at the Smithsonian Institution by persons who imagined them to be fossils. That it may be understood how they are formed, it

should be explained that matter in general has a tendency to segregate particles of the same kind gathering together. In the Connecticut River, for example, fine clayey particles are held in suspension by the water and swept along with the stream. Perchance some of them will collect about a pebble, a grain of sand, or any other hard object, subsequently gathering more about them untill a lump of some size is formed, with the pebble or what not for a nucleus. Such lumps often take very queer shapes, and it is amazing how they sometimes imitate the familiar forms in nature. A favorite shape with them is one which so closely resembles that of a turtle that a specimen of the sort is, as a rule, mistaken for a fossil tortoise. Looking at it from beneath, the head, the four legs, and the tail are quite distinct, with the lines of the shell; and yet it is only an accidental concretion of clay. Spindles, rings, and Indian arrow-heads are other shapes which such concretions take very perfectly. But clay is not the only form of matter which takes concretionary forms; there is a mixture of carbonate of iron and clay, which assumes very interesting shapes in the same way. One of these, very common indeed, is easily mistaken for a fossil peanut. Break one of these peanuts open, and you will invariably find a small spiral winkle-shell, which was the nucleus. Even more interesting are the bigger concretions of this "clay-ironstone," as it is called, which, having got into dry places are dried by the sun. By this process such a lump is made to shrink, the water being withdrawn from it, and to crack towards the centre. Afterwards, maybe, through the rising of a stream after a drought, the lump becomes submerged again, and its cracks and fissures are filled in with carbonate of lime, which all streams carry. Now, take such a lump, saw it in two, and you find that the sawed surfaces are like the most exquisite marble, the original material being interspersed with streaks of the carbonate of lime crystallized. In one locality in England these clay-ironstone concretions are found of very great size, and are used, when cut into slabs and polished, for the tops of tables and stands. There is a final transformation which the clay-ironstone concretion occasionally goes through, that produces the most extraordinary result of all. It may happen that the carbonate of lime which has entered into the mass is subsequently dissolved out of it, leaving a chambered structure with walls and nothing else. People who find one such as this, very naturally imagine that it is the shell or skeleton of some remarkable dead animal, and take pains usually to send it to the nearest museum. Some time ago a physician sent to the National Museum a clay concretion, which he supposed was the fossil arm of a man. Another person contributed an extraordinary stone of great hardness, which, when sawed through was found to be of much beauty, though in the process it smelt very badly. When Curator Merrill saw the inside of it, and observed its formation in eccentric layers about a small hard object as a nucleus, he knew that it was a calculus from the bladder of a hog or some such animal. By a curious inverse method of concretion all agates are formed. When certain rocks, ages ago, were in a molten state, great bubbles came in them and remained, in the shape of cavities, when the period of cooling arrived. Into these cavities water, which percolates through all rocks, flowed, and deposited carbonate of lime. [Qy.—Silicic acid?—Ed.] upon the walls in layer after layer until the holes were filled up. Thus, when the rock is cut through, the lumps of agate are found. There is a queer sort of rock exhibited at the National Museum called "flexible sandstone," because it bends very easily. You take a long strip of it by one end in your hand, hold it perpendicularly, and it will bend so that it is hard to realize that it is not going to break into pieces. The reason for this is that the rock was once what is called a feldspathic quartzite; but water, percolating through it, dissolved out the alkaline substance, leaving the clayey matter. Thus the grains composing the stones are no longer held firmly together; it is loose-jointed, as one might say. It is found only on the surface of sandstone deposits, and is of no use in building. In Brazil this sort of rock is the matrix in which diamonds are found. Speaking of diamonds reminds me that the students of the subject have found in South Africa for the first time a substantial clue to the processes by which precious stones were formed. Every one knows that the diamond is pure carbon; but, albeit carbon is cheap enough, it has been found impossible to crystallize it profitably by artifice, though Professors Maskelyne and Cook have produced very minute diamonds in the laboratory. Nature performs her chemical operations on a large scale, and, of course, with superior facilities. The rocks at the South African mines are shales of a highly carbonaceous nature, and up through them has been forced in times past a great mass of eruptive rock in a molten condition, so as to engulf the shale. For a long time the mass remained slowly cooling, and incidentally to the process the carbon in the shale was crystallized out in the form of diamonds. Afterwards the rock decomposed and rotted away—for rock will rot like anything else—forming the blue clay from which the diamonds are dug to-day.

ELECTRICAL HEATING.

A HINT FOR THE PROTECTION OF RAILWAY TRAVELLERS.

Now and again one hears of electric heating in a vague kind of way that would hardly lead anybody to suppose practical results had been obtained. But the fact is that the electrical heating apparatus is already in quite general use and that several companies have been formed for its introduction. One of the earlier forms of electric heaters, which was especially designed for street-car use, is not unlike an ordinary radiator, and has also been given a shape resembling that of the familiar metal foot-warmer. The rapid increase in the number of electric street-cars in our northern latitude has given a stimulus to ingenuity in this field, and a new heater has been brought out, which, for simplicity and economy of space, seems hard to excel. It consists of a narrow strip or ribbon of asbestos, inclosed in sheet iron, about three inches in width and one-quarter inch in thickness. This strip is placed under the car seats, extending from one end of the car to the other, and is protected by a wire screen. A second strip of the same dimensions is attached to the first as a kind of compressing plate, and the wires are imbedded in the asbestos. These strips are given a zig-zag form, so as to increase the length of radiating surface exposed in a given area. The current being turned on, the wires, by means of the resistance they are purposely made to offer to the current, become very hot, and this heat is radiated, therefore, steadily and equably throughout the car. A more agreeable means of heating it would be hard to imagine. No space is taken up by the stove, nor are any of the seats rendered unpleasant by proximity to the heating apparatus. One part of a car is just as warm as the other, and by means of various methods of arranging the strips the degree of heat can be regulated to a nicety. There is no need to get the car ready for the approach of winter nor to make any special arrangement whatever, other than the simple attachment of the strips under the seats. All that is necessary when heat is wanted is that either the driver of the electric car or the conductor shall switch or turn on the current through the heating apparatus, and thus the same agency which propels the car and lights it also provides it with warmth. The question which comes into one's mind on riding in one of the many electric cars now equipped in this excellent manner is why something of the same kind cannot be rendered available for office or household use. The probability is that it soon will be. In speaking of electric car heating at a recent street railway meeting at Columbus, O., one of the members stated that he had a little heater in his house which the laundress at any time connected up with one of the incandescent lamp sockets, and by means of which she ironed all day, the iron getting only so hot and never any hotter. Cooking is very often done in this way also now, and with the general extension of lighting circuits we may look for an enormous number of inventions in apparatus for using electric heat in the family. The change will go even further than this, for if heat can be brought into an office or a house through the agency of a small wire, there is certainly no need to convert the cellar of every house into a miniature coal mine, with all the attendant nuisance of running a furnace or open fires and then getting rid of the ashes. It is quite within the bounds of possibility that at no distant day our heat will be gently radiated for us from the wall paper, and light supplied to us from a luminescent ceiling, and all by the simple pushing of a small button in some obscure corner of the room.—*Amateur Electrician.*

An Old Timer.—A man in Germany has constructed a clock which will run 8,000 years. The maker has warranted it to run without stopping and without winding until midnight of the year 9999.

Cultured Liberalty.—Bernhard't nine performances in Boston aggregated $43,889,37, the largest amount ever drawn in that city by any actress or singer in the same number of appearances.

Mutal Marriage Society.—The girls attending college at Columbia, Mo., have organized a sort of marriage mutual aid society that is working very satisfactorily. Every time one of the members has a gentleman escort to whom she is not engaged she pays twenty-five cents into the treasury. When a member becomes engaged she pays in five dollars. When a member gets married the club makes her a wedding present of $100.

Bonnets and Birds.—Olive Thorne Miller has posted, from her home in Brooklyn, 20,000 printed slips, asking the women of New York not to wear birds or their plumage. And the women of New York go on wearing birds and birds' wings until, according to dealers, the demand for this style of ornament is greater than ever before. The only consolation in it for Mrs. Miller is that she has done her duty.

Reckless Hypnotism.—The *British Medical Journal*, in commenting on a case of hypnotism described in a New York Medical paper, insists that England shall pass laws to prevent the reckless practice of hypnotism in Great Britain. The article expresses regret that reliable information is at hand that several physicians of standing are travelling in England under assumed names and practising hypnotism upon all applicants, regardless of risk to health and life.

Paper Pulleys,—One ingenious French machine-tool builder, M. Burot, of Angouleme, is turning out paper pulleys for power transmission, based on the principle of the paper car-wheel. The pulleys have metal hubs and arms, on which the soft paper is poured and then compressed. After drying, the paper pulley is treated in a bath of linseed oil and resin, to give it a greater resistance against the influence of moisture. The pulleys are said to be very light and of low price, and to have given excellent results in practice.

Rough on Microbes.—The occult but riotous bacilli which have played havoc with man since they first met have reached a crisis in their existence never known before. As Matthew Arnold would say, man is "onto them." They are being hunted and brought to light, and the medical searchers all join in the hunt for something to poison Koch's poison, for the bacillus of what is known as consumption is now said to be the first of an unprecedented group of new poisons that shall destroy some of the most important human diseases, such as diphtheria, lockjaw, and various fevers. The lion-headed Bilroth, the first man-cutter of Europe to-day, is reported to be on the verge of beginning the scientific elimination of cancer. Sir Morell Mackenzie was quoted yesterday as speaking hopefully of coming developments in medicine that will revolutionize its powers. Man awaits in the next few years an amount of physical regeneration and purification such as has not been equalled in all his previous existence. —*Sun.*

ANIMAL ECONOMY.

EVIDENCES OF GOVERNMENT SYSTEM AMONG LOWER ANIMALS.

Discussing the assertion of Grote that "positive morality, in some form or other, has existed in every society of which the world has had experience, Mr. J. W. Slater says, in the *Popular Science Monthly* for March: Whether the author just quoted knowingly or intentionally referred to the societies of the lower animals, as well as to those of mankind, I am not aware. Perhaps, if he had no such intentions, his testimony may be regarded as all the more valuable. Assuredly the ant-hill, the wasp's nest, the rookery, or even the roaming herd of elephants, antelopes, peccaries, or the like, could not cohere, and, therefore, could not continue to exist as such without some kind of law and government. Such law, too, must have its foundations laid, not exclusively in the physical force of the individual, but in part upon notions of right and wrong, however vague and crude. In a herd of bisons, of wild horses, of elephants, or in a troop of baboons, the strongest, generally a male in the prime of life, possesses and exerts a certain supremacy. He holds exactly the same position as does the chief of a savage human tribe; holds it by the same tenure and exercises it in a very similar manner, and subject to the same limitations. That his authority is not absolutely uncontrolled, we may learn from the fact that the male adults, who live in exile, are always the largest and most powerful. Among birds the moral life is more highly develcped than among mammalia, as we may learn from their being more monogamous. Hence, with them, individual superiority sinks very much in the background. The rookery or the heronry seems to form a republic where all are subject to a code of laws, which the majority is always ready to put in force against any offender. The queen bee holds her position by the right of the strongest as against all rivals, and, in the birth or the introduction of another female, she is always bound to do battle to the death for her position. But her sway over her subjects—if such we may consider them—unlike that of the strongest tusker in a herd of elephants, rests nowise upon physical force. Many facts prove that the lower animals recognize property, and distinguish as clearly as do many men between *meum* and *tuum*. When trespassing they plainly know that their quarrel is not just, and conscience ofttimes makes cowards of them. The garbage heaps of Rome are all appropriated by the dogs, each being the fee simple of some particular dog, who will not suffer his claim to be invaded. The homeless dogs of Constantinople have their particular quarters of the city, into which no dog, save the regularly established canine inmates, can intrude without the risk of being torn to pieces. A spider, unless greatly superior in size, hesitates to invade the web of another spider for marauding purposes. Ants consider themselves rightfully entitled, not merely to the city they have built, and the roads they have laid out, but to the whole neighboring territory, and they will brave any odds in its defence. We may go yet further. Not only do animals feel a right to such possessions as they have acquired by custom, by first discovery, or by labor. Such right among social species is recognized by public opinion, and is enforced by positive law. As an instance, it has been frequently observed in rookeries that a particular couple of rooks, too lazy to fetch building materials for themselves, and given to plunder their more industrious neighbors, have been formally punished by the community. "Crow courts," or "crow parliaments," as they are locally called, have been observed in various districts. These are prolonged meetings in which, after much noise, sometimes proceeding from one bird, sometimes from a small number, and then again from the general assembly, a single rook is attacked by the community and put to death. These executions do not seem to be connected with any inroad upon property, and we have reason to suspect that we have here proceedings for offences against the person, or the general well-being of rookdom. The laws of ants are probably more complete and intricate than those of the rookery. In the ant-hill the individnal is completely absorbed in and subjected to the interests of the community. Nationality among the lower animals shows itself in two very different types. Among vertebrates, the nation, wherever it exists, is composed, as in the human species, of a number of families, monogamous or polygamous, as the case may be. Among insects the social unit is not the family, but the individual. In the case of the hive bee, one might say that the family and the nation are coextensive. Among ants this is not the case, since in every well-established ant-hill there are several queens, so that the community is not linked together by blood. It may be contended that the absence of the family, viewed as a something which for most individuals has claims stronger than those of the state, is the cause which has permitted the successful organization of communism in insect societies. Among ants, bees, wasps, etc., the state has no rival; the great majority of the social species are neuters, incapable of domestic attachment, and devoted to the community alone. To attempt, without the existence of neuters, to introduce among mankind the social arrangements of the ant-hill, is a baseless scheme. Concerning the government of social insects we are as yet utterly in the dark. We see works undertaken, altered, and extended, criminals executed, guards set, food brought in, nuisances removed, expeditions planned, and wars waged, but we do not see the guiding spirit. If the various functions of a human community were left to the spontaneous initiative of all comers, we should have sad confusion.

BELLAMY'S VISION.

FAILURE OF THE NATIONALIST THEORIES WHEN PRACTICALLY ATTEMPTED.

Several experiments with nationalist theories are being tried on a modest scale in various parts of the country. One of the most interesting, which was not intended as a test of Bellamy's ideas, recently met with lamentable failure at Evanston, Ill. That was a co-operative food supply scheme, which failed through a combination of unfortunate circumstances, but which deserved success. It was undertaken by about forty families of the best people in the artistocratic suburb of Chicago, and the servant nuisance was the exasperating cause. The housewives of Evanston found it impossible to secure competent servants at fair or any wages. This seems to be the universal complaint of surburban wives, and no doubt the women in thousands of homes will sympathize heartily with their sisters of Evanston in their desperate search for a remedy. The evil in Evanston was a little worse, perhaps, than that which exists in the outlying districts of Eastern cities. The advance on city wages which the Evanston women were willing to pay was not sufficient to induce capable servants to live outside of Chicago. Such servants as were willing to go out to suburban service were pretty sure to have some serious defect in character or capacity. The most common fault was in temper, and it was a comparing of experiences with impudent "help" which led to the suggestion of a co-operative kitchen. Husbands were consulted, and the idea rapidly took shape. About forty families, numbering 200 persons, agreed to patronize the kitchen. Plenty of money was forthcoming. Quarters were established in the centre of the town, and the equipment of a well-appointed hotel kitchen was provided. The undertaking was to deliver well-cooked meals ready to go on the tables three times daily at the homes of the subscribers. To do this required three or four peculiarly fitted delivery wagons. Each family was served with food in what was termed a "kitchener." This was a tin affair of about a foot deep and two by three feet horizontally, divided into compartments, and each compartment surrounded by hot water. In addition, the wagons each carried a small stove to keep the food hot. This portion of the arrangement was the only one that was in the nature of an experiment, and it accomplished everything that was expected of it. Except that from five to fifteen minutes elapsed in getting the food from the kitchen to the dining-room, the plan was the same as that of a hotel with 200 guests or a big restaurant. Bills of fare were sent out each evening for the succeeding day, and the subscribers ordered their meals for the following day on blanks prepared for the purpose. If guests arrived unexpectedly, they could be provided for at fifteen minutes' notice to the steward. The only difficulty met with in delivering food satisfactorily was that it was found impracticable to serve eggs, for the hot water in the kitcheners was sure to add a little to the cooking process in transit and render them overdone when delivered. But soups, roasts, steaks, vegetables, puddings, &c., were delivered, so the subscribers said, in as palatable condition as though they had just come from their own kitchens. The failure was one of administration. The steward first employed was incompetent and extravagant. There was an interval of bad management before another was secured. The next man was a good one, but his health collapsed in two or three weeks, and then the subscribers got discouraged. They had other things to discourage them. The discharged servants made an awful fuss. Each family had retained at least one servant in its employ, most of them discharging their cooks only. Some of the girls who were retained in other capacities struck. A sort of servants' league was formed in the town, to boycott the subscribing families. Then the local tradesmen got jealous, and made trouble when the steward of the co-operative association bought supplies of the wholesale grocers in Chicago. The steward went to a large wholesale house in Chicago and ordered a big bill of goods. "For what hotel is this?" he was asked when the order had been taken. He replied that the supplies were for the Co-operative Housekeeping Association. "I'm sorry, but we can't take your order," was the answer. "If we sold goods to you we would be boycotted by every retail grocer in Evanston." So the Evanston people got disgusted and made up their minds to put up with the insolence of their individual cooks rather than worry any longer with the obstacles in the way of co-operative housekeeping. The experiment began in November and it ended ingloriously two months later in January last. Then the discharged servants got their revenge. They had prophesied the failure of the co-operative experiment from the start, and they had determined to boycott the forty families after the collapse as well as before. Sad times those forty housewives had in getting new cooks to preside in their kitchens. It took a good deal of money and infinite trouble to secure from various sources the culinary skill that was denied them in Evanston. And according to last accounts their troubles are not over yet. Another experiment more avowedly nationalistic is interesting people in San Francisco. It is a Bellamy boarding house and other forms of co-operation, with religious features added. It was established a few weeks ago by Arthur W. Dowe, who is at the head of a co-operative scheme which he entitles the "Commonwealth of Jesus." Of course the name has given the impression that the institution is a crank's scheme. The house was opened with fourteen inmates. Dowe says that they get board for $5 a week which elsewhere would cost $8 or $10. It is proposed to have three classes of members. Full active members are expected to turn all their property over to the society and to hold all property in common with the other members. Active independent members will retain their individual property, but will turn all the net profits into the society treasury and enjoy all the social features. Honorary members will be those persons who patronize the co-operative stores and restaurants which are to be established. Regarding the plan for co-operation

stores the secretary, W. Everett Stone, says: "We will sell checks for $1 and upward, punch out the amount of purchases at current retail prices, and at the end of six months or so, when we decide upon a dividend, holders of checks will get 75 per cent. of their share of the net profits of the store. We will soon start a co-operative restaurant on much the same plan. Meals will be given for about 25 cents. It is surprising how many interested inquirers come or write to us. We have not yet got started according to our full plans, and no active members has yet turned their property into the treasury."

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

KIDNEY SOUP.—Take enough kidneys to make two pounds, a carrot, a turnip, an onion, two potatoes, cayenne and salt. Put half the kidneys in four quarts of water and cook slowly until well done; take them out and chop very fine, return to the water with the rest of the kidney cut into small pieces; grate or chop very fine the vegetables, add them to the soup, cover closely and cook slowly for an hour and a half.

BEEF WITH CURRIED RICE.—Take two pounds of lean beef cut from the round in slices, not chunks, and stew it in a little water with a carrot, a stalk of celery, half a turnip, an onion and some parsley, all chopped very fine, until it is quite done; season with salt and pepper; the vegetables should be boiled to a pulp and the gravy thick and rich. Boil some rice in slightly salted water; when it is done and quite dry add to it a lump of butter and some curry powder. Put the beef on a platter with an edge of the rice, and serve very hot.

BROILED SHAD.—Select a fine roe shad and a dozen oysters; split the fish down the back and remove the spine, wash and dry it, cut slashes in it and lay it for an hour in a dressing made of two large spoonfuls of olive oil, a teaspoonful of lemon juice, salt and pepper. Take from the dressing and broil it nicely; cut the roe into pieces the size of an oyster; dip them and the oysters also in beaten egg and bread crumbs and fry them in boiling lard. Serve the shad with these around it garnished with parsley.

SHRIMP SALAD.—Cleanse a crisp head of lettuce and lay it in a salad bowl. Shell a pint of shrimps and pile them on the lettuce. Mince two hard boiled eggs fine and sprinkle them over the shrimps, with a large spoonful of capers; over all pour a mayonnaise dressing.

ORANGE FRITTERS.—Make a batter of half a cup rich milk or cream, one well-beaten egg, a teaspoonful of melted butter, a pinch of salt and two tablespoonfuls of flour, in which is sifted one-quarter teaspoonful of baking powder. Peel four or five large oranges, divide them into sections, remove the white skin, dip each piece first into sugar, then into the batter and fry a few at a time in boiling lard. Serve with powdered sugar.

COCOANUT CUSTARD.—Beat well, without separating, the whites and yolks four eggs, add to them a scant quart of milk, half a cup sugar, a teaspoonful of butter, a little grated nutmeg and half a cup of fresh grated cocoanut. Bake in a steady oven until the custard is set. Serve very cold.

SHIRRED EGGS WITH CHEESE.—For six people take one pint of cream, four ounces of Parmesan cheese, a little cayenne and six eggs. Put the cheese and two-thirds of the cream and the dash of cayenne together in a saucepan and cook them till they are thoroughly incorporated and quite smooth, then pour the mixture on a buttered dish and put over it the rest of the cream which has been warmed. Break the eggs into this, sprinkle with little more cheese and cook in a hot oven until the whites of the eggs are firm; it will take about four minutes. Serve at once.

WOMEN'S CLUBS.

JENNIE JUNE GIVES AN EXHAUSTIVE ANALYSIS OF THE SUBJECT.

A paper on "Women's Clubs" by Mrs. Croly of Sorosis, was read last week at the Woman's Club of Worcester, and their invited guests from other clubs of Massachusetts. Introduced by Mrs. Stone, president of the Worcester Club, Mrs. Croly began by saying it was much easier for her to "talk back" than to "talk forward," and so hoped the ladies would ask questions upon her paper that she might speak more fully upon the subjects that concerned them. Women's Clubs at first, so runs the paper, shared the fate of women, were declared non-existent. The original idea of clubs is a banding together of persons on equal ground and joint expense for any object they may choose. Oliver Goldsmith, one of the original "nine" of "The Club," had the word "literary" struck out as needless. Clubs should be based on unity, equality and fraternity. Women's clubs are broadening. While many men's clubs go no further than cigars, whist and wine, women's clubs are educational and instructive, giving a knowledge of methods, teaching to advise and weigh, to see the good and ignore the evil, to recognize the smallest things as of value, to see clearer, to hear more keenly, to perceive more accurately, and to show that no one has a right to throw contempt on anything in this universe. "Getting wisdom" is the inspiration of clubs. To mothers left behind, incapable of sharing the questions of their children, outside of the money-getting, and not keeping up with the affairs of the world, came an uprising, a protest against the condition of women, bringing out a spirit of fellowship among them. She then warned concerning some of the dangers incident to prosperity. What one has done, another desires to do. A hobby or collection of hobbies takes away freedom, and the club ceases. The club is a school, and to many the only school within reach. The paper was ended with questions sent to her by different clubs. Mrs. Croly was then asked about the rapid growth of some clubs, and responded by telling of the club at Dayton, Ohio, begun three years ago by home-making, home-loving women, who wished to keep up with the times, limiting their membership to twenty-five. A second meeting was called to enlarge their number to seventy-five. When formed as a club they all took hold of hands and—cried. Their seclusion was broken; neighbors who before were unknown now felt for the first time the strong bond of fellowship. They felt uplifted, as though they beheld a new heaven and a new earth. They have gone on in good work and now number two hundred and fifty. A Boston lady asked if insurance clubs for women had been formed, to which Mrs. Croly answered in the negative, though the question had been brought up in Sorosis ten years ago. There are but two insurance companies in New York who take policies on women, and only one justly. In London there are several—the Sisters' Friendly Society, Oxford Working Woman's Society, Scottish Woman's Benefit Society, etc. What have women's clubs to do with practical charity, when there are so many organizations for that purpose? The Philadelphia club and the Chicago society do a great deal of charitable work not possible for all clubs; but clubs may study practical methods of help, and find that to make the poor self-supporting is better than to give money. Do clubs have associate members? There are none in Sorosis, though some are known as remote members, who, though living in a distant city, have sometime been full members. Remote members have the rights of full members when in the city, though are not expected to pay dues. There are also honorary members, but associate members are doubtful help. The presiding officer asks the meaning of a "full" member. Answer—One who brings head, heart, hands and feet into the club, consecrated to work, who takes a side place until she is needed, who is not absent, nor loses her interest, who does not look on with indifference, but with alert intelligence, and considers the club a whole of which she is a part. How many members has Sorosis, and do all share the work? Answer—There are two hundred. No endeavor is made for each to work in an active sense, or would it be desirable. Quiet inspiration is needed from some. There are nine standing committees, on art, science, music, drama, literature, house and home, keeping in *rapport* with activities as they move along, keeping the progress of the world before the club. Much depends upon the genius of the chairman of these committees. What do you think of rotation of office, and what is the most harmonious means of appointing a nominating committee? I am against it, for it is a club danger. Keeping to a rut narrows, it is true, but it is not well to change every year or two. The president must have experience and some element of permanence. As transplanting too often retards the growth of the plant, so with offices. Make your term two years with possibility of re-election. The good of the club, not personal feeling should be considered. New blood is needed after a time. If the wrong woman be put in because a change must come, great harm can be done. Question if the club wish for her, not she for the office. The woman who tries for it is not the one needed. It is the business of the club to elect their president, not ask if she wishes the office. Should the president be chairman of the executive committee? No, a wide division should be made between the controlling of the whole club and the controlling of the business part. The president should be a woman of influence, not especially of power, and not to do energetic work; one to keep the machinery oiled, not to start the power or keep it running. All, though, are subject to the club itself. Should there be proscribed conditions of entrance to clubs that would be sure of full members? That depends upon the working influence of the club. People grow into members by cultivating themselves. All things, powers, can be cultivated. People antagonistic at first (don't try to get rid of them) can be assimilated. Cultivate sympathy for even that which you do not like. Learn sympathy. Part of us is in everything, part of everything in us. Sympathy translates; looks into other minds and sees something to copy. Recognize what is valuable in others. True growth toward heaven is to recognize the good in every other person and ignore or fraternize with what we do not like until we do.

MERELY A SPECTATOR.—"What office are you a candidate for?" inquired the reporter, who was making his hasty rounds of the polling places. "Me?" exclaimed the man leaning up against the door frame. "Thunder! I ain't running for anything. I was born in this country."

WOMAN'S WORLD.

WHAT IS DONE BY SOME OF THE WOMEN WE HEAR TALKED ABOUT.

The Princess of Wales is a first-rate photographer. A London woman has a class of 100 cooks, to whom she gives "entire dinner lessons." The bridal train of the daughter of Princess Victoria Louise, daughter of Princess Christian, is to be made at the Royal School of Art Needlework. Mrs. Leland Stanford gives $60,000 a year to charitable objects and keeps a number of women employed in making pretty home decorations for her Washington and California houses. The Queen of England firmly believes that objects made by blind people bring luck, and she has had the cradle for the young Princess of Battenberg entirely made by blind men and women. Miss Kingsley, daughter of Charles Kingsley, has been awarded the decoration of the French academic palms, with the grade of "Officer of the Academy," for her valuable writings upon French art. Drunkenness is said to be the besetting sin of London flower girls, and Mrs. Franklyn Taylor is establishing guilds in various parts of the city in which the flower girls may find shelter and keep their flowers. The Princess Louise of Schleswig-Holstein, who is soon to become a bride, is a tall and very handsome young woman. Her shoulders, arms and neck are perfectly proportioned, and she has pretty dark blue eyes. Mrs. Amelie Rives-Chanler is now at San Remo, where her health is sufficiently improved to allow her to disport in picturesque get-ups. Her favorite costume is a tan-colored gown, low shoes to match, and brilliant cardinal hose. Miss Wanamaker, daughter of the Postmaster-General, is going abroad in time to be presented at the drawing-room the Queen holds in June. The order for the gown Miss Wanamaker is to wear then is already in the hands of Worth, and he is busy preparing designs to be submitted to her choice. Miss Jeannettee Gilder, editor of the *Critic*, and sister of Richard Watson Gilder, is a tall, slender woman, rather masculine in feature and, whether in her editorial chair, on the street, or at home, her severely simple toilets vary but little in color or design. Her trim, compact, dark cloth gowns are usually made with a small coat and vest that open slightly to disclose a bit of white shirt front, dark satin tie and high collar, while wide linen cuffs encircle her wrists. Louise Lawson, the sculptor whose statue of Sunset Cox is occasioning considerable comment just now, is a bit of a woman, with golden-brown hair, gray eyes, a lisp and a vivacious manner. She wears when working in clay a dark blue blouse and trousers, and her studio costume is always of white linen—skirt and coat—the latter finished with extraordinary collar of coarse embroidery tied with the traditional knot of baby blue ribbon. With this costume yellow shoes are worn. The whole effect is rather more bizarre than attractive. Reports on all sides say that Princess Maud, the Prince of Wales' youngest and most loved child, has blossomed during the past year into a bewitching beauty, full of vivacity and charm of manner. So, too, another of Queen Victoria's grand-daughters has become lovely. The Duchess of Sparta, Princess Sophia of Prussia, third daughter of the Empress Frederick, has become, since her long illness of last year, greatly improved in appearance. She is fresh-complexioned, and has the carriage, regular features and blue eyes of her handsome father. When she went to Athens as a bride her figure was much to portly for one so young; now, it is sylph-like, and she further improves it by wearing cloth dresses made in London, and silk ones made in Paris. Princess Sophia was her father's darling, and is the favorite with her brother, the young Kaiser, who lavished presents and attentions upon her at the time of her marriage.

TO MEND GLASS.—Isinglass boiled in spirits of wine will produce a transparent cement which will unite broken glass so as to render the fracture almost imperceptible.

WHEN SEASONS CHANGE.

One of the more beautiful features of the year is afforded by the changes which occur when one season passes into another. These splendid changes, whereby nature preserves the even balance and order of things, was welcomed in the past as an unspeakable blessing. To-day they are dreaded by the majority of civilized people, as being fraught with desease. To a certain extent this fear is justified by the facts, but the reason of the danger and the danger itself lie in the artificial and unhealthful conditions of life which civilization has given birth to and not to any particular season. So far as nature is concerned, the physical activity of a person changes from time to time to meet external conditions. The heat of summer requires a larger use of lungs, glands and pores than does the cold of winter. The spring puts greater demands upon the locomotor muscles, while the autumn brings mostly in use those of the upper parts of the body. In this manner each portion of the organization receives a normal amount of exercise and a condition of health and strength is the natural result from the beginning to the end of the year. Civilization has revolutionized the natural modes of life. What with clothing and fuel, our bodies live in a perpetual summer or tropical climate, broken only by sudden draughts and short chills. We eat and drink more than we require, and use the same food and beverages the year through. We take insufficient care of the skin, and scarcely any care whatever of the interior of the physical system. The result is familiar to all. The blood slowly fills with impurities, which are transferred to the external and then later to the internal tissues. The vital organs act insufficiently or morbidly. A general feeling of malaise or debility is the first symptom of ill and that is invariably followed by one or more specific diseases. The slightest external cause is enough to bring about these results when the body is in the condition described. As the greatest external causes are the changes in temperature and moisture, the period at which the largest amount of sickness

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. MCGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

occurs are usually when the seasons change. The remedy for these unpleasant circumstances is easily found. It consists in keeping the pores active, the vital functions in good condition, the bowels open and the blood pure, This is accomplished in many ways but in none so quickly, pleasantly and cheaply as by the use of Ayer's Sarsaparilla, the superior blood-purifier—the one recommended by physicians and chemists of every school of thought and practice. It expels all impurities from the blood as well as from the tissues, it stimulates all the vital functions, and restores those which are lethargic to their natural activity and thus brings back the health and strength without which life is an unmixed evil. Above all, its action is so gentle that it interferes with the action of no organ, and occasions neither pain, nausea, nor disagreeable after effect. It should be used not only as a remedy, but as a preventive. Whenever any unpleasant or suspicious symptom appears, Ayer's Sarsaparila removes it in driving away the impurities in the blood, by which it was originally produced.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Makes an invigorating drink with water and sugar only. Delicious. Dr. E. T. Gauneau, Superior, Wis., says: "I have used it in cases of nervous debility and overworked brain, with the utmost satisfaction." Beware of Imitations.

A GREAT CYCLOPEDIA.

The twenty-second volume of the Columbian Cyclopedia is announced as just ready; the entire set is to be completed the present year, in 32 volumes, aggregating about 26,000 pages. Its price is remarkably cheap, only $25.00 for the entire set, with easy installment terms to those who want them. The high character of the work is vouched for by innumerable witnesses, among others by Prof. James Strong, S. T. D., editor of McClintock & Strong's Cyclopedia of Biblical, Ecclesiastical, and Theological Literature, who speaks of it as follows: "The Columbian Cyclopedia seems to me to strike a happy medium between the loose, superficial works, and the too elaborate and profound ones, which few are competent or desirous of using. Most of the larger general cyclopedias are overloaded with a mass of technical science and official detail that is embarrassing and useless to ordinary readers. The Columbian is eminently practical, sufficiently full, and carefully compiled, well got up, convenient in form and extent, remarkably cheap, and, as I should judge, admirably adapted to families and general consultation I think that if properly presented to the public it will have a very wide sale, and be an exceedingly useful work. There is ample room in the market for a Cyclopedia like this, which combines, likewise, the advantage of being an excellent Dictionary of the English Language." For free specimen pages, address the publishers, The Columbian Publishing Co., 393 Pearl Street, New York.

SUBMARINE BOAT.—The French submarine boat "Gymnote" was recently tried at Toulon, and demonstrated its ability to pass through a blockaded line and escape attention in spite of systematic efforts to watch, trace, or discover its course. According to the *Revue Industrielle*, it plunged and remained under water forty minutes. It rose to the surface at a distance of more than two miles and a half from its point of departure, and had passed under the watched line of demarcation without being seen. After having ascertained where it was, it reimmerged to return. It again crossed the line, but this time two of the parties on the lookout for it got a glimpse of it, not, however, sufficiently distinct to enable them to trace and pursue it. The course of the boat was in both instances rectilinear.

Perfect Cookery.

"Food made with **Cleveland's Baking Powder** keeps moist and fresh, and in this respect it is **superior to any powder I know.**"

Sarah L. Rorer

Principal Philadelphia Cooking School.

Only the cards of members of the N. Y. Hay Exchange appear on this page.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, April 13, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.

THE CENTURY DICTIONARY comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to
THE CENTURY CO., 33 East 17th St., New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month**, and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions**, arranged for practical use; timely hints to **Housekeepers**; cheering and helpful talks with **Mothers**; valuable information for lovers of **Flowers**; a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

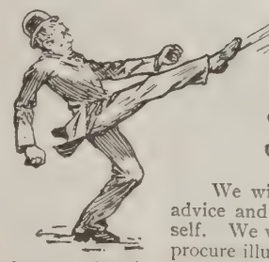
Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.



The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

THE ANALYST PUBLISHING CO.,

ELECTRICAL LENSES.

There is no end, and in fact no determinable limit, to the conjectures regarding the future possibilities of electricity. A writer in the *Electrical Review* believes that one of the "most glorious" of these possibilities is in the field of optical instruments. "What is a telescope?" he asks, proceeding then to answer "nothing but a combination of lenses or mirrors, the primary function of which is to bend or reflect a ray of light. But has it not been shown that an electrical field will bend a ray of light, and that a ray of light reflected from the polished pole of a magnet is peculiarly twisted? The part which electricity has hitherto played in astronomical science has been limited to a few technical applications principally associated with signaling and the making of chronographic records, but it is the destiny of this infant giant to work greater changes in the study of the heavens than has ever been dreamed of by man. Why is it so difficult and expensive to construct an immense telescope? From the time of Galileo to that of Clark steady work has been done, and each step has given us a larger object glass. The pupil of the eye is one-fifth of an inch in diameter, and can grasp but a limited amount of light. A 25 inch object glass will enable the eye to take in over 15,000 times more light, and with such a glass the moon can be seen as though it were only eighty miles away, but if the size of the object glass could be further increased the moon would be brought considerably nearer. To make a large object glass is the difficulty, and it is only after years of patient work of the most skilled men on earth and after repeated attempts that one can be produced which is accurate. Slight differences of specific gravity, changes of structure due to jarring, strains resulting from unequal pressure and changes of temperature, are all capable of ruining the work. But why not replace the glass, which is only a medium transmitting light at a different velocity from air, by a properly constructed electric field? It is conceivable that an electric field fifty feet in diameter could be arranged. Just what the nature of this field should be, with our present knowledge, we cannot say; but some day it will be known, and then the secrets of other planets will be ours.

STAMP COLLECTORS.

The collecting of postage stamps is generally regarded as one of the passing "fads" that, after having enjoyed a wide popularity some years ago, has gradually lapsed into "innocuous desuetude." This, however, is not by any means the case. Expert collectors are still industriously filling their books, and those who understand the trick of it frequently realize considerable sums for their collections. We know one instance of a gentleman who last autumn left a boxful of postage stamps, the gleanings of several years' intelligent effort in that line, with a New York firm to dispose of. The brokers estimated the worth of the collection at close upon four thousand dollars, and cheerfully advanced six hundred dollars upon receipt of the consignment. Many stamps possess, through their scarcity or other causes, a value immensely beyond that printed on their faces; and the handling of this particular kind of merchandise, although restricted to a few firms, has grown into a trade of considerable dimensions. Collectors who have not studied the history of stamps are often surprised at the number of different issues that are used by comparatively insignificant governments. It is difficult and expensive to secure a complete collection of stamps of the Central American republics. Brazil and Peru have all kinds of issues, while even the Spanish stamps used to be continually changed. This was done entirely in the interest of stamp collectors. There is a firm in America that used to supply stamps to these governments free of cost, on condition that the issue should be changed at least twice a year, and that all unsold stamps should be returned. The supply could thus be controlled, and a fancy price put on the obsolete issues. The extent of the traffic in rare stamps can be appreciated from the fact that these speculators made thousands of dollars annually after paying expenses.

MEAT AND MICROSCOPES.

The details of the new meat inspection law were announced at the Produce Exchange in this city on April 10, and according to the *Commercial Bulletin* some of its features provoked considerable merriment. The announcement, we are informed, was as follows: "It is estimated that the new meat inspection law will require 130 to 150 men with microscopes in Armour's packing houses alone. This gives an idea of the magnitude of the undertaking. Smaller houses cannot be handled as economically as the large ones. The Inspection Law will be put in force as fast as men and means and microscopes can be provided. The Secretary of Agriculture will not be able to put it into general operation this year, as Congress failed to make the necessary appropriation, and is limited to such general funds as they can spare. He will only apply the law in such houses as ask for it this year, and gradually feel his way, as there are many difficulties to overcome." This statement was read to a group of the trade. The comments that followed were decidedly humorous. One prominent broker declared that he would quit his business and go into microscopes; another, that the microscope manufacturers must have been behind this meat inspection law when it passed Congress; still another, that the microscopes must first be tested by an investigation of the heads of the Interior Department at Washington before they would be accepted. A leading exporter said that the law would, no doubt, lead to new discoveries in Bacteriological Science, and advance the market for microbes as well as for microscopes.

A NEW ASSOCIATION.

The Ladies' National Health Protective Association has been incorporated at Washington, D. C. The directors for the first year are Clara Borton, Jane H. Spofford, Alice C. Fletcher, and Emily L. Sherwood, of the District of Columbia; Margaret W. Ravenhille, Fannie J. Helmuth, and M. Louise Thomas, of New York. The objects of the association are to protect the health of the people of the United States by taking such action from time to time as may secure the enforcement of existing sanitary laws and regulations by inviting the attention of the proper authorities to any violation thereof, and to procure the amendments of such laws and regulations when they shall be found inefficient for the prevention of acts injurious to the public health; and co-operate with the health officials of the United States and the various States and cities.

DINING AND WINING.

HOW WINES SHOULD BE SERVED ON THE DINNER TABLE.

It is optional with the host and hostess whether wine shall or shall not appear on the dinner table. Whether it is good for it to be there or not is another question. By the word "wine," I mean the fermented grape juice and not distilled spirits. Liquor or spirits designate, as a class, the alcoholic drinks, while wine is commonly applied to the non-alcoholic ones. At a private house one is more apt not only to get good wines, but wines properly served. More lies in this last fact than most persons know. The heavier wines must be taken from the cool wine cellar two or three days before they are needed, and placed in a warmer room; then several hours before they are to be drank they must be most carefully decanted, leaving behind whatever the wine has thrown off while ripening in the way of sediment. The presence of this sediment proves the wine's age, and to fool the credulous public, what is necessary for making it is often added when bottling is done. It is impossible for a caterer to keep his wines in prime condition for serving on call. If they are taken from the cellar to the proper heat for drinking and returned to the cellar again they will be ruined by the shifting and by the changes of temperature. The wines considered as table wines are port, Madeira, sherry, sauterne, red French wine or Burgundy, champagne, Bordeaux, (claret,) and those from the Rhine. The list is given according to the amount of alcohol contained in each, beginning with port. Liqueurs are stronger than red wines, but, strictly speaking, they are not table wines. Fashion dictates the kind of wines to be used, and custom the manner of serving. The routine of wines at a dinner is: Chablis or sauterne with the oysters, dry white wines with the soup and fish; then, as the courses follow, sherry, claret, champagne, Burgundy, and, last of all, a sweet wine or liqueur with the dessert and for the *pousse-cafe*. It is often said that red wines should precede the white ones, but it is matter of taste which should be introduced first. It is not at all necessary that all of the wines mentioned should appear on a table; at a private house three wines are sufficient, or, in reality, two are enough. The mixing of wines is a great mistake; the process upsets the equilibrium and the digestion quicker than anything else. A good dry white wine or sherry for the first two courses, claret or Burgundy next, and a champagne for a finish is enough for a dinner party. Or a red wine followed by a champagne, if both are excellent, is much to be preferred to a variety of indifferent wines. The wines of a private cellar give more tone to a dinner than any dish or number of dishes, and it is sufficient distinction that you should be known for one kind of wine alone. The proper way for buying all wines but champagnes is in the cask; you run a better chance of getting a purer article, although almost all wines but the lightest are adulterated for exportation. Alas, that Americans should know it, the best of all foreign wines are kept at home for the consumption of those who make them. Added to this we are not supposed to know a good thing when we get it, hence nearly all of the wine that comes to our market is doctored. It is not generally known that red and white wine are made from the same grape. For the white wine the juice alone is fermented: for the red wine the pulp and skin are pressed, and what comes from them by the process is added to the juice before fermentation begins. The coloring matter is in the skin, and the darker the skin the deeper the color of the wine. Colored wines are astringent and strengthening. Under cover of this coloring foreign matter enters many red wines. A singular fact is that as some wines grow older they lose color, while others darken. After port is bottled it grows lighter. A certain amount of change goes on by which the wine throws off whatever is coarse in its nature, gaining by the process an increased delicacy in flavor and aroma. Clarets, on the contrary, grow darker, and what is often sold as "old" in bottles has had some black wine added. All wines in which the fermentation is arrested, or in which the sugar is exhausted before the ferment is, do not improve with time. With them whenever a favorable opportunity or condition occurs, by the admission of air or a change in temperature, an acid fermentation begins and the alcohol of the wine is turned into vinegar. This process can be often arrested by the addition of sugar—possible to the wine maker or merchant—or changing the wine to a cooler temperature. Through inattention good wine may go to its own destruction. After color wines are again divided into two classes, light and strong, these are subdivided into "sweet" and "dry." All of the French wines are light—sherry, Madeira, port are heavy or strong wines. If sugar remains after fermentation is completed, and the wine is left so it is known as sweet wine. When the sugar is exhausted while the change is going on, an acid flavor prevails and the wine is known as "dry." The "bouquet" of a wine is a volatile, odoriferous constituent; it is at once a perfume and a flavor; it is refined and improved by age; it is this that gives value to the liquid. As white wines come with the first courses they should be considered first. Sauternes are the white Bordeaux wines. The grapes for making them are grown on the hilly banks to the left of the Garonne. On the right of river are the white wines known as Graves. The name sauterne comes from the French word *sauter*, to jump or ascend; the hills on which the fruit grows give the wine its name. The white Burgundy wine most often drank is Chablis; it is far inferior to the best white wine grown on the Garonne. Of the French wines Chateau Yquem and Latour Blanche are rivals and stand first in favor. The Rhenish wines are white wines that should be more often seen at the table. The peculiar taste of these wines does not lead to their popularity; they require an educated palate and an appreciative one for their dry, aromatic taste. These wines are often ordered by the physician, being great blood purifiers. They are drier than the French wines and improve more than all other wines with age. The German cellars have wine in casks two centuries old. The most celebrated vintages are those of the earlier part of this century. It is needless to say that samples of such vintages seldom appear on our tables. A fair Hockheimer, Johannisberg, or Rudesheimer of recent date is all we can hope for. These wines can be decanted or not as one wishes, but the temperature at which they should be drank is 40 deg. Fahrenheit. If sherry replaces a white wine, or is served after it, it must have the same temperature and must be decanted. The red Bordeaux wines come next. They are known here under the name of claret—a term unknown to the producers or in the market. It is a corruption of the word *clairet*, applied in France to all rose-colored wines. These wines are divided into classes by the districts in which the grapes are grown, and again divided by the vineyards, whose names they generally bear. We all know the finest claret, but few of us a good claret. Those of the first *crus*, Chateau Lafite, Chateau Latour, Chateau Margaux, are the best grown on the native shores and the ones most often met with at our table. Pontet-Canet is the next favorite; it belongs to the fifth *crus*; the virtues of the intermediate clarets are almost unknown. All the excellent wines after the first *crus* are kept in France, but we are spared the peasant or *bourgeois* wines exported under the head of *vins ordinaires*. These we receive warmly, and pay for highly in our ignorance. Although we are told not to "look on the wine when it is red," claret surely answers the scriptural definition of "the wine that maketh the heart glad." The wine has the taste of flowers as well as that of fruits; its "bouquet" suggests violets, mignonettes, the raspberry and the grape. It cheers the heart, pleases the palate, imparts a gentle heat to the stomach, and does not go quickly to the head. Fourteen ounces, or nearly a pint, an authority says, can be easily drank by the most delicate without having any intoxicating effect. Good claret should be "sound, fruity, and soft as satin." It is the most useful and the most healthy of all wines; it assists digestion, and being free from sugar leaves no after-taste nor headache. If Burgundy is a kingly wine, claret is the wine of the gentleman and the connoisseur. Claret should always be decanted and served at a temperature of 60 or 80 deg. Fahrenheit. The decanter into which it is poured should be warmed before the wine is poured in, which should be done several hours before dinner is served. Because they can be decanted the *vins ordinaires* can often masquerade as something better. If you are known for your claret—and you can be known for nothing better—it is taken for granted you have wine from the first *crus* or something very good that you, as a connoisseur, have selected. You do not require the label to prove the vintage, as a beautiful hostess, who knew her wines better than her guests, did. "James," she said, reprovingly, to her butler, as he poured the translucent red wine from a bottle free of all label, "you have rubbed the label off!" Burgundy can be substituted for claret or follow it. If both appear at table, the former is poured with the salads. It was supposed to lose its flavor by travel, but now the opinion is held that a trip or two across the sea improves it. The most famous brands are Romanée, Clos Vougeôt, and Chambertin. The last was the beloved of a King and an Emperor, and is the kind most often in our cellars. Burgundies differ greatly in taste, and anybody knowing the wine at all can easily distinguish a Chambertin from all others. They rank higher than the clarets, growth to growth, sell higher, and are well worthy the higher price. Good Burgundy and old burgundy has a sediment—it should therefore be carefully decanted. It should be drank blood-warm, at a higher temperature than any other wine. It is a generous wine that improves with age. Champagne can be brought on before or after the generous red Burgundy. At the average table it is the wine served last. It is the favorite wine of the public; as the public must have it, it often has it pretty bad. The vineyards of Epernay and Rheims produce the most celebrated wines. The sparkling "dry" champagne is the most popular, although the connoisseur and epicure consider the *cremant* or still wine by far the best. New vintages are constantly being introduced, but fashion and the dryness of the wine have more to do with the brand rejoicing as the favorite of the moment than anything else. Its lively and effervescent quality is given to the wine by artificial means; rock candy and fine brandy do the work. Champagne gains nothing by being kept, and its owner often loses much by leakage, etc. It is always served in its own bottle. The flavor of this agreeable beverage is ruined by ice applied externally, or put in the glass. What is known as champagne *frappe* is champagne ruined. Frenchmen drink it at 40 deg. Fahrenheit; wicked Americans drink it at 35 deg. or colder. The delicacy of the "bouquet" is destroyed by the cold. A certain warmth is as necessary to the perfume of wine as it is to that of flowers. Port often comes with cigars instead of a liqueur. It is good for the stomach and good for gout. It comes last, but is often blamed for the effects of "drinks" that have preceded it. It is the most alcoholic of table wines, and it is more often something else than port. The ingenious Portuguese imitate the product of the grape, and a factitious wine results. But, like the old darkey who bought a buzzard for a turkey, and ate it for a turkey, we buy what goes for a port, and drink it for a port. Their neighbors, the Spaniards, understand how to make sherry in the same way. To both of these wines a large amount of brandy is added. It takes the aroma of port fifteen years to overcome the brandy put into a cask, sherry ten years. While the grape-juice is trying to assert itself the wines should be kept in the cask. In a quarter of a century they are ready for the decanter. All wines that can be bought in the cask should be. You will get a better wine that way. The

strong wines can be left in the wood to grow mellow, and the lighter wines can be easily bottled. You will lose a few quarts of wine, and make the bottler and his assistant drunk by this, but in the end you will gain. You should have a different colored sealing-wax each year. In that way you can always keep the run of the different vintages. A series of five colors will do, as very few housekeepers can or do keep more vintages on hand at once. This suggestion is offered in behalf of claret especially. Wine in the cellar must be carefully watched; the fragrant liquid must be looked after seriously. Wine that is corked without sealing or metal caps can be spoiled in a damp cellar. The mould that gathers on the outside of a cork can eat its way in and affect the contents of the bottle. The banishing of wine from a home table should depend on the family finances and not on personal prejudice. All wines contain some alcohol, but it is not for an intoxicating effect that they are drank—at least it should not be so. It is statistically proved that there is less inebriation among the people of wine-producing countries than elsewhere. Where the grape grows there is neither corn nor rye mash. Instead of wine giving or fostering a love or taste for that which gets into the heads or heels—whichever it is—and reduces man to the level of a beast, it has just the opposite effect. In wine there is a great chance of sinning, not in its use but in its quality. The wine you pay most for is generally, but not always, the best. All varieties of wines differ in taste and body, but vintages of one wine are unlike in character. This is due to the temperature when the fruit was growing and fermenting, to the amount of moisture during a vintage, and to the condition of the grapes sent to the press, whether over-ripe, not ripe enough, or otherwise imperfect. Passing "the bottle around the table" is a social phrase that has more friendliness than sense in it. Skill is required to pour wine, and careless handling means destruction. The flower or lees, even of decanted wine, are disturbed by the process, and instead of a clear, ruddy, fragrant liquid, a cloudy, muddy one appears in the glass. If you object to wine on principle, you will do no good by refusing to have your glasses filled. You will not get any credit by refusing. The host or hostess will probably notice your glasses unfilled and call the servant's attention to the fact, thinking you have been overlooked. Then an explanation will have to follow that ought to be embarrassing. If the wine is good it is a pity to waste it—but the best way is to allow your glasses to be filled without a protest. You need not drink the wicked stuff. The indulgence to excess ruins the reputation of many things less good than wine. Many waters are more death-dealing than wines, but you can suit yourself, as Rudyard Kipling says in a poem, "We have drank your water and wine." We can all, if not notional, safely follow St. Paul's advice to the good and youthful Timothy: "Use a little wine for thy stomach's sake."

GENESIS OF THE ELEMENTS.

ELEMENTARY SEED SCATTERING OF CREATIVE FORCE.

It is now generally acknowledged that there are several ranks in the elemental hierarchy, and that besides the well-defined groups of chemical elements, there are underlying sub-groups. To these sub-groups has been given the name of meta-elements. The original genesis of atoms assumes the action of two forms of energy working in time and space—one operating uniformly in accordance with a continuous fall of temperature, and the other having periodic cycles of ebb and swell, and intimately connected with the energy of electricity. The centre of this creative force in its journey through space scattered seeds or sub-atoms that ultimately coalesced into the groupings known as chemical elements. At this genetic stage the new-born particles vibrating in all directions and with all velocities, the faster moving ones would still overtake the laggards, the slower would obstruct the quicker, and we should have groups formed in different parts of space. The constituents of each group whose form of energy governing atomic weight was not in accord with the mean rate of the bulk of the components of that group, would work to the outside and be thrown off to find other groups with which they were more in harmony. In time a condition of stability would be established, and we should have our present series of chemical elements each with a definite atomic weight—definite on account of its being the average weight of an enormous number of sub-atoms or meta-elements, each very near to the mean. The atomic weight of mercury, for instance, is called 200, but the atom of mercury, as we know it, is assumed to be made up of an enormous number of sub-atoms, each of which may vary slightly round the mean number 200 as a centre. We are sometimes asked why, if the elements have been evolved, we never see one of them transformed, or in process of transformation, into another? The question is as futile as the cavil that in the organic world we never see a horse metamorphosed into a cow. Before copper, *e. g.*, can be transmuted into gold it would have to be carried back to a simpler and more primitive state of matter, and then, so to speak, shunted on to the track which leads to gold. This atomic scheme postulates a to and fro motion of a form of energy governing the electrical state of the atom. It is found that those elements generated as they approach the central position are electro-positive, and those on the retreat from this position are electro-negative. Moreover, the degree of positiveness or negativeness depends on the distance of the element from the central line; hence calling the atom in the mean position electrically neutral, those sub-atoms which are on one side of the mean will be charged with positive electricity, and those on the other side of the mean position will be charged with negative electricity, the whole atom being neutral. This is not a mere hypothesis, but may take the rank of a theory. It has been experimentally verified as far as possible with so baffling an enigma. Long-continued research in the laboratory has shown that in matter which has responded to every test of an element, there are minute shades of difference which have admitted of selection and resolution into meta-elements, having exactly the properties required by theory. The earth yttria, which has been of such value in these electrical researches as a test of negatively excited atoms, is of no less interest in chemistry, having been the first body in which the existence of this sub-group of meta-elements was demonstrated.—*London Chemical News.*

ART OF WOOD ENGRAVING.

THE CHINESE CLAIM TO HAVE KNOWN IT 3000 YEARS.

The art of engraving on wood was introduced into Europe from China by merchants trading with that country. The Chinese claim to have known the art a thousand years before the birth of Christ, but though that is probably not true, it is certain that they knew it before any European nation did. Early in the fifteenth century illustrations of the Bible and playing cards were printed from wooden engraved blocks. These two things were in a way the first to be printed in Europe. From printing with blocks to the use of movable type was a natural step. A full-length portrait of St. Christopher, done in 1423, is one of the earliest wood engravings. It is remarkable for the attempts at shading. Another good specimen of early wood engraving is the title page of a Sallust printed in 1481. Sallust is seen dictating to three scribes, one of whom, Joannes Brittannicus, John of Britain, writes with two hands. The printing of playing cards and of Biblical illustrations became so general an industry during the fifteenth century that the Venetian Senate, in order to protect the city's own share of it, forbade the importation of them. At the same time large numbers of block books, printed by the use of engraved wooden blocks, were published. "The Poor Preacher's Bible" is among the best known of these. It contains forty pages printed on one side only. The ink is pale brown, and the transfer from the blocks to the paper was done with a rubber. These books immediately preceded the introduction of printing with type by Guttenberg and Caxton. The text and titles of the illustrations are done in handwriting in the block books There is no indication on them of the date or place of publication, but most of them were made in Holland and Germany. "The Mirror of Human Salvation" is a book in which the illustrations were printed from blocks and the text from movable type. Each process was done separately. The inventors of printing devoted more attention to the printing of Bibles than anything else, and many of them were illustrated. The Cologne Bible, printed, somewhere between 1470 and 1475, contains 109 engravings, which show a strong improvement on any earlier work remaining to us. The borders of the volume are decorated, and the designs often deal with things far removed from the thoughts of the inspired writers. "The Chronicles of Nuremberg," 1491, contains the first example of the process of crosshatching, by which color is produced by lines crossing each other obliquely. The best of the earliest wood engraving was done in Italy, but in the sixteenth century the art took great strides through the example of the great Albert Durer. By the use of strong contrasts in black and white he did away with the need of colorings. He is best known for his four series of Biblical illustrations. The Apocalypse of St. John, the Larger Passion of Our Lord, the Life of the Virgin, and the Smaller Passion of Our Lord. Another series, the Triumph of Maximilian, is famous. The herald is a representative piece of this work. The beast on which the herald is mounted has the hind legs and tail of a lion, the body, wings, claws and neck of an eagle, with a lion's face where the eagle's might be. All is very fantastic, but artistic. Holbein, who flourished a few years after Durer, carried the art still further ahead. His "Dance of Death" and "Figures of the Bible" are among the monuments of the engraving art. After Durer, Holbein, and their pupils had passed away it declined, and at the end of the sixteenth century was in its lowest state. From that time on it did not flourish greatly until the eighteenth century. Then there were some interesting revivals, including the works of Hogarth. To Thomas Bewick, the glorious illustrator of British birds and beasts, is due the creation of the present art of engraving on wood. He began to work at the end of the eighteenth century. Probably the best work is done at the present time by American wood engravers.

ROUGH ON RUM.—Half a teaspoonful of chloride of ammonium in a goblet of water will almost immediately restore the faculties and powers of locomotion to a man who is hopelessly intoxicated. A wine glassful of strong vinegar will have the same effect, and is frequently resorted to by druken soldiers to enable them to return steadily to their barracks.—*Medical Summary.*

STONE-SOLED SHOES.—A German inventor proposes to make boots with stone soles. He mixes with a water-proof glue a suitable quantity of clean quartz sand, which is spread on the thin leather sole employed as a foundation. These quartz soles are said to be very flexible and almost indestructible, while they enable the wearer to walk safely over slippery roads.

GREAT DEPRECIATION.—A London financial authority says that the magnitude of the losses which have been sustained by English investors in Argentine securities may be obtained from the statement that the decline within the past two years in the value of Argentine railway stocks and bonds listed on the London Stock Exchange amounts to $150,000,000. The par value of the securities is $336,359,000, of which a little over $100,000,000 were guaranteed by the Argentine General Government, over $42,500,000 more had the guarantee of the provinces, and nearly $183,750,000 are without guarantee.

CURIOUS PATENTS.

SOME OF THE SINGULAR DEVICES OF INGENIOUS INVENTORS.

The Patent Convention mentioned by the AMERICAN ANALYST, March, opened on April 8. The Patent Office was originally a branch of the State Department, but it was made a part of the Department of the Interior at the time of the organization of that branch of the Government in 1849. For a great many years one of the rules of the Patent Office required that a working model be furnished with every application for a patent on a device. This has been modified so that in most cases it is not necessary to file more than the specifications. Still, many models are filed with the Patent Commissioner, and the accumulation of them is making it more and more necessary every day that the Patent Office should have better quarters. There are about 200,000 models in the office now. The oldest of these is a model of the cloth-shearing machine, on which a patent was granted to S. G. Dorr, of Albany, N. Y., Oct. 20, 1792. It is in good condition and repair, because it was renovated after the fire which destroyed so many models of historical interest and of inestimable value in 1877. There have been two fires in the Patent Office. The first of these took place in 1836, on Christmas Day, and destroyed about 7,000 models. The second fire was far more disastrous. It occurred on Sept. 24, 1877, destroying 87,000 models of patented devices and 27.000 models of devices for which applications for patents were pending. Among the models which suffered in the second fire was that of the cotton gin invented by Eli Whitney in 1794. A duplicate of this model was built, and it stands in the Patent Office to-day. Among the other original models in the Patent Office are Colt's first revolver, patented in 1837; R. M. Hoe's double-cylinder printing press, patented in 1842; Howe's first sewing machine (a queer contrivance run by hand by an oscillating crank); Morse's electric telegraph, the first engine run over the Baltimore and Ohio road (patented by Ross Winans in 1833); the Gatling gun, and the Hotchkiss gun. There are 186 classes of inventions altogether, and these are divided into more than 3,000 subjects. The perpetual motion crank is the most frequent applicant for a patent. All of the devices which have come down from ancient history for the establishment of perpetual motion have been repeated over and over again by the applicants for patents in this modern day. The Commissioner of Patents keeps on hand a publication in two volumes called "Perpetuum Mobile," an ancient chronicle of devices for establishing perpetual motion. They are more than 2,000 years old, and every idea presented to the Patent Office to-day for a perpetual motion machine can be shown to have originated with the ancients. The applicants for these patents are not among the least known of the people who file applications with the Patent Commissioner. The roll of claimants contains the name of Harriet Hosmer, the sculptress and other well-known people. The experience of the Patent office of this country is not unique. The French Academy was overrun with applications for perpetual motion patents in the last century, as were the like bureaus of the other Governments of Europe, and finally, the French Government, in 1775, gave notice that no more applications of this kind would be considered. The Commissioner of Patents of the Interior Department of the United States disposes of the perpetual motion cranks more diplomatically, but just as expeditiously. To every applicant a stereotyped reply is sent. It requests the inventor to file a working model of the machine. This silences the applicant, for, as perpetual motion is impossible, no working model of a perpetual motion machine will ever be made. Some models are filed, though, and they are among the curiosities of the Patent Office. The most common device is an arrangement of shifting weights, one side proponderating over the other constantly. Another favorite is a triangle formed of a chain, to one side of which a series of automatic hooks continually attach itself, causing that side to be heavier than the other. Abraham Lincoln was an inventor. In 1849 he patented a device for lifting boats over shoals. There is no record of its having been put to any practical use. Dr. Mary Walker patented a device for teaching children to read and spell by the use of rebuses and conundrums. Senator Burnside patented a gun in 1850 which he endeavored to have the Government adopt at the time Jefferson Davis was Secretary of War; but his efforts only resulted in creating a breach between him and Davis which has become historical. Devices with well-known names attached to them attract attention for this reason; but they are not nearly so interesting as the patents which are taken out by cranks. These may not illustrate the progress of the United States in invention so well as the electrical devices of Edison, but they are more interesting to the visitor who examines the show in the glass cases ranged along the aisles of the top floor of the Interior Department building. Among the most amusing of these are the patents on weapons of a substantial and unique character. The connon-plough is one of the best of these. The plough beam is hollow, and it is to be used as the barrel of a small cannon, loaded with a cannon ball of moderate size, and turned upon the invader of the tranquility of the fields with deadly effect. Instead of beating the ploughshare into a sword this inventor proposed to twist the plough handle into a cannon. Another inventor has devised a unique mountain howitzer. He proposes to take the recalcitrant mule as a base, mount a small cannon on his back, attach springs to his hind legs to carry off the recoil, and go frisking about the enemy with his animated cannon. A companion patent for this is one for the use of stilts attached to two of the legs of a horse "so as to plough with the animal on a hill side." Another granger device for which a patent was asked, but not granted, was for "tying a weight of specific gravity to a cow's tail to keep her from switching it when you are milking." A patent was granted to a man who noticed that the moth miller got into the bee hives at the time when the chickens went to roost. Profiting by this coincidence, he prepared a device by which the weight of the chickens going to roost was to operate a door closing the hives. In his application the inventor said: "I expect that after a time the miller may get sense enough to keep watch of the chickens and come in a few minutes earlier." The slot machines are the most numerous of all devices brought before the Patent Commissioner now. It is not a new idea. It was used in the temple of Diana 2,000 years ago. There are hundreds of new slot machines awaiting action by the Department and hundreds have already been patented. The most elaborate of them contains machinery to furnish the passer-by in exchange for his nickel with any one of a dozen drinks or of a dozen or more styles of solid refreshment. One slot machine will deal out fourteen kinds of liquor while another is intended to retail ice water. The latter has been used a little in Western cities. A patent which ought to interest the natural gas companies is one for sinking a boiler so far into the ground that the natural heat of the earth will generate steam. An applicant for a patent for gas announced that he proposed to make it by "heating air red hot." A revolving house is intended to have its front windows continually receiving the rays of the sun. A tower for use in cemeteries is the invention of a man who has been reading evidently of the horrors of burial alive. This tower is to be erected on the top of the coffin after it has been placed in the grave. The top of the coffin is not fastened down with screws, but is arranged to fly open on the pressure of a spring within. If a man who has been burried alive comes to life under one of these patent arrangements, he has only to push the spring, open the coffin, ascend the ladder, and thus reach the open air once more. The man who devised this apparatus has probably not made a fortune out of it. It was patented in 1868. A man patented some time ago a device very suggestive of the mule howitzer. He proposes to put springs under a house to prevent it being overturned during an earthquake. An application was made a long time ago for a patent on a device "to enable a dog to turn a short corner." The inventor proposed to tie a palm-leaf fan to the dog's tail. He said that he had noticed how a dog used his tail to help him keep his equilibrium when tacking, and he proposed to assist the dog by enlarging the available area of tail.

ADULTERATED FOOD.

THE "METROPOLIS" INDORSES OUR VIEWS AS TO A REMEDY.

The AMERICAN ANALYST is a weekly publication, devoted to the careful study and exposition of everything relating to man's physical need and comfort. It is a recognized authority with grocers and large consumers on all matters relating to food products or dietary preparations, their purity, composition, and healthfulness. It has devoted much time and space to the subject of the adulteration of food, and has urged the duty of the State to protect the innocent or ignorant consumer against the greed and wiles of conscienceless purveyors, whose only object is money making. Speaking of adulterated food, the ANALYST very wisely says that where the customer can detect the adulteration at the time of purchase, it is only his own cupidity that betrays him. He takes a poor article because it is cheaper, and, as he hopes, will answer the same purpose as that which is pure and would cost more money. But when the mixture is of such a character that it cannot be detected by inspection, and especially where the articles used as adulterants are noxious or any way injurious to health, it would seem to be within the province of legislation to provide a remedy. How shall this be done? In what way may the law properly interfere to protect the innocent from the guile of the deceiver? Hitherto the efforts in that direction have been confined for the most part to restraints upon the producer. This has been resisted on the ground that it interfered with valuable industries. The pure hog's lard, say the mixers, will not do to ship, will grow soft in any climate, and becomes utterly worthless in a hot country. Therefore the product of cotton seed, and the various other hardening compounds that are added, are really, as they insist, a benefit to mankind. Oleomargarine, according to the patentee, is a blessing to the race. Beef fat or any greasy material "digested with a pig's stomach," as the patent provides, and deprived of its repelling odor, is represented as not only a desirable addition to the world's products, but is far healthier than poor butter that comes from the dairy. Therefore the producers churn it with a little cream to make it taste like the product of cow's milk, and sell it, not only for boarding-house purposes, where it is largely consumed, but even for the tables of private families, many of whom depend on unscrupulous grocers, and cannot detect the imposition. It seems to us that a way might easily be provided to give these ingenious and enterprising manufacturers the full benefit of their industrial undertaking, and at the same time defend the people from undetected fraud. Let the law insist that every one who puts up any food product for market shall stamp it with his name and address, and affix a true statement of the contents. If he wishes to keep the proportions a secret, he may be allowed that reserve, but compel him, under a sufficient penalty, to describe by its proper title every article contained in the mixture. The committee of Congress, in their investigation, found that a large quantity of a manufactured article was put on the market labelled "Pure Family Lard" which had nothing in it that came from the hog. If the actual contents of every package had been printed or branded thereon, and the people had chosen to purchase it, no one would

have a right to interfere. Every package of baking powder should have on it the name of the ingredients. If the consumer has no objection to tartaric acid or alum, it will not hurt the sale to have the fact of their presence duly inscribed. Instead of "Pure Old Java" on a package that purports to be ground coffee, let the inscription read "A mixture of coffee with chicory, roasted wheat, and beans, split peas, rye and potato flour, mangel-wurzel, acorns, lupine seeds, ground date stones, scorched cocoa shells, licorice, and burnt sugar," or so many of these as have been added. Instead of "Pure Ground Pepper" we might have "Pepper leaves with mustard, wheat flour, sago, charred wood, chillies, rape seed, potato, manignette, chicory, rye, olive stones, bone dust, and marine salt." We have not exhausted the list of things actually found as substitutes or adulterations of pure pepper, but this would do for a beginning. For mustard the label might read, "Ground mustard mixed with wheat flour and colored with turmeric or Martin's yellow demitro naphthol." If this did not suit, we have seen cayenne pepper, gamboge, potato starch, pea flour, radish and rape seed, linseed meal, yellow ochre, chromate of potash, plaster of Paris and clay in a package called mustard. We have named nothing that is not common in the packages of these so-called "spices." No manufacturer ought to object to this test. If his added ingredients are innocuous, and the people are likely to esteem them, it is only fair to let the buyer know where he can get them. If he purposely or "inadvertently" omits anything from his descriptive list which the package contains, let him suffer for his want of memory or intended fraud. For table use, the greater portion of the golden fluid now offered in beautiful glass bottles, with showy labels, as the product of the olive, might more truthfully be described as "Pure cotton-seed oil, for salad purposes." Why not compel the producer to print the truth on his ticket? Then those who wish to patronize this "great and growing industry," as it has been recently described, would know exactly what they were eating, and no one would be wronged in the matter. We suggest that this would solve some of the vexed problems, and remove every ground of complaint from the manufacturer who prepares these adulterated or substituted products, and insists that he is contributing to the sum of useful inventions.—*The Metropolis, April* 13.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish, trout, sturgeon.

VEGETABLES. — Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

COD-HEAD SOUP.—Select a large cod-head, wash it, and put it in four quarts of cold water and let it boil for an hour. Strain the soup through a sieve; add three-quarters of a cupful of rice and a finely chopped onion and carrot; simmer for nearly an hour, then add all the fish from the head and season with pepper, salt, and chopped parsley, and serve.

CALF'S-FOOT JELLY.—Boil eight calves' feet in just enough water to keep them well covered until the water becomes a jelly, then remove the feet, and add to the jelly one pound white sugar, one quart port wine, the whites and shells of two eggs; let it boil for four or five minutes.

ROAST CALF'S HEART.—Make a forcemeat with four ounces finely chopped suet, a cupful of fine bread crumbs, some finely chopped lemon peel and parsley, a little grated onion, salt, pepper, a dash of nutmeg, and the yolk of an egg. Fill the heart with this, and roast in a good oven, basting it frequently with hot water in which some butter has been melted; dredge with flour a quarter of an hour before it is done.

OYSTER TOAST WITH POACHED EGG. — Mince two dozen raw oysters; put them in a stew-pan with an ounce of butter, a dash of salt and pepper, and a gill of oyster liquid. Simmer three minutes; moisten slices of toast by pouring a little of the liquid upon it; add the oyster mince, put a poached egg on top, and serve.

SAUCE FOR FRESH PORK.—Slice and fry lightly three good sized onions, cover them with broth or water, add a few chopped mushrooms, a few whole cloves, and a little vinegar; boil gently for half an hour; skim, strain, and if too thin thicken slightly with browned flour rubbed into a little butter.

LOBSTER PATTIES.—Fill some small pattypans with puff paste or good rich crust and bake them. Remove the meat from a boiled lobster, cut it into small pieces, season it highly with salt, pepper, cayenne, and a dash of lemon-juice, and heat to the boiling point in two large table-spoonfuls of butter. Fill the freshly baked tart shells and serve at once.

SPANISH RICE.—Boil one pound rice in salted water till it is quite dry, then add two large tomatoes, a half cupful of grated cheese, and some pepper; heat a platter, pile the rice on it, garnish with thinly sliced tongue and serve.

JAM RISSOLES.—Roll out some crust quite thin and cut into pieces about three inches wide and four long; put a spoonful of jam in the centre of each, fold the edges together, press them so that they will stick, and bake in a hot oven.

CHEWING GUM.

IS IT MADE OF GUM OR OF PARAFFIN?

The fine distinctions required by legal definitions frequently threaten confusion, even when the facts appear to be perfectly clear. There is no room for doubting the inconvenience and danger which may arise from the accumulation of a mass of paraffin wax in the intestines; and yet when any legal interference with the sale of chewing gum, containing 50 per cent. of this substance, is attempted, the charming uncertainties and quibbles which arise are more amusing than edifying. In a recent prosecution at the Hanley Borough Police Court it was first contended that the 14th section of the Food and Drugs Act, which relates to the division of the substance in the presence of the seller at the time of purchase, had not been complied with. Then it was submitted that the article was not one of food, since it was sold simply for chewing. Then it was suggested, that as sweets are so utterly indefinite in their composition, it was impossible to deal with them as ordinary articles of food. And the climax was reached in the contention that it was not sold to the prejudice of the purchaser, as the complainant said he did not intend to eat it. This was extremely ingenious, but the purchaser happened to be the inspector of nuisances, who was merely collecting evidence. The case ended for the present with the imposition of a fine, on the ground that the substance was sold to the prejudice of the purchaser, inasmuch as it was not in the nature of the substance and quality of the article demanded by the purchaser, who asked for gum and got paraffin wax. If the case is ever taken to a higher court, it is quite possible that it may be argued that the complainant did not ask for "gum," but for "chewing gum;" that he did not get "paraffin wax," but only 50 per cent. of "paraffin wax," and the remaining 50 per cent. of unknown ingredients which sufficiently bring the substance within the legal meaning of "chewing gum." But what is "chewing gum?" The following definition might be suggested: A substance of very variable composition, ignorantly employed by children, which, when containing paraffin wax, may lead to very grave dangers, and the sale of which should be prohibited.—*London Lancet.*

BELLAMY'S VISION.

AN ATTEMPT AT CO-OPERATIVE HOUSEKEEPING IN MONTREAL.

Mr. Roswell Fisher of Montreal, whose article on co-operative housekeeping in the *Nineteenth Century* attracted general attention, gave an address on that theme a fortnight ago at the Workingman's School in this city. Mr. Fisher told his audience that some two or three years ago, after nearly twenty years' study of the question of co-operative housekeeping, he found himself in a position to carry out the conclusions at which he had arrived on a scale not so large as he desired, but sufficiently large to admit the essential feature of professional management. He accordingly built, on the principal residential street of Montreal, an apartment house containining twenty apartments, each with eight or ten rooms and forming a complete dwelling but for the omission of appliances for cooking. In the basement, in addition to the furnaces for heating the house, water for baths, etc., and other conveniences of a good apartment house, Mr. Fisher furnished a complete club kitchen, a small private suite for the manager, and a club laundry, with a dining-room. The kitchen is in direct connection with every pantry by electric bells and speaking tubes, and there are two dumb-waiters at convenient points, each serving into ten pantries, two on each floor. In addition to the usual kitchen plant, there is a butler's tray for each tenant and sufficient covered tins and white ware in which to send the meals to the individual service-rooms. In the leases, which are for at least a year, there is a clause requiring each tenant to pay quarterly a uniform tax or kitchen subscription, which assists in covering certain fixed charges of the kitchen, such as the cost of management, the interest on and the depreciation of the plant, fuel and gas, leaving only the wages of the kitchen help, the cost of the food, and a calculated profit of about six to ten per cent. for contingencies. The service of meals is managed as follows; Every day a simple bill of fare for breakfast, lunch, and dinner, conforming to the usual home requirements of the class of tenants in the house, with one or two extras, is made out by the manager for the succeeding day, and is delivered to each tenant at breakfast. Those dishes or meals which are not required are scratched out, and the bill is returned to the management with wants, complaints, suggestions, or remarks added. The manager then is enabled to arrange for the marketing and also to make out breakfast, lunch, and dinner tables for the cook, showing what each tenant requires, at what hours, and for how many persons. Meals cancelled before the hour for cooking are allowed for, and all extra orders sent down are carried out, so far as possible. All the bills of fare are filed, and at the close of the week the totals are presented and the accounts settled. It was stated that the tariff prices for breakfast, lunch, and dinner do not include butter, cream and sugar, which are charged for absolutely as ordered. Nor do they include tea, coffee, fruit, and other deserts, which the kitchen does not supply at all. All extra dishes or meals not shown on the bill of fare, but called for, are charged at cost price and 10 per cent. extra. Twenty-four hours'

notice is required for large lunch or dinner parties. It will be seen that by this plan Mr. Fisher has been enabled to carry out his purpose; that each tenant of his home club possesses a private and individual dwelling in which he is able to live in such a manner and on such a scale as his habits and tastes and means call for, and with all the elasticity of ordinary home life, free from the publicity of the club, hotel or boarding house, and is at the same time spared the ceaseless worry and annoyances of the private kitchen, while enjoying a much better cooking than is possible to the employers of the ordinary cook. The cost of this system, including the kitchen tax, is, in the case of families of two or three, appreciably less than ordinary living on the same scale, while for families of four to six it is about the same. At the opening of the house last May Mr. Fisher promised his tenants he would hand back any profits of the kitchen, if there were any, on the first of next May, and thus make the kitchen a profit-sharing enterprise. This he did for the double purpose of showing the economy of the system and of inducing the tenants to aid this economy by facilitating in all ways the endeavors of the management to cut down waste. So many of the tenants, though of the best class, have shown themselves indifferent to the difficulties of the management and to the waste, both on their own part and on that of their servants, that Mr. Fisher has given notice that next year this profit, now about seven per cent., will not be shared with them, but will be held to meet the extra trouble and expense of management. As after nine months' trial of this system, with all its initial difficulties, none of the tenants are leaving, and as both the home and the kitchen are satisfactory investments, Mr. Fisher considers that he has introduced a successful though only incomplete method of meeting the domestic difficulties of economic kitchen service.

HISTORIC FIRES.

A LIST OF THE GREAT CONFLAGRATIONS RECORDED IN HISTORY.

Among the great fires of history, undoubtedly the burning of the Serapæum library at Alexandria, in the year 640, by the Caliph Omar I., is most widely mourned, as the destruction of 500,000 volumes cut off much of the record of human knowledge at that time. The general impression of the importance and significance of this fire is, no doubt, augmented in great measure by the alleged answer of this Saracen conqueror, who replied to the protest against the burning with: "If these books are against the Koran, they are pernicious and must be destroyed. If they agree with the Koran, they are redundant and need not be preserved;" and it is not generally remembered that Julius Cæsar burned a larger library of 700,000 volumes at Alexandria, known as the Brucian library, B. C. 48, nearly 700 years before the burning of the Serapæum library by Omer I. At times of sack and pillage, Jerusalem has been burned time and again; the most noted instance being at the siege by the Romans under Titus, during the year 70, when a faction called the Sicarii set the city on fire in many places, and eventually 1,100,000 of the inhabitants perished by fire and the sword. Constantinople has, like all Oriental cities, suffered severely from fires, a large part of such losses being undoubtedly due to the fatalism of the Mohammedans, who bow to their kismet. Said a sultan: "If it be the will of Allah that my favorite city burn, it is the will of Allah." In Dillaway's quaint account of travels in the Levant in 1797, it is stated that the sultan is summoned three times to a fire in Constantinople, and if the fire lasts an hour he is obliged to attend in person and bring mules laden with piasters for the firemen. A great fire at Rome, 12 B. C., caused the Emperor Augustus to take measures for increasing the defence against fire, which had been hitherto in the hands of bodies of police, numbering twenty or thirty, stationed in various portions of the city, and re-enforced at times of fire by companies of volunteers. He appointed new officers with the rank of magistrates, who were entitled to wear magisterial robes. Each was attended by two lictors, and provided with a fire organization of 600 slaves. It is probable that this was not entirely satisfactory in its operation, because six years later another fire caused him to undertake further reforms on a scale characteristic of him who "found the city built of brick and left it with palaces of marble." He increased the fire department to a scale commensurate with the needs of the city. Seven thousand freemen were organized into seven battalions, and one battalion was quartered in every alternate ward of the city. These men made careful inspections of the kitchens, of the heating apparatus, and of the water supply in the houses, and every fire was the subject of judicial examination. The cost of the orgnization was maintained by a tax of 25 per cent. on the sale of slaves. Two notable examples of contagions stopped by conflagrations are the burning of Moscow by the besieging Tartars, in July, 1570, when the plague was stopped, and secondly the fire in London, September 2, 1666, which also stopped the plague, and it has been unknown there since. This London fire is properly called the great fire of modern history, because the reforms which were started in consequence of it are living issues in the municipal affairs to-day. The fire was caused by an overheated baker's oven; and in the course of four days it swept over 436 acres, burning 13,200 houses, 89 churches, and St. Paul's Cathedral, causing a damage estimated to be £10,716,000, say $53,500,000. Under the direction of Pepys, the fire was stopped by blowing up buildings, which was, at the time, the only method of reducing a fire that had grown beyond the capacity of the small fire engines. These were on large tubs, and threw a stream of water directly on the fire, as hose was not invented until ten years later (1672) by Van der Heide. The cities of

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable.*"

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. GOODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

America, on account of the larger amount of wood in their construction and the prevalence of irresponsible methods of building, have suffered severely from fires. The first devastating fire in America was probably the one occurring at Boston, March 20, 1760, when 400 dwellings and stores were burned, causing a loss of £100,000. In the colony of Massachusetts Bay, regulations in regard to construction of chimneys and thatched roofs were made as early as March 16, 1630, and various enactments were made at later dates. The ordinance at the town meeting of Boston, March 14, 1645, made provision that each householder should have ladders long enough to reach to the ridge of his house, and a pole "about 12 feet long, with a good large swob at the end of it;" and various graded penalties were provided for those not conforming to the law. Philadelphia has been remarkably free from conflagrations in comparison with other large cities. It does not appear to have been visited by a great fire until July 9, 1850, when a fire along the Delaware River front, at Vine Street, extending over 18 acres, caused a loss of life estimated as high as 33, in addition to 120 wounded, and a pecuniary loss of $1,500,000. New York was visited by a severe conflagration in the southern part of the city on December 16, 1835, which extended over an area of 40 acres, destroying 674 houses, and causing a loss which has been estimated as high as $30,000,000, on which there was only $8,000,000 insurance—an amount which ruined several insurance companies. One of the first of the more recent conflagrations was the burning of Portland, Me., July 4, 1866. The fire was caused by a boy throwing a firecracker into a cooper's shop, for the avowed purpose of scaring the workmen. In this respect the act was an unparalleled success, the damage being about $10,000,000. The Chicago fire, October 9, 1871, was one of the largest in all history, devastating an area of 3½ square miles, and causing a loss of about $190,000,000, on which insurance was paid to the amount of about $100,000,000. Two hundred and fifty lives were reported lost in this fire. Thirteen mouths later to a day, Boston was visited by a fire which extended over an area of 65 acres, burning the best mercantile buildings in the city, and causing a damage of $75,000,000, on which there was an insurance to over $65,000,000.—*Scientific American.*

That's where *Pearline* goes.

Wherever there's hard work for women, there it's needed. Easy washing goes with it.

Easy washing—better washing. Washing that doesn't wear out the clothes, or hurt the hands or fabric, or tire the washer. Washing that saves money but costs no more than the washing that wastes it.

When it does all this and more, is it any wonder that *Pearline* goes? And it *does* go. It goes to the help of millions of women every day. But there are some who won't be helped. And they're the ones who need it most.

Blowing Peddlers and some grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—but what a puff for Pearline

NAMES FOR DEFINITION.

Mr. Robert Grimshaw, General Editor of the Trades Department of Funk & Wagnalls' Standard Dictionary, being desirous of making as complete as possible his list of mechanical and industrial terms, requests manufacturers of machinery and tools having important parts not found on those of other makers, or the names of which are not yet in general use, to send the name, definition and use of each such part to him at 115 Bible House, New York City.

TO CLEANSE WALL PAPER.—A great many people are interested in knowing how to remove oil marks on wall paper, where careless people have rested their heads. This may be done by making a paste of cold water and pipeclay or fuller's earth, and laying it on the stains without rubbing it in; leave it on all night, and in the morning it can be brushed off, and the spot, unless it be a very old one, will have disappeared If old, renew the application.

REMARKABLE FEAT.—A remarkable feat in the history of the telephone was performed on April 1st. The Paris end of the line which connects that city with London was switched on to the Marseilles wire, and a conversation was carried on with most gratifying results, for the words spoken in London were dirtinctly heard on the shores of the Mediterranean, 800 miles away

TO THIN—"I'll just tell you what it is," remarked a fat, jolly old soul to her companion as the street car rumbled along, "the doctors kin say what they please, but I know it's just flyin' in the face o' natur' to bring a baby up on a bottle. You know Sally Ann Jimson, what lives next door to us?" "Yes," assented the other. "Well, she tried to bring her baby up on milkman's milk, and it died of water on the brain.—*Philadelphia Record.*

INGENIOUS MACHINE.—One of the most ingenious machines recently invented is an automatic apparatus for boring the wooden hubs of wagon wheels and fitting them for the axle boxes. When the wheel is placed in the machine it is automatically centred, the felloe at the same time being trued sideways. The time required for this operation is not more than five seconds. The cutter, a tool revolving at the rate of 5,000 revolutions per minute, is then fed through the hub, the direction and the size being determined by the shape of the box that is to be placed in the opening thus made. When the hole is completely bored the feeding apparatus is automatically thrown out. It is said that the machine is capable of boring about 600 wheels a day.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, April 20, 1891.

The following are the market prices to-day at New York.

	Large Bales.	Small Bales.
Fancy Hay	55c @ 70	60 @ 65
No. 1	60 @	55 @ 60
No. 2	50 @ 55	50 @ 55
No. 3 and Shipping	40 @ 45	40 @ 45
Clover Mixed	45 @ 50	45 @ 50
Clover	40 @ 45	40 @ 45
Long Rye Straw	80 @ 85	45 @ 55
No. 2 "		
Oat Straw	35 @ 40	35 @ 45
Wheat Straw	40 @ 45	

Receipts week ending April 18, as follows:

Via N. Y. Central	144 cars.
" West Shore	105 "
Other roads by Lighter, 34th Street	115 "
Total	364 cars.

The receipts by rail have continued light, but the river barges have brought forward considerable hay, thereby preventing any advance in prices. Common and medium grades are plenty, while prime or fancy hay in large bales is meeting ready sales at 65 to 70 cents.

Perpetual pressed bales of medium and common qualities have accumulated owing to small shipments of cattle, and therefore sales have been forced in order to unload cars, as all roads, except the New York Central and West Shore, are threatening the enforcement of demurage charges.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy, in large bales	$13.50 to $14.50
Hay, choice to fancy, perpetual pressed bales	13.00 to 13.50
Hay, fair to good	11.00 to 12.50
Hay, poor to ordinary	9.00 to 11.00
Hay, Clover and Clover mixed	10.00 to 11.00
Hay, swale	8.00 to 8.50
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	8.00 to

BOSTON, April 18th, 1891.

Receipts for the week are 205 cars of Hay and 6 cars of Straw; corresponding week last year, 192 cars of Hay and 32 cars of Straw. The receipts are not large, and the stocks here are being slowly reduced. The demand for hay is not active. We quote the market steady with an occasional fancy car selling above our outside quotations. Rye straw is firmer; some fancy cars being held at $18. Oat straw very dull.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

Tabasco Pepper Sauce
OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

THE CENTURY DICTIONARY

comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to
THE CENTURY CO., 33 East 17th St, New York.

Be progressive and keep abreast of the times. Avoid dyspepsia by using **Lard Compound** and **Cottolene,** a substitute for lard.

The highest medical authorities pronounce them healthful; and expert cooks commend them.

Our **Clairette** brand of cotton oil soap is the purest and best laundry soap in the market; as pleasant to the hands as genuine castile.

N. K. FAIRBANK & CO.,
CHICAGO AND ST. LOUIS.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

OUR DOMESTIC FOOD SUPPLY.

The advance sheets of the forthcoming April report of the Agricultural Department contain some interesting points in refutation of the assertion that has lately been gaining credence, that this country will not be able to produce food in proportion to the increase of its population. Mr. Dodge, the statistician of the bureau referred to, summarizes his discussion of the subject as follows: "This country has not reached the limit of agricultural production. It has not even approached it. One-third of its area is either too dry or too wet for present cultivation, awaiting irrigation or drainage. Of the other two-thirds there is much not included in farms; its farm area is not all utilized, and the cultivated area may become far more productive. Farm labor is not sufficiently effective; its distribution could be more harmonious and profitable. Prices of cereals have sometimes been reduced by over-supply. Cotton, with a product of 22,000,000 bales in three years—a quantity greater than the production of six years prior to 1860—begins to decline in price. At the same time, there is a failure to produce the sugar required, though there is cane land sufficient for an ample supply, and beet root sugar *ad libitum*, without mentioning the possibilities of sorghum. There might be tens of millions of dollars annually coined from various fibres, large extension of fruit growing, and introduction of many economic plants to be made the basis of new industries. The material now produced for food consumption might be put in more attractive form for market, and a large contribution levied upon the gastronomic and æsthetic tastes of consumers. It is not true that the wheat of the world is declining. It is not difficult to prove the existence of 2,300 million bushels as an average, and there is no prospect of decrease. Annual fluctuations, from climatic causes, will produce variation in price, which the distribution of harvests of different climates through the year and increase of international transportation facilities will help to equalize. The United States will continue to produce a surplus for export, until the wheat culture of the plains shall have given place to more varied and profitable culture, and increasing numbers of non agricultural population shall require for bread the entire crop. It is proper to say that the tendency is towards a better distribution of crops, and to higher prices and greater profits. The proportion of agricultural labor will decrease, non-agricultural will increase, agricultural production will be more varied, rural intelligence and skill will advance, and the farmer be in better position to demand and secure an equitable share in the net proceeds of national industries."

ELECTRIC BASE-BALL.

The Boston genius who proposes to introduce electricity into the Great National Game of base-ball must be oblivious of the fact that he is striking at one of the most cherished features of that cheerful and perilous amusement. Electricity is used for almost everything, but we doubt whether it will ever be used in base-ball. The Boston innovator in question proposes to place electric buttons at each base, which, on being pressed by the foot of the player, will record that fact at some convenient place on the grounds, and in this way show conclusively whether the runner was "out" or "not out." But to reduce this question to an electric certainty would destroy some of the most interesting features of the game. There is no finer sight on the American ball ground than an umpire in the act of interviewing a baseman who claims that he is "out." To see him brush the sand off his clothes, angrily gesticulate, and excitedly argue the point with the other players, always throws the bystanders into tumultuous raptures. But incidents like this would disappear with the electric button; there would be no chance for dispute. Besides, the umpire, who is now one of the most interesting figures in the game, would sink into comparative obscurity. His decisions of the subtle question which the Boston man proposes to decide by electricity give rise to some of the most exciting features of the game. They excite the derisive jeers and howls of the crowd in shirt sleeves that add an interest to base-ball which its lovers would not like to miss. The Boston man's device, it is certain, would not be popular with most ball crowds.

TIN FROM SILK.

With the development of our native tin mines, and the increasing expansion of the tin plate industry in the country comes information of a new field of enterprise in that direction. An ingenious Frenchman, according to our foreign exchanges, has discovered a process of recovering the tin contained in the wash-waters of silk which have been weighted, and has accordingly received from the French Society for the Encouragement of National Industry the prize allotted for the utilization of residual substances. As it is estimated that Lyons alone will effect an annual economy of $60,000 by these means, the gentleman deserves his reward. But the history of the reclamation of waste products, although it has been full of surprises, and may be considered an amazing testimony to the genius and patience of man, contains nothing more remarkable than this profit derived from the refuse of this excessive adulterant. The question has been more than once asked why silk rags had no value, but they may yet be sought after, not for the sake of silk, but of tin, and if we had an industrial mint we might complicate the contingency of an old silk gown, split and torn because it was as much metal as textile, being converted into a dripping pan or some other kitchen utensils.

WOMEN COLLEGIATES.

The statement is frequently made as a reproach upon women that they do very little to assist in the education of women. Their money, when they have any to bestow, goes to endow men's colleges, while those founded for their own sex struggle along with little assistance. This reproach, if ever it was just, is hardly so at the present day. The Massachusetts Society for the University Education of Women is raising by subscription, mostly among women who are not themselves long out of college and whose means are limited, about $7,000 a year to help poor girls at Boston University and at Harvard Annex. The Vassar Students' Aid Society, composed of former students of Vassar, is supporting five scholarships for girls without means desiring an education at that college, and now the Association of Collegiate Alumnæ, which includes graduates of sixteen of the best colleges in the country open to young women, is offering two fellowships, one of $500 a year for post-graduate study in a European university, and another at $350 a year for post graduate study in an American college. The time is coming when, through the efforts of the women who have themselves been "personally conducted" through the so-called higher education, it will be as easy for a poor girl to

get free tuition as it now is for a young man. The European fellowship of the alumnæ is to be awarded for the second time this coming June.

CAUSE OF THE GRIP.

Dr. Henry B. Baker, ex-President of the American Health Association, has informed his colleagues of the Michigan Health Board that he has discovered the cause of the grip. He says that the germs of influenza are generally at all times present, but there must be certain coincident meteorological conditions to irritate the throat and air passages sufficiently to let the germ gain an entrance to the body. These meteorological conditions in this instance were the excessive prevalence of north and northeast winds and the excessive amount of ozone during the last three months.

BRITISH DOMESTICS.

HOW THE BRITISH HOUSEHOLD IS SERVED.

Mr. E. L. Wakeman, writing from London, under date of March 24, to the *Sun*, has this to say of the servant question in Great Britain: "There is in Great Britain a line of nobility, not set down in Burke's Peerage, as rigorous in distinctions, as unyielding in established rights and traditions, as impregnable against innovation, and as haughty in the enjoyment of its caste and privileges as that authenticated nobility and aristocracy which its different ranks as often rule as serve. These are the lords and ladies of that vast and ordinarily mysterious realm known as the "below stairs" of British life. They are one and the same in England, Scotland, and Ireland. While British politics may boil in Ireland, stew in Wales and Scotland, and simmer in England, the real United Kingdom, imperturbable to politics, calm and impassive in the face of commercial disaster or social change, is held together as with ribs of steel, rivets of copper, and cappings of brass, by the adamantine solidarity of this invincible nobility—the British dames of the duster, ladies of lapdog and luggage, lords of the ladle, barons of bells and boots, and peers of the pantries and pots. As a result of several years' observation, I should say that the chief characteristic of the British servant, whom we may fairly call the English servant, is a never-failing consciousness, and insistance upon the cognizance by all others, of his, or her, exact place, whatever the place may be. Because of this, much else may be condoned. There is only one other class of servants in the world that gains so much through the same characteristic in a certain degree of dignity. This is the African. However much you may "elevate" and educate the latter, place them in any form of service and the old consciousness of propriety in distinctions instantly returns, and with it the fine, though often pathetic dignity of themselves asserting the distinction. The true man or woman of service possesses a real, if sometimes sombre pride in serving a real gentleman or real gentlelady; and while you may not find the African's amiability in any apparent unconscious defining of relations in your English servant, it is the one unvarying rule of feeling, thought, and action of his or her whole life to truly serve the truly noble and considerate, and to truly rule, by endless insistance of rights, perquisites, and traditional dignities, the ignoble and the parvenu. The number, wages, and ways of the servants employed in and about the great halls, seats and castles of Britain almost tell the story of their masters. First and foremost is the stewart, who is responsible to milord and lady for the entire establishment, the servants, hiring of servants, and the purchase of all ordinary necessities, such as food, except meats, which is invariably the perquisite of the cook. The steward receives £80, and an unlimited amount of noble blackguarding, per year. Next in importance, if not indeed the first, is the housekeeper. She is usually a maiden lady of severe age, or a widow culled from poor relations. She must be a person of infinite expediency, common sense, experience, and with a soul and physique of iron. She usually has entire charge of the detail of all domestic matters; holds the keys to every private apartment and secret compartment; with her assistants makes, lays, and repairs all carpets; cleans and rehangs all tapestries; frequently originally embroiders the finest of draperies; packs, unpacks, rehangs and drapes all paintings; prepares and marks with the family crest all linen and laces; cares for the statuary, and attends to the interminable cleaning and waxing of floors. She receives from £20 to £25 per year, having under her from one to two assistant housekeepers, whose yearly wages are from £12 to £16. In a general way, all the female members of the place are amenable to the head housekeeper, who is at no time away from her post. The next of these in grade is perhaps this governess. The necessary though unfortunate person is expected to educate and form the manners and morals to the age of twelve of the children. She must read, write, speak, and teach French and German, and be able to instruct in the rudiments of Latin, the sciences, and philosophy. She must sing, and teach vocal music, and play and instruct upon the piano and harp. In fact, she must be the superior, companion and servant of her charges. Her compensation is £40 to £60 per annum, and many opportunities for intrigue. In the greatest houses she is allowed two, and sometimes three nursery maids, at from £10 to £16 each. There is an upper housemaid at £16, an under housemaid at £12, and from two to four assistant housemaids, at £10, all really under control of the housekeeper. But the ladies' maids, who are responsible only to their mistresses, hold what are regarded as the most desirable positions; insomuch as, while the most exacting duties are required, they receive from £30 to £50 a year, while their opportunities for travel and sightseeing are unlimited. The lady's maid is usually a young woman of excellent education and genuine accomplishments, and of extraordinary patience and finesse. To follow her in one day's duties would assure any one of all that. Her breakfast must be taken while milady is still sleeping, for when she wakens her cup of cocoa must be ready, after which the bath is given and milady's hair and toilet "done." While the latter is at breakfast her chamber must be righted and aired and the morning dresses arranged. If her ladyship goes for a drive or ride she must be again dressed for the same; and while she is absent, the maid, who in most cases, is a thorough modiste, must busy her fingers at sewing. It is not customary to give her new cloths to cut, but she must be competent in all repairing and even in cleaning and re-making a soiled costume. She lunches at the same hour with her mistress, but hurridly, for, if in the city, she must during this time attend to necessary shopping. After lunch hour her ladyship is dressed for going out or for receiving at home. Then again comes the round of sewing, or mending, getting out her ladyship's dinner gown, etc., and assorting and polishing her jewels for possible evening wear. Then her mistress must be dressed for dinner, and after her own dinner is eaten, the evening costume complete must be laid out, some finery removed and bits of fresh lace added here and there; when she is prepared to fold, seal, and post such letters as her ladyship may have written just after dinner, by which hour the ordeal of placing her titled ward in full evening costume is at hand. This passed, the maid may busy herself getting costumes for the morrow in order, perhaps steal out for a half hour with the ladies' maids coterie; but woe be to her if she is not smilingly in waiting, on her ladyship's return, with the latter's chamber in perfect order for retiring, at which she assists, and then lies down like the faithful animal she is, in a room next her mistress, within call of bell, which is liable to summon her at any hour of the night, or, rather, the morning. All lower female servants hold the lady's maid in deadly hatred, the while longing for her place as one almost possessing the honors of royalty itself. The female servants also comprise a head laundress at £30 and two or three assistants at £12 each per year; an assistant cook, who must be equal in ability to the *chef*, and receives £20; two additional assistant cooks, or kitchen maids, at £14, and two scullery maids at £12. The head butler is a sort of generalissimo of the male servants of the household. A majestic bearing is a fortune to this fellow. He is the general-stand-around-and-look-awful of the house; but must have an eye to the welfare of guests and the character and behavior of his inferiors. He is also the head waiter. He attends to the table and its proper setting and service at all times; presiding at the carving and other mysteries of the sideboard; for all of which he receives £75 per year. The under butler, at £35, has entire charge of the silver. It practically never leaves his hands or sight, as he not only delivers to, and receives from, the hands of the butler all pieces used, but washes, polishes, and sleeps alongside their receptacle cases in the pantry. During seasons of unusual entertainment, he also assists the head butler at meals. There are generally also first, second, and third footmen. These receive about the same wages as the under butler. They clean milord's clothing, which a valet scorns to do save when his master travels, assist at meals as waiters, wash glass and silverware, are regarded as general help under the butlers; and are, properly speaking, only footmen when on duty as such with the carriages. Among the other male servants is milord's valet, with well-known duties. A bright one receives £70 per year, and will easily manage to secure as much more. Then there is the head cooks, to none of whom are paid one-fourth the price given by the American nouveau-riches to their recently imported chefs, who receive from £125 to £150, with perquisites of about £50 from the sale of drippings and and fats. There is also a head coachman, at £60 to £80, under whom are a second coachman at £25, a stud groom at £20, and grooms, stablemen, and helpers at from £10 to £20 each; and one or two "odd men," who attend the servants' hall, carry baggage, clean boots, and are a sort of everybodys' men to all below stairs. The whole number of servants at one of these princely houses is therefore very large. I have only enumerated those directly serving the household itself, whose members may not number a half dozen, and in seasons of entertainment will not average more than two dozen souls. Among all these house servants there are what might be called an upper and a lower house. Precedence is as severe a master and scourge here as with the nobility themselves. The hours for servants' meals are: Breakfast, 8; lunch, 11; dinner, 1; tea, 5; and supper from 9 to 10. The upper house includes the steward, butler, housekeeper, the head cook, the valets, and the ladies' maids. These usually take all their meals by themselves, in either the steward's or housekeeper's room, where they occasionally lounge and do their necessary correspondence. The lower house comprises all other servants, of whom the under butler or assistant cook takes precedence. In some houses all the servants dine together, the upper servants assembling in the housekeeper's room, from which they solemnly march to the servants' dining hall, the lower servants remaining standing until their betters are seated, the butler at the head of the table. No conversation whatever is permitted while the joint is being partaken of. The lugubrious silence and austerity of this gathering are inconceivably ludicrous. When the meat course is finished the upper servants rise. The lower servants follow with military alacrity. The former, in their proper order of precedence, like automatic puppets, then march back into the steward's room, where, in the greatest punctillo, pudding and dessert are served. Meanwhile the lower servants, relieved of the presence of these, their severest masters, fall to small talk, cheese and small beer to their hearts' content. Other grotesque forms among these folk are noticeable. Guests' servants invariably take the rank of their visiting master or mistress. The valet of a lord is seated next the

butler, and is often housed and "entertained" by the steward. The maid of a countess or duchess is "handed in to dinner" below stairs with all the ceremony which her titled mistress may receive one story higher. But an ordinary servant or footman must accept rigorous "pot luck" with members of the lower house. Again, the upper servants must always be addressed by the lower as "Mr.," "Mrs." or "Miss." But among footmen and housemaids in general dignity often gives way to alacrity, which, in turn, imposes the highest honors. For instance, above the clamor of morning bells will be heard such startling exclamations as "Dunraven, there's yer man's bell!" "Marlborough, be lively now!" "Manchester, yer ol' boy's moving!" or "Tweedmouth, yer valley wants ter groom ye!" Besides the thirty to forty servants employed about the household and stables, the larger establishments require an equal number out of doors in various capacities. First, there is the "agent," who has general charge of the estate, indeed often the entire control of the property. Frequently with him are a half dozen accountants and clerks. The next man below him is the bailiff. His province is to look after the home farm and cattle. This is no sinecure, for on some of the greatest estates farming and grazing are conducted on a large scale, and this entirely exclusive of the fancy farming and gardening, in which nearly every one of the nobility indulges. Sometimes, enclosed by the inner walls surrounding the hall itself, though oftener at some little distance away in well-ordered arrangement, will be found outbuildings, graneries, machinery, storage houses, mill houses where grain is threshed, logs are sawed and feed is ground by steam, and covered enclosures for young stock, in number and capaciousness quite surprising even to one accustomed to the provision for the same by the most noted American farmers. A host of hangers-on find lazy employment here. Then upon a demesne of several thousand acres there will be a head gamekeeper, who will be allowed a dozen men to assist him in breeding and caring for the game and in protecting it from the inroads of poachers. Some of the finest forests in the world are upon these estates. Each requires a head forester, with half a dozen men under him. New trees are being planted constantly. Too heavy growths are thinned out. Every sound tree trunk is sold to be cut in deals; every unsound one finds ready sale for fuel. If a river runs through a demesne several men are required for constantly beautifying its banks and keeping the poachers away from its fish. The roads and driveways of a fine demesne require very great attention. Then there is a master sawyer and his men for cutting posts, for repairing gates and fences There are painters, glaziers, carpenters, a number of whom are kept in service, and busy the year round. The head gardener requires several assistants. And, if a guest, your coachman's call of "Gate! gate!" will, in a ride about an ordinary estate, bring to the lodge gates at different entrances fully a half dozen bronzed old lodge-keepers from out of flower-embedded, ivy-covered lodges. Every one of these is an army "pensioner;" heroes bold, at their British army pension and £10 a year, whose lives fade out here in these shadowy nooks among the hares and pheasants with perhaps one gate call and a pot of beer a day to keep their scattering, useless wits together. In England servants are precisely what ten centuries of masters have wished them to be. English servants, in America, are miserable beings, giving the worst of service. They are outside of England; they have lost the pose and poise of their rock-rooted home regime, while they are bewildered by the eccentricities of many of our amateur nobility who import them, who will require some little time to accustom themselves to the attentions of any manner of servants.

EDGAR L. WAKEMAN.

ELECTRIC HEAT.—It is found that the "sparkling," visible when switches are turned on or off—to say nothing of that seen at dynamo brushes—will ignite the ordinary vapor given off by petroleum.

BICYCLE SCIENCE.

WHAT KEEPS THE WHEEL AND RIDER UPRIGHT?

Dr. Charles B. Warring, in a paper published in the *Popular Science Monthly*, says, in relation to the bicycle, that there is something weird, almost uncanny, in the noiseless rush of the 'cyclist as he comes into view, passes by, and disappears. We involuntarily ask, How is it possible for one, supported on so narrow a base, to keep his seat so securely, and seemingly so without effort? For an answer to this question I have searched somewhat widely, and while I have found articles on or about the bicycle, and what has been done by its riders, I have found none that offered a reasonable theory for its explanation. The only paper I found that claimed to explain the bicycle was one by Mr. C. Vernon Boys, delivered before a meeting of mechanical engineers and reported in "Nature," vol. xxix., page 478. Mr. Boys attempted to illustrate his subject by spinning a top. "The top revolves on its axis and it stays up; the wheel of the bicycle revolves on its axis and, therefore, it stays up," was the sum of his theory and demonstration. Of all machines none seem to be so little understood as the top and its near relation the gyroscope; but without going into the theory of their stability in motion, it is easy to show experimentally that their stability and that of the bicycle must be due to different principles. I spin on the table before you a top with a somewhat blunt point. You notice it runs around in a circular or rather a spiral path, and gradually rises to a perpendicular. I strike it quite a hard blow but do not upset it. I send it flying across the table or off to the floor, but still it maintains its upright position. You notice that when it is perpendicular it stands still; but if it leans ever so little it immediately begins to swing or gyrate around a vertical axis. I now change the top for one whose point is very fine, and well centred and sharp. You see it hardly travels at all. I now cause the point to fall into a slight pit in the surface of the table; it ceases to travel, but continues for a considerable time to swing around a vertical axis, and is remarkably stable whatever the angle at which it leans. Stopping its travelling has no effect upon its stability, but now I put my pencil before the axis and stop the gyration or swinging around. Immediately the power of staying up is gone, and the top falls. I may vary the experiment in every possible way; so long as the axis is inclined the result is the same—the moment the gyration ceases the top falls. In the case of the bicycle there is no gyrating around a vertical axis; yet gyration is absolutely essential to the effect which Mr. Boys thinks accounts for its stability. The gyroscope, or rather that form of it which Sir William Thompson calls a gyrostat, revolves around a vertical axis. If it leans a little it revolves slowly; if it leans much, it revolves faster. It will not fall to the table, though I push or strike it a hard blow. I now take it by the projecting wires and attempt to make it move in a straight course, as a bicycle does when it spins along the road; instantly it falls. We may then, I think, dismiss the top and gyroscope from further consideration. Others find in its going so fast the reason that the bicycle does not fall, but two forces acting at right angles to each other do not interfere. Now, in the case of a bicyclist, his forward motion is at right angles to gravity, hence does not in any way resist it; and, therefore, as it is gravity which causes him to tilt over on the side towards which he is leaning, the forward movement will not prevent his falling. Many think they find the counteracting influence in centrifugal force; but centrifugal force is impossible as long as the body moves in a straight line. So long as the bicyclist does not turn corners centrifugal force gives no assistance whatever; yet it may be thought that this force, if supplemented by skilful balancing, is sufficient. If the stability were due to balancing, it would not be difficult for a bicyclist to sit on his machine when not in motion. The ordinary bicyclist cannot do this, and yet, without apparent effort, he rides securely. That his stability is not due to his balancing and rapid forward motion combined, is evident, when we reflect that if the handles are made immovable, so that neither of the wheels can be turned to the right or left, it is impossible for any rider to keep from falling after he once begins to tilt. Some other explanation is needed; this I shall now attempt to give. Regarded mathematically as a machine for the application of force, the bicycle is a very simple affair. The weight is applied at the saddle, and is so great that the centre of gravity of the whole is very close to that point. The lines of force pass from the saddle to the points at which the two wheels touch the ground, and as a vertical line from the saddle falls between these two points, it is evident that the bicycle can neither tip forward nor backward; but in regard to side motion its equilibrium is very unstable, the least thing will upset it. Stability is secured by turning the wheel to the right or left, whichever way the leaning is, and thus keeping the point of support under the rider. Let us suppose a 'cyclist mounted on his wheel and riding towards the north. He finds himself beginning to tilt towards his right. He is now going not only north but east also. He turns the wheel eastward; the point of support must of necessity travel in the plane of the wheel, hence it at once begins to go eastward, and as it travels much faster it quickly gets under him, and the machine is again upright. Hence it is easy to understand that the faster the machine is travelling the easier it is to keep from falling. As regards headers, the higher the saddle the greater the danger, and the farther back the less the danger. The law of lateral safety—*i. e.*, against falling sidewise—is in one respect the reverse of the other, for the greater the height of the saddle the easier not to fall to either side, just as it is easier to keep upright on my finger a long stick than a short one.

VERY DEAR.—The most expensive drug known is physostigmine, two ounces of which cost nearly $2,000,000. It is a preparation from the calabar bean and is of use in eye diseases.

TRY IT.—Write down your age in years, double it, add to the product obtained the number 3738, take one-half of the sum, add 22 and deduct your age. The answer will invariably be the number of the current year. —*Arithmeticus.*

WOMEN WORKERS.—In Germany 5,500,000 women earn their living by industrial pursuits; in England, 4,000,000; in France, 3,750,000; in Austria Hungary about the same; and in America, including all occupations, over 2,7000,000.

IRON OR STEEL.—To ascertain whether an article is made of steel or iron pour on the object to be tested a drop of nitric acid 1.2 specific gravity, and after it has acted for one minute rinse with water. If iron, the spot will be of a whitish-gray color; if steel, it will appear as a black stain.

MIGHTY SHIP.—One of the latest additions to the British navy is the Blenheim, a protected cruiser of 9,000 tons displacement. Of this weight 4,000 tons are used for the protecting plates, armament, equipment, and coal. She is 375 feet long, 65 feet beam, 20,000 horse-power, and 22 knots speed. She is considered to be the largest, fastest, and most powerful war ship in the world.

BOLTLESS WHEEL.—In Europe steel-tired wheels for railroad cars are used more generally than in the United States. The difficulty here has been to secure a tire that can be placed in position without bolts. This obstacle has been overcome recently by the invention of a wheel that not only does away with bolts, but, at the same time, admits a steel tire that will wear much thinner than those ordinarily in use. This result is obtained by means of a peculiar fastener, which consists of a notched plate that is placed between the tire and the wheel. The alternate projections on the plate are then bent into a groove in the tire while the other projections are bent around the edge of the rim of the wheel. The tire is thus made perfectly stable, and it can be worn much thinner when thus fixed in position than by the old process of employing a simple flange for the same purpose.

A PITEOUS PLEA.

UGLY GIRLS DISCUSSED BY ONE OF THEMSELVES.

It does not matter much to a boy, whether he is good-looking or the reverse. He is not obliged to wait for somebody to ask him to dance, and his matrimonial prospects don't appear to suffer any serious discount from personal shortages that would send a girl's stock away down below par, or even put her out of the market altogether. One never sees a man so hideous or repulsive but that some woman is ready to marry him if he only will ask her; but men are less philanthropic, and so the ugly girls are left to run to waste as unappropriated blessings. The "handsome is as handsome does" theory wont hold at all after we get out of the nursery, and a little experience soon convinces us that it is a fraud and a delusion, like that other domestic fiction about the drumstick being the choicest part of of the fowl, with which our elders used to impose upon our unexpected simplicity. We ugly girls never get any ride in the Park, nor free seats at the theatre; and as for ice-cream and French candy, no matter how handsomely we deport ourselves, we shouldn't know the taste of either if we waited to have it bestowed upon us. Indeed, the expensiveness of being an ugly girl is one of the worst things about it. There are no perquisites. We get none of the plums out of life's pudding, for under present conditions men do all the carving, and, as one of them says, "All the fine things we think and say about women apply to those only who are tolerably good-looking or graceful." Now suppose the same rule applied to men, and that only the good-looking ones could hope to attain to wealth and distinction; suppose, for instance, that that famous wart on Oliver Cromwell's nose had been sufficient to condemn him to obscurity, as it inevitably would have done had he been a woman; suppose Grover Cleveland's too ample girth of waist had kept him out of the White House, as it certainly would have kept Mrs. Cleveland out, had she been the unlucky possessor of that inconvenient superfluity; or suppose David B. Hill's bald pate had rendered him ineligible to the office of Governor of New York, as I have not the shadow of a doubt that a bald head would render any women in America ineligible to the office of Governor's wife; suppose, in fact, that a bald head was sufficient to blast any man's prospects in life, as effectually as it would any woman's; I think most of the middle aged men, at least, into whose hands this paper may fall, will admit that that would be a little hard. Yet this is the law under which women have lived, since the beginning of time, and it doesn't give the ugly girls a fair chance. It is very possible for a man to be so hideous that a woman would not marry him (which, of course, it isn't), there are still dozens of careers open to him, in which a red nose or an apoplectic chin needn't stand in his way; but the ugly girl has no such resources. No matter how clever or amiable we may be (and some of us are really very adorable creatures, although you might not think so, to look at us), we cannot do anything but stand aside and see all the big matrimonial plums fall into the laps of our fairer sisters, while only the sour and wormy ones are left for us, and few even of them. Not only are we debarred forever from the glorious privilege of becoming known to fame as the spouse of some one of the army of statesmen, whose genius is making American legislation the wonder of the world, but we cannot even hope to deserve an eight-dollar pension from our country by becoming somebody's widow, which seems to be about the only service which can entitle woman to the gratitude of her country. In short, the ugly girl seems to have no rights which sociery is bound to respect. Now, we ugly girls think all this very unfair. We don't ask the men to marry us, nor hope to earn our country's gratitude by becoming widows, but let some modest standard, which one can hope to attain, be recognized. At all events, give us a respectable career of some sort. We have been allowed a few gleanings from the Tree of Knowledge, but the Tree of Life still stands in the midst of the garden with its fruit forbidden to us.—*April Lippincott's.*

CHEAPNESS NOT THE TRUE END.

PAY A REASONABLE PRICE FOR THE BEST YOU CAN AFFORD.

Men have their bad points, no doubt. We never studied them. But they certainly have one characteristic trait worthy to be commended and copied. I refer to the way they make purchases. Every one knows how women buy, and that no woman under the sun is ever satisfied with anything less than a "bargain." I really think this bargain hunting has produced a spirit of gambling and that women are responsible for the disgusting variety and outrageous number of shoddy goods, glass diamonds, pinchbeck ornaments and vulgar imitations and flaring cheats of all sorts that are placed upon the market to day. They have created a demand for bargains, and it is impossible to conceive of the manufactories turning out anything more absurd and unneeded than we already have. To a woman, a bargain means the purchase of something for half its price, or less. What is this but gambling? If the article is up to the standard, it must be worth a certain price; and if less is paid for it, either the thing itself is a cheat, or some one has lost by the transaction. Bargains are deleterious in another way; they cause, by their delusive cheapness, a careless and reckless expenditure and engender a spirit of dishonesty. This is the tendency, with an ever-increasing greed for more and greater bargains. Nearly all women agree that men are extravagant. Men will pay $7 for shoes, when $3 will buy a pair which "look just as well;" $5 for a hat, when a woman can "bunch up" her best Sunday hat for a dollar or two; and as for a man's clothes—why, one suit costs as much as a woman's three best dresses, bonnets thrown in. This does sound extravagant when you apply the "deadly parallel" to it; but if there is one thing I admire about a man, it is the decent and self-respecting price he pays for things. A woman goes out to buy a pair of shoes: she fritters away a whole day buying bargains which could not be resisted, and comes home loaded with them. But the shoes? Oh, yes, she has the shoes—bargains, also, of course. "Regular four-dollar boots," she will explain, with an accent of proud certainty. Then she exhibits her bargain laces, and her Summer goods bought in Winter, and stows them away with a smile of satisfaction, just as though there would come ere long a bargain famine. Again, she congratulates herself as she thrusts her dainty foot into the bargain boot. But see the result: the pretty looking shoes have lost their shape with a few wearings, and are beyond recognition in about half the time that the genuine four-dollar boots would have lasted. Then, when the young Summer has come, and every breeze which stirs the small green leaves suggests laces and draperies and all kinds of dainty, filmy, fluttering things, the other bargains are brought out. But they look so different now! They are out of style, or the windows are now full of newer, cheaper and prettier articles; and altogether she wishes she did not have them, and wonders why she ever bought them. I have seen well-to-do families of whom not a member ever appeared well dressed except the husband and father, and the reason was obvious—he bought his own clothes and eschewed bargains. I am glad that men stand their ground in this matter, and scorn a bargain counter; otherwise our homes might be hollow, and rickety, and cracked, and unreal, and cheap. The fact is, men become disgusted with so many bargains, from the half-price toilet soap to the wife's tawdry jewelry; and so when they go to buy, they simply ask for the worth of their money, and are willing to take somebody's word for it besides. When will women learn that it is always economy to buy the best? It lasts longer, is in better taste, and is in every way more satisfactory. It is childish to buy things just because they look well; children prefer tinsel to gold if it glitters more, but women are supposed to have put away such infantile ideas. I trust that the day is not far distant when our women will realize that it lessens their dignity and self-respect to wear imitations, just because they happen to be a freak of fashion and cheap. It is essentially vulgar. The craze for bargains, moreover, is dishonest in principle, and children brought up in such an atmosphere cannot have true conceptions of taste or appreciation for the best things. "'Tis true, 'tis pity, and pity 'tis *'tis* true"—that they will be compelled to learn better of their fathers. This is the safest rule: Buy the best you can afford, paying a good, decent, reasonable price, and then take the best care of it. For this is the secret of economy, after all—not what you make or pay, but what you save and take care of. —*Kate Field's Washington.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounders, halibut, herring, lobsters, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, white-fish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

SPRING SOUP.—Make some good broth from a mutton bone, cooked down with pepper, salt and two or three celery stalks. Take a pint and a half of this, strain it and add two tablespoonfuls of flour rubbed smooth in a little milk, a well beaten egg and a teacupful of milk, also more salt and pepper if it is needed. Cook these ingredients in the broth for a moment, then add a small cupful of finely chopped parsley, two teaspoonfuls of chopped mint and a few very thin slices of lemon. Serve very hot.

POTATO CURRY.—Cut some raw potatoes into dice and sprinkle them freely with curry powder; have some butter melted in a frying pan, put the potatoes into this and toss them about until half cooked, then pour over them some gravy or soup and stew until tender. Serve very hot.

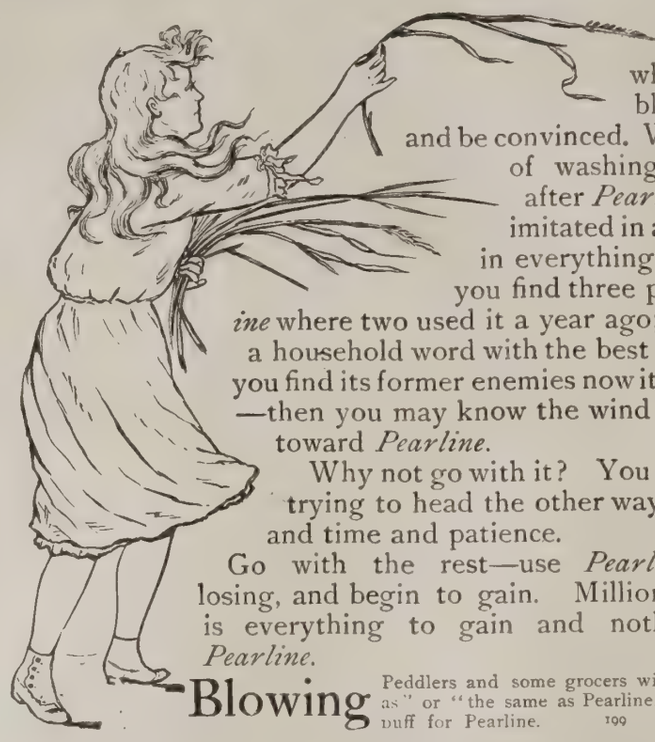
MUSHROOM TOAST.—Skin and clean some fresh mushrooms and stew them with a good lump of butter, three cloves, pepper and salt, a small onion and a small bunch of parsley and summer savory, and three teaspoonfuls of lemon juice, dust a little flour over them and add a very little water; when they are cooked nearly dry add a teacupful of veal gravy or cream, and cook eight or ten minutes longer. Make some thin slices of toast and butter them, lay them on a platter; thicken the mushroom sauce with one or two eggs and pour it over the toast.

OYSTER PATTIES.—Remove the tough part from twenty-five small oysters. Chop up one-half cup of mushrooms and one-quarter cup cooked brains. Put two teaspoonfuls of butter in a sauce pan, and when it is melted add a tablespoonful of flour, cook for a few

minutes stirring constantly; add one-half cup of cream and one-half cup chicken broth or good white stock, or if more convenient use a cupful of cream instead of the broth or stock. Cook this, stirring constantly until it is smooth and free from lumps, then add to it the mushrooms, brains, and oysters, season with salt and pepper. Have ready some puff paste patty-shells, make them very hot then fill with the mixture, set them in the oven for a moment then serve.

DEVILED ALMONDS.—Blanch and dry some Jordan almonds and fry them until they are nicely browned in butter, then put them into a sieve and sprinkle them with a mixture of two-thirds cayenne pepper and one-third salt, shake them about so that they get an even amount of the seasonings. They may be eaten hot.

TO BLANCH NUTS.—Put some water over the fire in a sauce pan with a pinch of salt. When it boils throw in the shelled nuts, let them remain a little more than a minute then put them in a sieve, pour cold water on them and slip the loose skins off.



LEFT OVER SPINACH.—Take the cold spinach and if there are any slices of egg left over use them also, if not add a hard boiled egg; chop the egg and spinach well together and fry them for a few minutes in butter. Serve very hot, add seasoning of salt and pepper if needed.

DINERS AND DINING.

HOW TO PROMOTE DIGESTION AND PROLONG LIFE.

It has been said recently that Gladstone, the English statesman, lays stress upon his habits of eating as one secret of his extraordinary vitality, and capacity for hard work at a time of life when most men, fortunate enough to be still in the flesh, are thinking of nothing but their ailments. Mr. Gladstone confided to an interviewer that not only what he ate but how he ate was of vast importance to his comfort and health. He loved good living, but he had so trained his taste that food which experience had taught him was hurtful became positively distasteful to him. He was not fond of gastronomic experiments. He held fast to the dishes he knew—good roast beef and mutton, bread and potatoes, with a mug of ale or some light claret. He wanted no highly spiced food, no pastries, no elaborate menus requiring foreign cooks for their preparation. Next to simplicity in food the greatest Englishman of his day believes in thorough mastication, saying that he chews every mouthful with systematic thoroughness. He made long ago some experiments in "bolting" one meal and then masticating the next properly, the results showing that the immediate effects of hasty eating, to say nothing of permanent injury to the stomach, were quite remarkable. One hour after a bolted meal, even of the best material—say roast beef, baked potatoes, bread and ale—the mind refused to work without urging; the body was uneasy, and remained so for hours; small difficulties were magnified, and all the symptoms of dyspepsia in a mild form were present. On the other hand, Mr. Gladstone found that the same dinner properly eaten, with due deliberation and much mastication, produced exactly opposite results; an hour after the meal any kind of work was a pleasure. In the same fashion he experimented with various kinds of food, arriving at the conclusion that food is less responsible for a disordered stomach than the manner in which it is eaten. He noted minutely the effect of a simple dinner well eaten, and then of a rich dinner of improper food equally well eaten. There was bodily discomfort and mental inertia after the improper food properly eaten, but in no such degree as was noted when proper food was "bolted." As to bolting improper food, Mr. Gladstone had too much consideration for his stomach to put it to such a test. It is notorious that much more depends on how we eat than most people imagine. Simple food, and the practice of chewing each mouthful forty times, as Mr. Gladstone is said to do, may not make Gladstones of us all, but it may enable us to do our daily work with less labor, and tinge with content the dreariest of outlooks. The French are said to be the light-hearted people of Europe—the gay French, they are called—and the elastic fashion in which they recovered from the Franco-German War was the wonder and admiration of the world. Perhaps the care given to cooking and eating had much to do with it. I once knew an old French lady who, at the end of her first boarding-house dinner in this New World, burst into tears with the remark that an existence of dinners without soup, wine or coffee was not worth living. She could not understand that people could either work or play properly when dinner was thus shorn of its best features. It sounds trite to say that the simplest meal can be made gastronomically effective by intelligent taste and care. In any manufacturing establishment the boiler room is the object of the utmost care; the fuel, the manner in which it is used, are matters of importance, for upon the fires depend the power to which the whole building looks for effective work. Food is our fuel, and the stomach is the furnace in which we use it. How long would a boiler do its work if fed with the same haphazard recklessness we show in maintaining the human fire? It was the excellent Dr. Kitchener, the author of the "The Cook's Oracle," who first declared that none but a hungry waiter could appreciate the importance of having the plates warm and the wine cool. Little niceties of dining are apt to be regarded with absolute indifference by a man who has dined well and feels that he never cares to dine again. The hungry waiter will feel for the hungry man whom he serves. Upon the other hand, I have heard it argued that only the man who has dined can serve a dinner with proper repose. The hungry waiter may be excited by the good things before him to hurry the meal in an unseemly fashion, and hurry, or the semblance of hurry, is fatal to a dinner. A waiter who whisks on and off the courses is a sinner against gastronomic law; everything pertaining to dinner should be done as if time was made for dining. According to an old gentleman with a face reddened by the fires of many kitchens, with civilization in New York came the French cooks, or, as he would probably put it, with the French cooks came civilization. When, therefore, it is considered that this country has nearly 600 cooks who are members of the Société Culinare, volumes are spoken for the civilization of the country. The Société is organized to maintain an esprit de corps among its members. A chef is not allowed to do certain things. For instance, he must refuse to sacrifice his art to any such consideration as economy. If some great light of the profession has invented a dish requiring 20 dozen yolks of eggs, his colleague must not attempt to concoct the same dish with 19 dozen, and thereby risk spoiling the other master's reputation. One of our famous club chefs who refused to do this sort of thing and threw up his situation, was voted a medal by the Société and had a new kind of tart named after him. The gentleman in question was inclined to attribute the degeneration of cooking from the days of Brillat-Savérin to the fact that the great hotels of Europe and this country now pay the salaries which attract the lights of the profession, and yet economy must be studied in cooking for a hotel. The cook loses tone when he has to study economy. We have heard a great deal of recent years of the enormous sums paid by American millionaires for their cooks; the generation seems to be in danger of forgetting that it takes more than money to make a perfect meal. That some of the simplest dinners are the best is well known. Dr. Kitchener was never tired of telling his friends that money was the least essential in the preparation of a really good dinner. Some people may have imagined that Kitchener was the nom de plume of some serious gourmand who lived to eat. On the contrary, Dr. Kitchener was a very real personage in his time—a gourmet, a wit, a musician, and a man of science, who believed that eating and cooking should be ranked among the fine arts. William Kitchener was educated at Eton. His father was a London coal merchant, who amassed a fortune and left his son a competence. The son's character was eccentric in no common degree, but underneath his oddities there was a basis of good sense. His wife, it is true, quarrelled with him and left him. Having to attend to his own domestic arrangements, and being somewhat of a bon vivant, he assumed the direction of his kitchen, and superintended the preparation of his food in person. There may have been a special reason for this. In one of his books he confesses to an extraordinary love of animal food, which may have been the result of disease, although we hear of no such stories as are told of Dr. Johnson's appetite, and of that veal pie, well stuffed with plums, which was wont to produce such spasms of gluttony in the great lexicographer Dr. Kitchener rose at a stated hour and went down to breakfast at 8.30, took luncheon at noon, dined at 5, supped at 9.30 and went to bed at 11. Breakfast was light but nourishing. Luncheon was a more substantial meal—savory patés, potted meats of various kinds, fried and broiled fish, grills, cutlets and entrées, together with sound wine and excellent coffee and liqueurs, made up the mid-day repast. A 5 o'clock dinner, arranged according to the precepts set forth in Dr. Kitchener's famous book, led up to the comfortable supper which brought the well-spent day to a close. It must not be imagined that so much eating and drinking resulted in selfishness. The good doctor delighted in hospitality. When he gave a dinner party the guests were invited for 5 o'clock, and at five minutes past that hour the street door was locked and the key laid upon the dinner table. For many years he gave a dinner every Tuesday evening, and on these occasions a placard was suspended over the chimney-piece with the inscription: "Come at 7—go at 11." Tradition says that George Colman the younger once inserted the word "it" after the "go." Oysters, of course, began the doctor's meal. "Delicate little creatures, he exclaims in a letter, "they are as exquisite in their own taste as in that of others. Common people," he tells us, "are indifferent about the manner of opening oysters, and the time of eating them after they are opened. Nothing, however, is more important, in the enlightened eyes of the experienced oyster eater. Those who wish to enjoy this delicious restorative in its utmost perfection must eat it at the moment it is opened, with its own gravy in the under shell. "If not eaten while absolutely alive, its flavor and spirit are lost. The true lover of an oyster will have some regard for the feelings of his little favorite, and will never abandon it to the mercy of a bungling operator, but will open it himself and contrive to detach the fish from the shell so dexterously that the oyster is hardly conscious he has been ejected from his lodgings till he feels the teeth of the piscivorous gourmand tickling him to death." This is almost as attractive a picture as that of Piscator, in the "Complete Angler," impaling the worm on the hook "as if he loved him." In the way of extravagant menus the writer has some from Paris and some from New York. One of the Paris menus appeared in *Figaro*, and was for a dinner costing 103 francs, or $21, at the Café Anglais, of which sum 45 francs was for wine. As against this modest repast the following extravagant and extraordinary mixture was proposed by a New York chef as something which a millionaire might eat, pay for, and—live: Sherry cocktail, 30 cents; oysters on half shell, 50 cents; Yquem Créme de Téte, $8; green turtle soup 75 cents; half bottle Ashburton sherry, 1840. $3; Alose à la Maréchale, $2.50; Steinberg Kaiser wein, $10.50; cucumbers, $1; croustades de truffes, $4; lamb, mint sauce, $10; little peas, $1.25; champagne, $4; ris de veau à la Choiseuil, $2; terrapins au madere, $4; sorbet, $1; cigarettes, 25 cents; chaud-froid d'alouettes, $5; Château Lafitte, 1865, $6; faisan d'Angleterre, $10; Clos Vougeot, $10; chicoré salade, 50 cents; old port, $2.50; glacé Nesselrode, $1; Madeira, 1834. $7; strawberries, $5; grapes, $4; café, 25 cents; poussé café, 40 cents; cognac, 40 cents; cigars, $1.50; flowers, $7; decorated menu, $5; total, $109.50. To go back to simplicity. It has often been asked how eating could be made profitable to mind and body when the larder contained but little

meat and no costly trimmings. A diet of oatmeal and vegetables is profitable if it permits people to obtain a country life, plenty of sunshine, leisure, books, and a wood fire. Here again I believe that a little intelligent work in the kitchen will result in making much out of little. Soups cost next to nothing. The French peasant thrives upon what our American housewives throw away. There are a dozen little books published which show how good living may be obtained at small money cost; intelligence is the one essential. Bronson Alcott was responsible for many of the dietetic vagaries supposed to accompany intellectual activity of the transcendental type. He followed out his vegetarian precepts at Fruitlands, accepting only such vegetables as grew upward, rejecting potatoes, beets, carrots as unclean, and taking cabbages, tomatoes and fruits. Alcott would allow no manure on the fields of Fruitlands, denouncing its use as a wicked forcing of nature, from which we may infer that the cabbages were poor. No wonder that members of the devoted band now and then, in moments of weakness, appealed to the neighboring farmers for a good meal of meat, bread and potatoes. Not even Alcott's curious device of baking his loaves in fantastic shapes of animals and birds could entirely satisfy his disciples.—*Recorder.*

Straws show which way the wind blows. Watch them—and be convinced. When you see all sorts of washing powders patterned after *Pearline;* when you see it imitated in appearance, in name, in everything except merit; when you find three persons using *Pearline* where two used it a year ago; when you hear it as a household word with the best housekeepers; when you find its former enemies now its staunchest friends;—then you may know the wind is taking you along toward *Pearline.*

Why not go with it? You are losing money by trying to head the other way; money, and labor, and time and patience.

Go with the rest—use *Pearline*—and you stop losing, and begin to gain. Millions realize that there is everything to gain and nothing to lose—with *Pearline.*

Blowing Peddlers and some grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—but what a puff for Pearline. 199 JAMES PYLE, New York.

MAP MOUNTING.

HOW TO GIVE DRAWINGS A CLOTH BACKING.

A Washington correspondent of the *Scientific American* gives the follwing practical advice: To begin with, a paste of good quality is required. When paste is made at home, trouble often arises from scorching, or from the addition of too much water. Thoroughly made paste, when spread on paper, will not strike through, but will remain on the surface, like butter on a piece of bread. To enable the paste to keep for several months in a cool place, add dissolved alum as a preservative, in the proportion of a tablespoonful of pulverized alum in two quarts of warm or hot water. Put the water in a tin pail that will hold six or eight quarts, as the flour, of which the paste is made, expands greatly while it is boiling. As soon as the water has cooled, stir in good rye or wheat flour until the liquid has the consistency of cream. Beat thoroughly with a paddle-shaped stick, and see that every lump is crushed before placing the vessel over the fire. Care should be exercised to have the water cool before adding the flour, otherwise the paste will be lumpy. To prevent scorching the paste, place on the fire a pot or kettle partly filled with water, and set the pail containing the paste material in the water, permitting the bottom to rest on a few large pebbles to prevent excessive heat. Of course, a "farina kettle," or "double boiler," is better, and will be less troublesome to handle, but the "ruling element" of the kitchen will not always permit its use. Add a teaspoonful of powdered resin, a few cloves tied to a cloth, so that they will flavor and not discolor the paste, let it cook until it asumes the consistency of "mush," then, if any lumps appear, strain through a sieve Keep in a tight jar, and if it becomes too thick after standing, put the quantity required in a suitable dish, and thin by adding cold water and stirring thoroughly. So much for the paste. Now let us proceed to the mounting. Cut the cloth from one to two inches larger all around than the drawing or paper to be mounted. Lay it on a drawing board or table, dampen well with a sponge, stretch lightly, and tack down; use small tacks, and place them four or five inches apart, or closer, if necessary. Leave it for a moment, and while its surface is evaporating and absorbing the surplus dampness, lay the drawing, map, or paper to be mounted face downward on another table, and dampen the back with a wet sponge. Returning to the cloth, with a brush (a large, round, fine-haired paint brush is best) lay the paste on evenly and smoothly, and then, after the surface is well covered, take the brush and beat the paste thoroughly into the pores of the cloth. After this is done, smooth the surface nicely. Take up the paper by the corners, and, if the thickness of the paper seems to require it, apply the sponge again. The paper should be limp, but not wet. If it is not well prepared, my experience has been that the surface will "blister," particularly on large drawings, for the paste adheres much better to a damp surface than to a dry one. At this stage it is best to obtain some assistance. Have your assistant grasp two of the corners of the drawing or paper while you manage the others, holding the paper suspended horizontally a few inches above the cloth. When it is in the right position place your end on the paste-covered cloth, while your assistant still holds his end up. Place a piece of clean paper on top to prevent smearing the sheet and with the hands brush quickly from the middle of the end toward both sides, working constantly toward your assistant as he slowly lowers the paper to the cloth. Rapid manipulation is necessary to insure perfect contact and a smooth surface. Should any "blisters" develop, rub them briskly with the bone handle of an eraser or any similar substance. Small indulations will disappear when the cloth dries. Stand the board aside with the cloth tacked to it, and allow to dry thoroughly, then cut off as required. Ordinary bleached cotton cloth or sheeting makes a good backing for small sheets, while large ones are best mounted on a heavy grade of unbleached material. These directions are general, and have been found to work well in practice. Individual experience can alone, however, determine many of the details. Other paste than that described may be used if desired, though it is doubted whether a better can be obtained. Should any of your readers know of a better method, many would doubtless be glad to hear of it.

A BEAUTIFUL COMPLEXION.

If the face of a beautiful women or a young child be scrutinized through a magnifying glass, it will be found to be covered by a fine thin skin of considerable uniformity and translucency. At the temple just below the cheek bones and under the chin and jaw it is the thinnest and cleanest. It is smooth and soft. Here and there small fine hairs proceed from delicate cells. These are invisible to the naked eye or else are recognized as down. At frequent intervals are minute pores whose edges are generally moist and delicate glands containing the smallest quantity of thin oil. There are also cells in which future hairs are to grow, half-formed lines and creases produced by the ceaseless play of the muscles of the face and occasionally dark spots, where the blood has failed to carry away either its own humors or the debris resulting from the wear and tear of the tissues. Just below the outer skin can be seen the true skin although it is faint and but partially visible. On its surface can be dimly discerned tiny veins or capillaries, lymph-vessels, nerve-tips, pores and glands. If the face of an unhealthy person with a bad complexion be next examined, a similar and yet an entirely different state of facts will be found to exist. The skin is no longer fine, but coarse and irregular. At some points it will be thick and still further thickened by patches of dead skin, while at others it will be as thin as almost raw. At different places its translucency will be destroyed by deposits of humor or debris, or by dried cells from the circulation, or from discolored elements from the kidneys and liver, which should have been eliminated from the system. The hair cells are swollen and in some there is dirt from without. The pores are clogged; in some instances with exudations from within, and in others with dust from the atmosphere. Some are abnormally enlarged by over-use and others closed up from non-use. The glands are in a still worse condition. All are marked by the unnatural presence of dirt of some sort. This may come from within or without and may produce a simple enlarged interior or on the other hand may create an intense local irritation and inflammation. Frequently it goes farther and expresses itself in suppuration. These various stages in ordinary language are termed blotches, rashes, blackheads, pimples, comedones, cat-boils, boils and ulcers. In the true skin beneath the outer skin, things are equally bad. The capillaries are engorged, the lymph-vessels are swollen and sluggish, and the tissues in every direction are discolored and often disorganized. This difference so vast between the face of perfect health and that of sickness is due entirely to the difference in the condition of the blood. Purify the blood and in a short time the differences disappear and the fine complexion of physical well-being returns. To effect this change is not so difficult as may be supposed. All that is necessary is to take a course of warm baths for the exterior of the body and Ayer's sarsaparilla for the interior. This magnificent preparation is not a drug nor a "cure-all," but merely a scientific blood-purifier. Used according

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

to common-sense, it expels all humors, first from the circulation, then from the deeper tissues of the body, and finally, from the skin of face and body alike. The various parts return to their normal state and, in a short time, the unhappy victim of careless living is restored to health and his or her complexion assumes that charm and beauty which represents a perfect hygienic condition within.

MICA MINES.—Mica, which stands unique among minerals as an insulating substance, is destined to become one of Connecticut's leading products. Three new mines have recently been discovered in that State.

ESSENTIAL.—Grip—I always pay as I go. Sack—So do I. It's the only way I can get my baggage.

SHOCKING CRIMINALS.—The authorities of the Ohio penitentiary have been using an electric shock for the purpose of punishing inmates. A legislative committee investigated, but did not find that any atrocities had been committed.

MEDICAL CONVENTION.—The Forty-second Session of the American Medical Association will be held in Washington, D. C., on Tuesday, Wednesday, Thursday and Friday, May 5th, 6th, 7th and 8th, commencing on Tuesday at 11 o'clock, a. m.

ROUGH ON ROWDIES.—One of the latest proposed applications of electricity is a policeman's club that contains a galvanic battery. When the rowdy seizes the club, thinking to wrest it from the policeman, the rowdy receives an electric shock, which astonishes and paralyzes him, rendering his capture easy.

CHANGED DATE.—The National Association of Railway Surgeons will convene at Buffalo, N. Y., Thursday, April 30, 1891. This is a change of one week from the time previously announced, the change having been made so as not to conflict with the dates covered by the meeting of the American Medical Association.

LONDON FIRES.—The quantity of water used for extinguishing fires in London during the year 1890 was between 20,000,000 and 21,000,000 gallons, or about 92,000 tons. Of this quantity about 8,000,000 or about 40 per cent. of the whole, was taken from the river, canals, and docks, and the remainder from the street pipes.

A GOOD MOVEMENT.—A movement has been started to honor the late Captain James B. Eads, by erecting in the city of St. Louis, Mo., a fitting monument commemorative to the life work of the great engineer. The Eads Monument Association, with headquarters at St. Louis, has been organized, and subscription blanks have been sent out to engineering societies in different parts of the country.

HARDENING STONE.—Soft oolitic limestone or limestone with spherical granules, is now hardened into marble by treatment with a certain chemical solution, which gives the stone a thick, strong skin about half an inch deep, capable of a fine polish. Soft oolitic can thus be worked into any form and hardened afterward. The marble becomes impervious to damp and atmospheric influences.

A DOLLAR MARK.—There is a popular idea prevalent that the minute letter "M" to be seen at the base of Liberty on the face of the present issue of silver dollars stands for "Mint," and is an evidence of the genuineness of the coin bearing it. This is a mistake, says the Philadelphia *Record*. The "M" stands for Morgan, George T. Morgan, who is the originator of the design. Upon the same side there is another "M," also the initial of the designer. This is to be found in the waving locks of the fair goddess, and is so cleverly concealed in the lines of the design that it can only be seen after a long scrutinity. A prominent mint official, in speaking of this other initial, said he had it shown to him scores of times, but could never find it unassisted.

RULES FOR GRADING HAY AND STRAW

As Adopted by the N. Y. Hay Exchange.

CHOICE OR PRIME HAY—Shall be pure timothy, properly cured, bright, natural color, sound and well baled. No. 1—Shall be timothy, not more than one-eighth (⅛) mixed with "red top" properly cured, bright natural color, sound and well baled. No. 2—Shall be timothy, not more than one-quarter (¼) mixed with red top and blue grass, properly cured, good color, sound and well baled. No. 3—Shall include all timothy not good enough for No. 2, proportionately mixed with blue grass, red top, and clover, sound and well baled. SHIPPING—Shall include all hay not good enough for other grades, and may be natural meadow, free from wild or bog grass, and must not contain over one-third (⅓) clover, sound and well baled. CLOVER MIXED—Shall include all hay containing not over two-third (⅔) clover, and one-third (⅓) timothy, properly cured, sound, and well baled. CLOVER—Shall be medium grown, properly cured, good color, sound, and well baled. NO GRADE OR REJECTED HAY—Shall include all hay badly cured, musty, stained, or in any way unsound.

No. 1. RYE STRAW—Shall be clean, bright, long Rye, in bundles, sound, well and securely baled. No. 2—Shall be long Rye, in bundles, sound, well and securely baled. SHORT RYE—Shall be clean, not bundled, sound, well and securely baled. OAT STRAW—Shall be clean, bright, sound, well and securely baled.

In the New York market bale-wood is weighed in without tare. In all other markets it is deducted.

These quotations for choice, No. 1 and No. 2 hay are for large bales. 5c. per cwt. less when in perpetual press bales.

The New York quotations are per cwt. At other points, per ton.

NEW YORK, April 27, 1891.

The following are the market prices to-day at New York

	Large Bales.	Small Bales.
Fancy Hay	65c @ 70	60 @ 65
No. 1	60 @	55 @ 60
No. 2	50 @ 55	50 @ 55
No. 3 and Shipping	40 @ 45	40 @ 45
Clover Mixed	45 @ 50	45 @ 50
Clover	40 @ 45	40 @ 45
Long Rye Straw	80 @ 85	45 @ 50
No. 2 "		
Oat Straw	35 @ 40	35 @ 45
Wheat Straw	40 @ 45	

Receipts week ending April 25, as follows:

Via N. Y. Central	144 cars.
" West Shore	105 "
Other roads by Lighter, 34th Street	115 "
Total	364 cars.

The receipts by rail have continued light, but the river barges have brought forward considerable hay, thereby preventing any advance in prices. Common and medium grades are plenty, while prime or fancy hay in large bales is meeting ready sales at 65 to 70 cents.

Perpetual pressed bales of medium and common qualities have accumulated owing to small shipments of cattle, and therefore sales have been forced in order to unload cars, as all roads, except the New York Central and West Shore, are threatening the enforcement of demurage charges.

COMMISSION MERCHANTS,

HAY, STRAW, FLOUR & GRAIN.

E. B. HOSMER, G. W. CRAMPTON, BENJAMIN HAMMOND, A. L. ROBINSON.

BOSTON HAY AND STRAW MARKET.

Hay, choice to fancy, in large bales	$13.50 to $14.50
Hay, choice to fancy, perpetual pressed bales	13.00 to 13.50
Hay, fair to good	11.00 to 12.50
Hay, poor to ordinary	9.00 to 11.00
Hay, Clover and Clover mixed	10.00 to 11.00
Hay, swale	8.00 to 8.50
Straw, Rye, good to prime	17.00 to 17.50
Straw, Oat	8.00 to

BOSTON, April 25th, 1891.

Receipts for the week are 258 cars of Hay and 18 cars of Straw; corresponding week last year, 171 cars of Hay and 23 cars of Straw. The receipts of hay are quite liberal while the demand is rather quiet. We quote the market barely steady at quotations.

Some winter pressed hay is coming out in a more or less heated and damaged condition; such is only salable at low prices. Rye straw is quiet with larger receipts. Oat straw very dull.

H. F. WILSON,
WIRE BALE TIES,

THE CENTURY DICTIONARY

comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to

THE CENTURY CO., 33 East 17th St, New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month,** and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions,** arranged for practical use; timely hints to **Housekeepers;** cheering and helpful talks with **Mothers;** valuable information for lovers of **Flowers;** a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

OUR OFFER Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

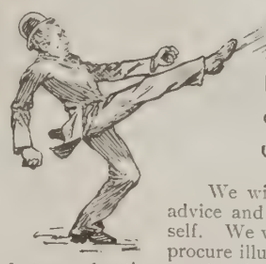
Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.



The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

NATRONA TRADE MARK SODA

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

MILLENNIAL SPECULATIONS.

The announcement, more or less startling according to the acceptance it receives, was recently made that Professor Totten, of the Sheffield Scientific School of Yale, has perfected a mathematical calculation, founded on Biblical truths, which he says proves beyond question that the Messiah will reappear on the earth in the year 1899. This is the ingenious scholar who some time ago fixed the exact date when Joshua commanded the sun to stand still. He has also made curious calculations to show that the fundamental dimensions of the Great Pyramid are founded on distances in the solar system, and employed the inch unit of measure known to our English system of long measure. He has further made studies to show that Americans are the lost tribes of Israel. It is not improbable that, in some form or another, we may witness a considerable revival of millennarianism. One of the last noteworthy agitations of the subject was that of Dr. John Cumming, who had fixed the beginning of the millennial period for about a quarter of a century ago. But a quarter of a century before that a far more widespread and famous excitement was caused in the United States by William Miller, who had predicted the Second Advent for 1843. But more or less important predictions and agitations can be found during many centuries. The grades of belief on the subject have varied from that of an approaching destruction of the world at a fixed hour to that of a coming in of the Golden Age without any physical crash. In various countries there have been sects that have held from time to time that the millennium had already begun, and that they were enjoying its opening years. The last decade of years of the present century, on which we have now entered, is likely to turn speculation anew in this direction; and presumably the twentieth century will see it still more rife, and gaining in intensity as the year 2000 approaches. A learned divine of the Dominion has for some time fixed upon that date for the Second Advent, arguing that the greatest crises in human history have occurred at intervals of 2,000 years from the creation, assuming this last to be about 4,000 years before the Christian era. The same date has been fixed by those who hold that the six days of creation signified or typified six periods, of 1,000 years each, in the world's history, devoted to toil and endurance, to be followed by a seventh of blissful rest. But what is most singular is the variety of texts and calculations adopted by those who deal with the subject.

PATERNAL GOVERNMENT.

One of the harmful results of the insidious teachings of visionaries of the Bellamy school, is visible in the growing willingness of the American public to subordinate individual rights to legislative control. This is glossed over with the phrase "Nationalism"—a suggestion which if reasoned out to its logical conclusion means the substitution of "government" for liberty—of "paternalism" for personal freedom. The contraction of liberty and the expansion of nationalism are clearly shown in the ten thousand bills introduced last winter into our state legislatures, to say nothing of the laws enacted or proposed by congress. To "have a law passed" appears to be the ambition of every man, and of every interest, from the millionaire ship owner or mill owner, or mine owner, to the hod carrier and the shoveler. Men are no longer supposed to be of age at twenty-one, nor even at forty-one. In the very pride of their strength and manhood they are placed under the guardianship of "government." Government must make their contracts for them, feed them with a spoon, and attend to all their business. In California, for instance, hundreds of bills were introduced of which the following are specimens worthy of careful study: one, making the employment of persons not American citizens by contractors or sub contractors a misdemeanor; another, making it unlawful to offer less than two dollars per day to unskilled laborers hired to work for the municipalities or the State; another, requiring that employers shall give three hours on election day to all their employes; and another, to establish a trout hatchery near San Francisco. The superstition is becoming general among us that "Government" lives up in the sky, that it has accumulated stores of impossible blessings to shower down upon its favorites, and that it has a guardian angel in the shape of a policeman to protect and care for every citizen. Independence is becoming a burthen to us, so we pray for masters to take us into their keeping, put our wills into harness, and guide our feeble minds. The tendency of this Nationalistic legislation is made clearer to us by the actual bills themselves than by any quantity of abstract moralizing on their character, the general inclination being to surrender thought, will and action into the keeping of the Government. In Pennsylvania is a bill to enable barber shops to keep open on Sundays, and in South Dakota is a bill to compel barber shops to remain closed on Sunday, a matter which it seems might properly be left to the laws of health and cleanliness, without interfering with the liberty of barbers. In Illinois is a bill to pay a bounty of one cent a pound on all the sugar made in the State from sorghum, beet or maple, while Nebraska has a bill to repeal that bounty. In Wisconsin is a bill compelling the payment of employes weekly, in Missouri a bill to compel mine owners to pay their employes every ten days, and in New Jersey a bill requiring hired persons to be paid fortnightly, with a Saturday half holiday thrown in, our kind and meddlesome old grandmother the State assuming that the citizens are not yet of age, and therefore not capable of making contracts for themselves. In Indiana is a bill to prevent the playing of base-ball on Sunday, and another compelling managers of State institutions to purchase native live stock for consumption; and in Dakota is a similar bill to encourage the use of native coal in State institutions. In Illinois is a bill allowing three cents to every inhabitant who kills an English sparrow, and in Indiana a bill giving a bounty of one cent for the scalp of that pugnacious bird; the consequence of which discrimination will be that the Indiana sparrow killer will send his birds over into Illinois, where the bounty will be three cents per scalp.

THE DEADLY CIGARETTE.

To a query as to the injurious effect of cigarette smoking, the Chicago *Herald* replies as if a deep, rich vein of disgust had been tapped in its soul: There is but little evidence that cigarettes are made of tobacco. They don't look like tobacco, don't taste like it, and certainly don't smell like it. Tobacco smoke has a pleasant odor; but if there is anything on the earth or in the waters under the earth that has a more disagreeable, nauseating, noisome, disgusting, loathsome, pernicious and nasty smell than cigarette smoke it has not been discovered. It is said that vermin will not bite a

cigarette-smoker. What are the materials used for the manufacture of cigarettes? We give it up. The imagination is staggered at the conundrum, and the system becomes unsettled when the mind grapples with this problem.

INVENTOR'S ASSOCIATION.

The principal benefit resulting from the recent Patent Centennial Celebration held at Washington, D. C., was the formation of a National Association of Inventors and Manufacturers. This will, without doubt, prove one of the important events of the period, and of vital interest to the inventors and manufacturers of this country. Perfect harmony and good feeling pervaded all the business sessions, and the National Association was formed without class or sectional jealousy. The election of officers and directors for the ensuing year resulted as follows: For President, Dr. R. J. Gatling, of Hartford, Conn., the inventor of the celebrated gun which bears his name, and which has brought him large remuneration and great fame, as well as distinction to our country as the producer of the most powerful projecting gun in the world. The four Vice-Presidents are Dr. Gardner G. Hubbard, of Washington, D. C., an inventor, and the father-in-law of Hon. Alexander Graham Bell, inventor of the telephone; Prof. William A. Anthony, President of the American Institute of Electrical Engineers; Thomas Shaw, Esq., Philadelphia, inventor and extensive manufacturer, and patentee of 110 inventions, and Hon. Benjamin Butterworth, Ohio, former Commissioner of Patents, ex-Chairman of the House Committee on Patents, and now Secretary of the Columbian Exposition. The selection of Prof. J. Elfreth Watkins, Curator at the National Museum, as Secretary, met with unanimous approval, and was a most excellent choice, as is attested by the success of his untiring efforts, during the last four months, as Secretary of the Patent Centennial. Mr. M. C. Stone, of Washington, an inventor and enterprising manufacturer, was elected Treasurer. The Board of Directors is composed of the following gentlemen: John Wise Smith, Esq., engineer, Pennsylvania; David G. Weems, Esq., electrical railway engineer, Maryland; Prof. R. H. Thurston, of Cornell University, New York; Chas. F. Brush, Esq., inventor and manufacturer of electric lighting apparatus, Ohio; Prof. Otis T. Mason, Curator, National Museum, Washington, D. C.; Hon. David M. Smith, manufacturer of sewing machines, New Hampshire; F. E. Sickels, inventor of the first steam steering machinery, Kansas City, Missouri; Oberlin Smith, Esq., manufacturer, New Jersey, and R. S. Munger, Esq., manufacturer of cotton machinery, Alabama. In addition to the regular officers and board of directors there will be representatives in every State. At an informal meeting it was suggested that there be a committee of seven on legislation to advance the interests of the patent system before Congress, and guard against any encroachment upon the rights of inventors and manufacturers.

HATS AND HAT MAKING.

DETAILS OF AN EXTENSIVE AND IMPORTANT MANUFACTURE.

In Danbury, Conn., more than 6,000,000 hats were made last year. Some hats, most of them for women and children, are made of wool, which is cheaper, but does not wear so well as fur, but by far the larger number of men's stiff and soft hats are made of fur. The best fur for this use is that of the nutria, a South American water animal, something like the beaver, but not so large. The steadily growing demand for nutria fur for other purposes as well as for the manufacture of hats, has raised the price of it so much that it is now used only in the finest hats. Next to the nutria the most expensive fur that hatters use is that of the Russian and German hare; then comes the fur of the cony, from Europe. The cony is something like the rabbit. The fur of the American rabbit and that of some other animals is also used. The skin is cut from the fur by a machine with revolving knives, which cut it off in shreds. The fur is left full length, and, as it rolls away from the knives, it preserves the general outline of the skin. The fleeces of fur are folded and packed, a number together, in small bundles. Formerly the greater part of the fur used here was imported already cut, but we are now competing with foreign countries in fur cutting, and about half of the fur used in this country is now cut here, in this city, in Brooklyn, and Connecticut. In making hats different kinds of fur are mixed. Various hat manufacturers have various mixtures which they keep to themselves; each strives to attain the best results in finish and durability with great economy. The process of hat making is thus given: The bundles of fur are opened, and the fur in the combination and proportions deemed best for the kinds of hats to be made is laid in a mixing box. Thence the fur is put into a simple machine, in which it is still further mixed. Then it goes to the "picker room." In this room the fur is freed from bits of skin, hair or any other foreign substance. A minute fragment of skin on the surface of a hat would spoil it. The fur goes in at one end between iron rolls to a picker which makes 2,400 revolutions to a minute. The picker is a small horizontal cylinder with short wire teeth. There is a series of rollers and pickers interspersed with blowing chambers. The pickers straighten out the fibres of the fur, which drops on a sieve. The hair, bits of skin and so on, including, sometimes, coarser bits of fur, drop through. These bits of fur are separated from the other substances and put through the machine again. From the picker the fur goes into a blowing chamber. Here it floats about softly, in an appearance not unlike a drab foam, and is still more thoroughly mixed. It goes on through the series of rollers, of pickers and blow chambers, and comes out from between the rolls at the other end a sheet of fur uniform in color and appearance, something like drab cotton wadding, except that there is no glaze on the surface. It holds together, but it is easily parted. The fur goes now to the forming room, where the hat bodies are made. It is weighed out according to the grade used and the size of the hat to be made. The weighing is done with accuracy, the weights varying by fractions as small as the sixteenth of an ounce. At one end of the forming machine is an apron upon which the fur is spread to be fed into the machine; at the other end is the trunk, which is the part in which the hat body is formed. The trunk looks something like a tall, substantially built water pail, with a fixed rounded cover. It is about 7 feet in height, about 2 feet in diameter inside of the bottom, and it flares to a diameter of 3½ feet. From this point the upper part of the trunk, which is perhaps one-fifth of the total height, and it is nearly flat on top; so the top is like a flattened dome. In the front of the trunk are to large doors which open down to its floor, right and left from the centre, and afford the freest access to the interior. Level with the floor of the trunk and in its centre is a little turn-table which turns around about 70 times a minute. Underneath is an apparatus which produces in the trunk a constant and uniform draught downward. A hollow cone made of perforated sheet copper, and with the top rounded instead of pointed, is set on the turn-table. The perforations are as thick as those in perforated cardboard. When the door of the trunk are closed the draught draws the air through the perforations of the cone. The apron is a flat table about 2½ feet square, attached to the machine. A young woman takes a portion of fur from one of the little square boxes, spreads it upon the apron, and feeds it evenly into the machine. It goes through a picker and a brush. The picker makes 5,000 revolutions a minute. It picks the fur and throws it into separated hairs to a blower running at high speed, which blows it into the dome of the trunk, where it floats like a shower or haze of fur. Then the draught from the bottom draws the floating fur down to the cone. It doesn't go through the perforations, but it completely covers the outside of the cone and clings to it, held by the draught. By means of simple contrivances the draught may be so regulated as to make the fur light upon the cone where it is most wanted. For most hats greater thickness of fur is required in the brim. The fur can be drawn to the cone and held to it in a deposit that is thin on top and increases in thickness down the sides to the base all around. While the draught is on, it is difficult to pull any of this fur away; if the draught is stopped, it is easy to pick it off with the fingers. It takes a minute or so for all the fur to settle on the cone; then the man who runs the machine opens the doors of the trunk and throws upon the cone a wet cloth which entirely envelops it. Over the cloth he places a cone-shaped tin cover like an extinguisher. The two cones, with the fur cloth between, are taken from the turntable and put on a wooden rack in a tub of hot water. When the cones are placed upon the rack it sinks with them until they are entirely submerged. Almost instantly they reappear and rise steadily from the water until they are again clear of it. They are lifted to a table, where the tin cover and the cloth are taken off and the perforated cone is turned bottom up. The hat body has already begun to shrink. It starts to roll off of itself. It is quickly but gently stripped down, and it sinks on the table wet and limp. It is taken by the top, straightened out and doubled over. This handling may appear to be done carelessly, but really it is done very carefully and skilfully. Then the hat body goes to the hardening room, where it is examined. It is now 2½ feet tall. When it has been examined it is rolled up. The rolling up makes the fur stick together, and the body keeps on shrinking; then it goes to the sizing room, where the hats are felted. Five hat bodies are laid together and made up in a roll. This roll is dipped in a tub of hot water and then rolled up in canvas, dipped in the water again, and laid on the lower rolls of a sizing machine just over the tub. The sizing machine has three horizontal revolving wooden rollers—two side by side below, and one a few inches above. The rollers have wooden lags or strips placed lengthwise. The bottom rollers turn upward, so that the roll of hat bodies is not drawn down, but it is rolled over between them and pressed gently, at first by the lower rollers only. The hot water, the motion, and the gentle pressures makes the bodies shrink; they are unrolled and again folded and dipped and rolled up. After going through two or three machines in this manner, they get one whose top roller is so adjusted as to help in the pressing and rolling. The hat bodies are shrunk to sizes and proportions, and all the manipulation requires care and skill. The hat body, folded flat, now measures about 10½ inches from the centre of the crown to the edge of the brim; standing like a cone, the diameter of the base is about 10½ inches. In the next room the hat is laid on the table, and with one sweep around the rim with a sharp knife the edge is made uniform and smooth. Little notches are cut in the edge to indicate the size. The hat then goes to a drying room, and then to a shaving room. In felting that body the hair that may remain in the fur works to the surface. The hat body is put on a turning machine and the outside is shaved off by knives that work something like the cutters of a lawn mower. The hat thus far followed is to be a stiff hat, and it goes next to the stiffening room, where the brim is dipped in shellac. This is done by hand very quickly and with great accuracy; then it is passed up between rollers, which squeeze it and leave in the brim the needed quantity of shellac. The crown stiffening is applied on the inner side with a brush by hand; then the hat goes into a steam box. The steam drives in the shellac, and the hat is put in a weak acid to set the stiffening. Then the hat goes to the blocking room. It is placed on a star, which is a frame of curved ribs radiating outward and downward, the general outline being something like that of the crown of a hat. Over the star is its

counterpart, the tip machine which is movable, and works the upper part of the hat body on the star into shape. The next star is larger, and on this the crown is brought nearer to shape; then the hat goes to machines which stretch and shape the brim. The hat looks now something like a soft travelling hat that has been stiffened. It is put in a vat of dye to be colored, and from there it goes to the blocking machine. After a hot bath it is put on a form. A shaper, which has a lever attached, is brought down over the hat; it flattens the brim and shapes the crown except on the top. After removing the shaper the hat is cooled with a stream of cold water and is put in a whizzer, which revolves it rapidly and expels most of the moisture from it; then it goes to the drying room and the next day to the squaring-up room, where the hats are sorted by sizes and squared up with shellac inside; then they go to the dry room again, and then to the finishing room. The hat is put on a block and sponged, ironed, brushed, sand-papered and singed. Without describing in detail or in sequence the elaborate work done in the finishing room, it may be said that here the crown of the hat is brought into shape and finished. The brim is finished as to its surface, but it is still left perfectly flat. The finer hats are finished by hand and the coarser ones by machine. The ironing of a machine-finished hat is done by an iron which is attached to a movable arm, and heated by gas fed into it through flexible tubes. As the hat turns on a block the iron adjusts itself with great accuracy, finishing its work at the centre of the crown and then dropping away. After the finishing the hats are again examined, and the defective ones are thrown out. The hat then goes to the rounding machine, which cuts off the edge of the brim and leaves it of the desired dimensions. The edge of the brim is stiffened with a preparation of shellac cut with alcohol, and the hat goes to the curling room. It is put, brim down, on a form which revolves slowly on a vertical axis. Two little steel arms, one on each side, turn the edge of the brim over, and two irons, one on each side, iron it down as the hat goes around. Then the hat is put in a round curling machine, which curls the edge of the brim and gives it a little dip at the ends. The edge is planed smoothly by machine in the shaping room where the brims are shaped. It is then laid on a baker, an iron table heated by steam. This heat makes the hat pliable. The finer hats are shaped by hand; others are placed, crown downward, on shaped forms that support the brim. Suspended over each form is a rubber bag filled with sand; when the bag is dropped it shapes the brim to the form. An endless wire of exactly the right size, and shaped to follow the curves of the brim, is inserted under the turned-over edge; then the hats are again examined and sent to the trimming room. The work here is all done by women. When the hats have been trimmed completely they are examined for the trimming and then they are sent to the packing room, where they pass the general inspection and are brushed by a machine. Now the hat is finished and ready to be packed. In the manufacture of soft hats the process is the same as stiff hats up to the final shrinking of the bodies, which are shrunk with a view to the style and dimensions of the hat to be produced. After the shrinking the processes vary in some details, but they are in their main features substantially alike.

BACTERIA.

A CHAPTER IN THE LIFE HISTORY OF A MINUTE ORGANISM.

Far down in the scale of plant life, is a certain great group whose individuals are spoken of in a general way, as micro-organisms, or microbes, or germs. One great family of the group of micro-organisms is called "yeasts." The commercial value of the single yeast plant my be estimated from the fact, that the cake of yeast costing the consumer one cent, contains many million plants. When these yeast plants, well distributed through the dough are set in a warm place, they begin to grow, and in order to grow they must consume food. Now, the flour and salt and water in the dough are very choice viands for these little plants, they assimilate some elements, and set free, among other things, carbonic acid gas. This occupies much more space than the carbon and oxygen occupied in the flour, and the gas as its expands "rises" the dough, rendering it light and porous. At the right moment off goes the whole mass to the oven where the lives of the myriad budding plants are soon extinguished; and when we eat bread, we eat the yeast cells, along with the fragments of the cells of the wheat or rye of the flour. Another familiar group of micro-organisms are the moulds; and still another group of lowliest, tiniest plants, closely allied to the fungi, are the bacteria—elemental organisms so simple in structure as to be almost completely represented by lines and dots, but endowed with such limitless powers of reproduction as almost to shame the multiplication table. Under the most powerful lenses, they are seen to consist of a minute mass of granular protoplasm, surrounded by a thin structureless membrane. When we put them under favorable conditions of growth, and give them food enough, they may be seen to divide across the middle, each portion soon becoming larger and again dividing, so that it has been calculated that a single germ under favorable conditions might at the end of two days, have added to the world's living beings 281,500,000,000 new individual bacteria. Indeed, if this sort of thing were to go on for a few weeks unhindered, pretty much all the oxygen, carbon, hydrogen, and nitrogen available for life purposes would be used up, there would be a corner in life stuff, and even the master, man would be forced to the wall. But numerous causes arrest their spread, and the bacteria in the long run are held closely within bounds, the world over. Indeed, life goes hard with many forms: and but for a curious provision for their preservation under adverse circumstances, it is likely that many species would soon die out. It is found that, when the conditions become too unfavorable for the continuance of life in some bacteria, a portion of the protoplasm sequesters itself in one end of the germ, and surrounds itself with a dense resistant envelope. This is called a spore. The old shell falls away, and this spore is now capable of resisting vicissitudes of temperature such as would have destroyed it in its form. Restore the spore however to favorable surroundings, and it bursts its protecting shell, and emerges a thin-skinned and vulnerable, but an active, and perhaps a triumphant germ. All of the bacteria, so far as we know, have the power, in nourishing themselves, of tearing asunder other forms of matter, assimilating a part of it in new combinations in their own bodies, and setting free the rest. These chemical substances which are set free by living, growing bacteria are the most diverse characters. They may be acid or alkaline, aromatic or bad-smelling, harmless or very injurious to man. The soil forms the great living and lurking place of the more common forms, and from this they are spread far and wide, into the air as part of the dust, or are washed off into the surface and other waters. The life history of many of these species of bacteria is well known to us, while whole groups are almost wholly unstudied. This much has been well established, that there are some species which are quite indispensable to the higher forms of life in this world, because it is they which tear dead organic matter to pieces, and fit it to be taken up by plants and worked over into food for men and animals. A piece of meat, or any other organic matter, would remain unchanged indefinitely, if shut up so that no living bacteria could come in contact with it. Under ordinary conditions, however, the bacteria do gain access to all dead organic matter, and then ensue putrefaction, and finally a total destruction, that is, a total change into other forms of matter. The bacteria are thus the great scavengers of the earth. Others are injurious to man. It has been learned within the past few years that several of the most serious diseases known are caused by particular species of bacteria. Among the forms which thus originate are tuberculosis, Asiatic cholera, erysipelas, and some forms of blood-poisoning, tetanus or lock-jaw, some forms of pneumonia, typhoid fever, and diphtheria. We know the germs which are concerned in the causation of these diseases, and can grow them in tubes in the laboratory, and work out their life history. Vast numbers of bacterja are taken into our system with a great variety of uncooked foods, and with water, and milk; and of those which multiply in our bodies, the great majority are innocuous. but a small proportion of them produce substances which act like poisons. These substances are called ptomaines. It is difficult to conceive that all these curious doings, all these far-reaching accomplishments, should be carried on by organisms so small that a thousand of them mustered abreast could pass through the hole pierced in a paper by a fine sewing-needle. and never touch the sides; yet so it is.—*Dr. T. M. Prudden in Harper's.*

DETECTIVE CHEMISTRY.

HOW AN INNOCENT MAN WAS SAVED BY A REAGENT.

The correspondent of the Paris *Temps* tells the following romantic story, which is said to have occurred at a recent sitting of the Appellate Court at Rennes: In September, 1890 a band of sharpers established in that town a business in chemicals under the name of A. Carrie. The method pursued was to set up bogus firms in one town after another. With envelopes and paper bearing fictitious names, imported orders were given to wholesale houses, for which payment was to be made at one, two, or three months' date. The goods thus obtained were sent to receivers of stolen goods in Paris. The band then disappeared, to commence similar operation elsewhere. They were arrested at Rennes. Their leader, Audibert, when questioned before the magistrate, named M. Loque's a Parisian chemist, as the receiver of the stolen goods. One of Loque's letters had, in fact, been seized by the court at the *poste restante*, in which he gave an order Loque owned the letter to be his, but stated he gave the order to what he believed to be a *bona fide* firm at Caen, and not to Audibert. In spite of this defense he was sentenced to eight months' imprisonment. From this conviction he appealed. He had remarked some ill-formed letters or marks on the back of the suspected letter in question, and thought that this note might have served as a secret communication between Audibert and his accomplices. Counsel for the defense claimed examination of the incriminatory document by an expert, and, under the action of a chemical reagent, an entire letter became apparent. It proved to be a communication between Audibert and a receiver of stolen goods at Paris in reference to Loque, who, said the correspondent, refused to have anything to do with Audibert and his band. M. Loque was consequently acquitted by the court after this establishment of his innocence.

WEALTH AND HUMBUG.—The faith curists of this city boast that they have quite a number of wealthy people among their patients. It appears that some of these people are afflicted with maladies that have not yielded to allopathy, or homœopathy, or hydropathy, or patent medicines, or travel, or mountain air, or seabreezes, or careful nursing, or anything else. When all medicaments and experiments have failed, they are ready to try the faith cure, and, though they may not find any benefit from it, they can always live in hope of being benefited by it. The faith-cure practitioners, who are of both sexes, admit that they prefer patients who are wealthy to those who are otherwise, and that they will not guarantee a cure in the case of any one whose faith is less than boundless. It is reported that even some sufferers with boundless faith have been given up as incurable on account of the untimely stoppage of their pulse.

ARTIFICIAL FOODS.

THE NATURAL ARTICLE THE ONLY ONE TO RELY ON.

Several years ago, when a French chemist succeeded in liquefying and solidifying oxygen, speculation was rife as to the possible use to which the new substance could be put as a food. People who believed that there was such a thing as the "principle of life," thought that it could be directly reached and sustained by taking solid oxygen into the stomach, the supposition being that what could support life in one way could support it in another. If we breathe oxygen and it does us good, why should it not do us even more good when we take it in bulk, and let it reach the life principle by absorption through the tissues of the digestive apparatus? There was one fact, however, which was not taken into consideration by the people who thought that at last the true pabulum of life, of which the Rosicrucians and their successors had dreamed, had been found. In the stomach solidified oxygen would almost certainly act as a corrosive poison. Davy imagined that the principle of life must be a gas, and on this notion the theory was built up that the more gas one can get into his body the more lively he is likely to be. The doctrine that there is such a thing as the principle of life except in connection with living and organized matter, is now generally discarded, and the man who believes that he can make an egg from which a chick can be hatched is, doubtless, a bold and original thinker, but in practice his work is likely to be of little value. Eggs come in the natural course of events, and can no more be manufactured artificially than a Frankenstein can make a real and working man. It is, of course, possible to simulate some of the products of nature, in the way in which Italians are said to make blood oranges by injecting aniline colors under the rind of the common fruit; but oranges doctored in this way are the poorest possible of substitutes for the products of unassisted nature. In itself the blood orange is not a particularly desirable addition to a meal, and when it is made artificially it is worse even than the original article. There have been chemists who have been so utterly lost to all ideas of propriety that they have made and set before their guests gelatines and galantines extracted and compounded from old boots and shoes, but nobody except the ingenious chemists themselves has ever been known to take kindly to this variety of food. What we want to get from nature is that which she herself produces in reasonable ways. The orange must be the product of the tree, and the delicate gelatine must come from the sources to which even the primitive man used to look for it when he boiled the bones and sinews of the lower animals that ranged the forests of primordial times. In short, though there are many ways in which man can manipulate for his own purposes even the refuse of nature, there is little or nothing that he can do in the way of improving natural products. The egg of the hen must come directly from the nest, and not be cunningly contrived in the laboratory. The apple and the orange have only one proper way of coming into existence, and that is the way in which they have always grown. "Special creations" of this sort are works for the production of which we must look to a higher power than that of man.

WOMEN AS INVENTORS.

FEMININE IDEAS PRESENTED AT THE PATENT CENTENNIAL.

Writing from Washington under date of April 17, Rene Bache says: "Upon the women of this country a large part of the glory of the Patent Centennial celebration has been cast. Within the last century they have entered, for the first time in the history of the world, as competitors with men in the field of original contrivance. So rapidly have their steps in this direction accelerated, that in the last two years and a half they have secured from the Government exclusive rights in five hundred machines and other devices sprung from their own wits. No longer can it be said as of old that the female of our species 'never invents anything.' To-day three thousand of her inventions are recorded in the Patent Office at Washington, covering all the arts and industries known to the human race. Some of these contrivances devised by women are remarkably interesting. For example, there is a 'pocket spittoon,' designed to cure the objectionable habit of indiscriminate expectoration. Provided with one of these a gentleman can chew tobacco at ease in the most exclusive drawing-room, and without danger of annoying his hostess by squirting the offensive fluid over the furniture. A "pneumatic dress-form' is made of india-rubber with a tube attached, so that it may be blown up to any degree of fatness, and thus be made to play dummy equally well for a slender maiden or the most corpulent of middle-aged ladies. There is also a 'portable balcony,' for purpose unknown, though presumably such a thing would be a most useful convenience for popular actresses or other public favorites, who, in travelling about the country, and on occasions of impromptu serenades, could simply attach the balcony off-hand outside the hotel window where they might happen to be staying, and make a graceful response from its platform. An invention of the kind ought likewise to be serviceable to lovers, *a la* Romeo and Juliet. A really valuable invention of feminine origin is a deep-sea telescope with a lamp attachment, by the aid of which the bottom of the ocean may be examined for wrecks, obstructions to navigation, and torpedoes on occasion. With this apparatus the diver can make a deliberate inspection of the sunken treasure ship before venturing down himself to drive the crabs away from the grewsome corpses and open the chests filled with gold and silver ingots. That reminds me that another woman is responsible for what she calls an 'improved corpse cooler,' intended for preservative purposes; while still another has rights in an 'improvement in floral ornaments for tombstones.' More cheerful in its character is an ingenious trap for bedbugs, which consists of a flat block of wood full of small perforations, and opening on a hinge like a book. It requires no bait, but is simply to be placed in an infested bed, when the vermin quickly seek it because it affords exceptional accommodations for hiding. The block is of unpainted white pine, which is preferred to painted wood by the creatures—and furthermore, after some have once occupied it, others find the trap more attractive. Once in a while the affair is taken out and put into boiling water. This is a sport calculated to afford much innocent amusement to the housewife. Many of these devices invented by women express the most beautiful and unselfish devotion to the comfort and convenience of the men folks. One is a 'pantaloon tree,' though it must not be imagined that what some people call 'pants' actually grow upon this interesting arboreal contrivance. It is merely designed to keep trousers in shape. Another is a 'moustache spoon,' intended to keep that masculine ornament out of the soup, and a third is a perspiration-proof paper shirt, the material of which consists of two layers of thin and tough paper of a peculiar kind, with a stratum of fish-glue between. There is also what its fair originator calls an 'improvement on cigars,' her idea being that each cigar shall have attached to it a corn-stalk mouthpiece, which is expected to improve the drawing of the weed, save the lips from the nasty tobacco, and incidentally economize the material smoked by dispensing with butts. For the use of the laboring man a new sort of dinner pail is provided, which is likewise a dark lantern. He may be detained after dark at his work on winter evenings, or perchance he may be inspired with a notion of adding to his income by employing his leisure in pursuit of burglary. For employment by the fair sex exclusively is a patent rouge-pad made of cotton-wool and soaked thoroughly in a mixture of the purest carmine, juice of the blood-beet, juice of the hollyhock root, extract of sweet clover and water. After being dried the pad is ready for market; it is used by dampening it slightly and applying it judiciously to the face. There are pads for corsets, too, of varied construction, designed to supply curves to the female form divine, and several different 'doll supporters,' whatever they may be. A woman is the inventor of an imitation of braided human hair, and another has devised a process for 'extracting fur from the skins of animals and manufacturing it into yarn.' Still another has found a way to utilize the heat radiated from the bottom of a stove in such a manner as to warm the floor of the room and the feet of the occupants, a tin reflector throwing the heat rays in all directions outward. A machine for 'pricking soles' suggests the witches in Macbeth, although they knew when wicked things were coming by the pricking of their thumbs. To a lady who has suffered from insomnia the idea has suggested itself of a 'sleep encourager,' which is a contrivance consisting mainly of padded springs. The apparatus is attached to the head upon retiring, the springs being so adjusted by means of thumb-screws as to slightly press upon the veins and arteries of the neck; thus the flow of blood to the head is somewhat checked, the brain being kept in this way from undue stimulation, and balmy sleep follows. Further inventions of petticoat origin are a mechanism for making the features symmetrical by pressure applied, a device for protecting tables from crawling insects, a surprising mosquito killer, and a perforated jar with phosphorus and some other things inside, from which 'ozone' can be ground out to order. Woman's inventive genius has naturally been largely exercised thus far in devising household contrivances, particularly for the nursery and the kitchen. She has taken out letters patent on a baby charmer and dental cutter, a baby walker, several improved sorts of bibs, ditto diapers, a baby jumper, and baby chairs. Also in her list of new creations are toy skating rinks, musical tops, novel dolls, and building blocks. In the culinary line there are dough-kneading machines, a mechanical arrangement for greasing baking-dishes, a smoothing-iron that heats itself, a fish scaler, a dish-washing contraption, and many cooking-stoves. Ideas respecting dress are numerously represented, with reference to corsets most of all. The corset seems to bear the same relation as a puzzle to the work of female inventors as does the car-coupler to that of the men with fresh thoughts—neither ever seems to be arrived at in a shape that is entirely satisfactory. Of such things as bustles, dress elevators, abdominal supports, and improvements in chemises, there is no end. Buttons and studs, as well as fasteners for them, appear to have taxed much feminine ingenuity; nor are such trifles neglected as novel blacking-brushes and blacking-boxes, folding soap-dishes, and combined scissors and tape measures. In the line of machinery pure and simple the women are shown, by the reports of the Patent Office, to have exhibited great inventive capacity. To sewing-machines they have paid most attention, the result being a long list of useful improvements, which are in general use to-day. Among them may be mentioned a needle that does not have to be threaded, and a device which renders it possible to thread the needle while the machine is running. Other remarkable mechanical patents of theirs are for electric lighting, noiseless elevated roads, apparatus for raising sunken vessels, sewing-machine motors, screw propellers, machines for weaving hair for wigs, agricultural tools, spinning-machines, processes for making paper pulp out of straw and wood, locomotive wheels, burglar alarms, and methods for destroying vegetation on railways. An Ohio girl has discovered a way of transforming a barrel of petroleum into ten thousand cubic feet of gas. Another fair genius has constructed a machine which will make as many paper bags in a day as thirty men can put together. Still another one has originated a safe for provisions, which is very appropriately adapted to the keeping of the high-priced spring vegetables just

now in fashion. Sisters in the new inventive craft have produced such interesting things as a bathtub and sofa combined in one piece of furniture, a bureau and bathtub, likewise a combined trunk and bureau, and a step-ladder that is an ironing-board in disguise. Another presumably fair inventress has patented an 'improved copyholder,' though it is only just to say that, from the newspaper point of view, the copyholder does not need improvement so much as does the proof-reader. A 'folding scaffold' is not designed for purposes of execution, but merely for windows. In the same collection of valuable feminine fancies are a life-raft, an impregnable chicken-coop, an adding machine, a portable summer-house, fly-traps, an improved see-saw, a model grain elevator on a new plan, a device for numbering houses, processes for imitating marble and stained glass, a method of preserving eggs, improved ladders, a rocking-chair that fans the person rocking, alloys to imitate silver, life-preserving garments, and a war vessel that is susceptible of being converted off-hand into a land fort by simply taking it apart. Who says 'women never invent anything?' Only last year there died here in Washington the woman, Mrs. Nancy Johnson, who in 1843 invented the first ice-cream freezer. Up to that time the tool used to make ice-cream was a big spoon. She was ninety years of age. The first woman patentee in this country was Mary Kies, of Connecticut—the State that has more inventors, in proportion to its population, than any other in the Union. Her idea was for weaving straw with silk thread. The notion of syllabic type was a woman's. But only a suggestion can be given here of the great contributions which petticoat genius has made to invention in the United States. Think how many women inventors there must have been who preferred to remain in the background, and permit their fathers, husbands, and brothers to appear as the authors of their creations! Consider, too, how much help the ladies—God bless them!—give the men in the development of new thoughts. If the famous Galvani's wife had not been sick, so that he was obliged to make frog-leg soup for her, the frogs would not have been lying on the table amid his electical apparatus; a live wire would not have touched the limb of one of the batrachians, setting the animal off into a frantic fancy dance, and galvanism would have remained for the time being undiscovered.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobsters, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

CELERY CONSOMME.—Clean two heads of celery and cut the stalks in inch lengths and cook them for a few minutes in sufficient butter to prevent burning; when they are colored add a pint of clear soup, simmer a few minutes, then add a quart more of the soup, skim off any floating globules of fat that may be floating on the surface, season and serve.

FRIED VEAL.—Take a piece of the forequarter of veal, remove the surplus fat. Put the whole piece in a saucepan and add a sliced onion, a sprig or two of celery tops, salt, and a liberal allowance of whole peppers; cover with hot water or soup stock and simmer until the bones can be easily removed, when it will be properly cooked. Placed between two platters, on top of which put a heavy weight and let it become cold. Strain the sauce to free from fat and hold it in reserve. Now cut the veal into neat pieces of the same size; dip them in beaten egg and bread crumbs, and strew over them a little salt and pepper; dip again in egg and again roll in crumbs; have on the range a liberal quantity of fat; when it is smoking hot, add the meat and fry to a delicate brown. Heat the sauce and add to it just enough sherry to give it flavor, thicken it with a little brown flour, taste for seasoning, and send to table in a boat.

POTATO CHEESE CAKES.—Bake three or four large mealy potatoes, and when well done turn out the insides. When you have half a pound rub it through a wire sieve. Beat up ten ounces butter with eight ounces sugar, add to them five well-beaten eggs, flavor with lemon; beat up very light, add the potato and bake in patty pans lined with paste. When done put an icing over them and stick a blanched almond in the centre. Eat them cold but when quite fresh.

SPANISH SAUCE FOR FISH.—Pound to a paste a little garlic and two red peppers that have been soaked for a moment in boiling water; add to the mixture a little water. Beat a cupful of sweet oil to boiling point with a tablespoonful of vinegar and a little salt. Add to this the pounded peppers and remove from the fire. In this sauce cook any kind of fish and serve it with it.

SPANISH SALAD.—Wash a head of lettuce and dry it carefully and thoroughly. Put in a salad bowl equal quantities of cold water and vinegar, a teaspoonful of mixed pepper and salt and four times as much oil as you have water and vinegar. Beat all together and add a small fresh onion chopped fine. At the last moment add the fresh crisp lettuce.

OATMEAL ROLLS.—Heat two cups of milk and to it add a good tablespoonful of butter, cool a little, then put in three cups oatmeal, one cup flour, a beaten egg, salt, and one-half yeast cake; knead the dough into a smooth mass and set over night. In the morning knead again, roll out and cut into rolls. Set away till very light, then bake.

ARROWROOT CUSTARD FOR INVALIDS.—One pint milk, one tablespoonful of sugar, one tablespoonful of arrowroot, one egg. Mix the arrowroot smooth with a little of the milk; put the rest of the milk in a saucepan and when it boils add the arrowroot, sugar and beaten egg, that have all been well beaten together, also very little salt. Stir the custard for a few moments, then cool.

OCEAN MYSTERIES.

THE REVELATIONS OF THE BOTTOM OF THE OCEAN.

The Hydrographic office of the navy is about to publish a descriptive account of the depths of the oceans, which until very recently have been considered in the light of mysteries most profound. Only a few years ago the bottoms of the great seas of the world were unknown and unexplored, and the abysses beneath their waters remained unfathomed. Such soundings as were attempted were made with ropes and crude apparatus, and away from the shallows "no bottom" was the record upon the charts. It remained for the ingenuity of this generation of mankind to map out the deeps, with their mountains, valleys and even streams. The mighty caves of ocean have been to some extent surveyed, and the very creatures that dwell in them have become newly familiar to science. If the ocean waters should be affected by a miraculously low tide, so as to sink as much as the height of the Washington Monument, an astonishing alteration would be made in the shape of the North American Continent, the line of the Atlantic's breakers receding so far that New York City would find itself more than one hundred miles from the sea, as would Boston likewise, and Savannah, Georgia. It would be discovered that the present shore of the Atlantic is not the edge of the continent at all, but that this edge is away out to the eastward, so that if it formed the coast, this country would be enough larger to make room for four or five new States. On the Pacific side it is quite otherwise. There the continent's edge is marked pretty closely by the shore line, and so abrupt and precipitous is it, that enormous depths are found close to land all along that coast, great submarine valleys lying along the very margin of terra firma. In starting to take a walk over the floor of the ocean, perhaps it would be as much fun as any other plan to set out from San Francisco, for a view of the Pacific's bed. For the first twenty-nine miles of the journey westward you will proceed over a level plateau formed of detritus which the river water has cast out through the Golden Gate for a thousand centuries. The depth of the sea for that distance is only about two hundred feet, but at the end of it the bottom drops suddenly to two and a half miles. To get to the foot of this tremendous hill is likely to be difficult, in as much as you must climb from a greater relative altitude, and by a much steeper incline, than that by which a traveller passes from the summit of the Sierra Nevada range to the valley of California below, at Sacramento. As you go down, you will experience a cold that becomes steadily more intense, and the pressure of water from above, which makes the cold, grasps you with such a mighty grip that your body would be crushed to a jelly in its fluid embrace, were you not protected by armor of immense resisting power. Without such an equipment, as well as a store of air, and a powerful light, there is no use in your attempting to explore the ocean's abysses. At the foot of the great declivity you will find a seemingly interminable plain, like a prairie. It is the beginning of the floor of the Pacific, which is for the most part so wonderfully level that you could drive over it with the utmost comfort in a light carriage, were the water all taken away. As you proceed westward, though the slope is so smooth and gradual that you do not notice it, the bottom descends on a slight incline, until, at five hundred miles from the land, the surface of the ocean is three miles and a quarter above your head. This is the normal depth of the vast Pacific plateau. You travel over it for another five hundred miles, when you come upon a gigantic mountain, which towers up from the ocean floor to the height of nearly three miles. Its existence has only been ascertained by soundings, because half a mile of sea-water flows over it. Beyond the mountain is the plain again. It is a dead level of shelly ooze, such as covers pretty much all of the ocean floor. The mixture, sometimes greenish and sometimes brownish, is partly detritus washed by rivers from the land, and partly shells of almost microscopic animals, called *foraminifera*, which fall upon the bottom in a gentle and continuous rain. All the chalk beds in the world are formed of such shells, and the very stones of which the Pyramids of Egypt were built are composed almost wholly of them. There is a certain monotony about the aspect of things in these enormous depths. One may well be oppressed, too, by the absolute silence which reigns. Frightful storms may be raging on the surface, but here, three and a-half miles beneath, all is as still as death, and not even the murmur of a wavelet reaches the ear. Everywhere, if you close your lantern, is the darkness of absolute black—a liquid darkness that makes itself felt by a pressure of two tons to the square inch. The water is so cold as to be very little above freezing point. On every side spreads

a desert of interminable extent, frightful in its desolation, with not a blade or sprout of any sort—nothing, in fact, but the shelly ooze, into which your foot sinks somewhat as you tread. Perchance there are a few sea-lillies in your path; but you know that they are animals and not of the vegetable nature, which they feebly counterfeit. You might follow the same dead level, now and then coming across an isolated elevation, all the way across to Asia, 10,000 miles farther, if you liked. Instead, you go southwest a thousand miles, until you come to a group of tremendous volcanoes, rising precipitously from the bottom, whose tops are called the Sandwich Islands. Thence three thousand miles directly south, and you find yourself entering a portion of the ocean plain that is comparatively mountainous. Many of the hills are tall enough to project out of the water, thus making islands large and small. You are exploring the sub-cellar of Polynesia, so to speak, and you find, as you travel westward past the Society, Navigator, Friendly, Fiji, and other groups, that the floor you are walking on still preserves its depth and evenness, save where in spots, vast shoals have been uplifted, of volcanic and coral-line formation, bearing such groups as these in the shape of sugar-loaf elevations high enough to supply habitations for man and incidental material for missionary enterprise. It is believed by geologists that once upon a time there were many more islands in the Southern Pacific than there are now, and that they have disappeared, owing to volcanic agency. Real estate in that portion of the world would not appear to be held on the most secure terms; it is always going down or coming up, a mountain one day being a hole in the ground the next, or vice versa. It was only half a dozen years ago that a peak two miles high rose in a single night out of the deepest part of the strait of Sunda, between Java and Sumatra. You go no farther south, because below the fortieth parallel of latitude there are no islands worth mentioning, and the ocean floor is nothing but a level and uninteresting plain, the water shoaling steadily toward the North Pole, so that the big icebergs in the Arctic and Antarctic regions are apt to be found aground. Passing northward along the deep valley which hugs the eastern shore of Australia, fringed with the most wonderful coral reefs in the world, you keep on up by the coast of China until you reach the point a few hundred miles south of Japan where is the only deep-sea abyss known that has never been sounded. The last attempt registered five and a-half miles and no bottom, because the apparatus broke. Other soundings have been made successfully, however, on the east of Japan, and it is known that along the coast of those islands and close in shore runs the deepest chasm in all the Pacific Ocean, and through this chasm rushes the great black stream, which corresponds to the Gulf Stream of the Atlantic. In the course of a journey across the Indian Ocean you are not likely to come across anything different from what you have already seen, though you might pause to open some selected oysters for pearls in the fishery waters of Ceylon. The bottom of this great sea is the same sort of interminable shelly plain, though somewhat less deep than the Pacific. Upon rounding the Cape of Good Hope, you are in a position to make a bee line for New York. It is a long journey, however. The conditions are not such as are most favorable to pleasant traveling. You find yourselves about three miles deep, surrounded by the same cold and silent liquid blackness. The desolation is profound, and yet you are not alone, nor have you ever been since you began your walk upon the ocean floor. These tremendous depths literally teem with life. There are multitudes of fishes more ferocious than anything that are known to shallow waters—all of them carnivorous, because there is nothing vegetable for them to eat, and they must prey upon one another. Most of them have huge goggling eyes, with which they come and gaze at you, having no fear, inasmuch as they have never seen man before. Their eyes are so big in order that they may catch every possible ray of light. It is true that in these abysses there is no light whatever that is of day; but for that reason, inasmuch as it is necessary to see in order to pursue their prey, these predatory monsters carry phosphorescent torches on their heads, with which nature has provided them. Some of them do; that is, while others have luminous spots upon their sides. These lights serve them not only for purposes of vision, but also as bait wherewith to attract victims. Some notion is had of the astonishing voracity of such fishes of the nethermost deep when it is understood that certain species can swallow other fishes ten or even twelve times as big as themselves, the glutton literally climbing over and around the one swallowed, first with one jaw and then with the other. Among the most extraordinary of the creatures is a fierce shark, which resembles an eel somewhat in shape. All of them without exception are as black as ink. Their bodies are pulpy, even their skeletons being soft, the great pressure of the water rendering them compact, although when brought to the surface with the dredge they are apt to burst and fly to pieces immediately, being relieved of the compression to which they are accustomed. Thus, making your way over the plain of the ocean, you find yourself surrounded and accompanied by inky monsters, all eyes and jaws, while around and about on every side pass silently the unending torchlight processions of the deep, the only color that relieves the gray monotony of the bottom being supplied by shrimp-like crustaceans, some of brightest scarlet and others of vivid orange yellow. In the distance, now and then, you may behold in a shadowy way vast and formless things of gigantic size, which for all you know may be survivors of races antediluvian, long since supposed to be extinct. On your way over the bed of the Atlantic to New York you may turn aside, perhaps, to look into one of the deepest sea holes that can be found in the world, immediately north of Porto Rico, where the ocean floor takes a sudden dip into a gulf more than five miles below the surface of the water. It is extraordinary how these West Indian islands rise precipitously from the depths, uplifting their mountains miles high out of the sea. South of Cuba, in the Caribbean Sea, is a hole much bigger than the one north of Porto Rico, which forms an elongated valley nearly six and a half miles deep. This is believed to be the deepest of all the valleys of the ocean. Among other surprising things, you would come across the Bermudas, may be, nine hundred miles due east from Charleston, which are the peaks of mighty hills rising abruptly out of the midst of the great flat ocean plain. Upon reaching the edge of the North American continent, about one hundred and fifty miles southeast of New York city, after a pretty steep climb from the three-mile depth, you find yourself in the shallows, following the line of a tremendous gouge six hundred feet deep which the Hudson River has cut out in making its way to the ocean beyond. All you have to do is to pursue this until you find yourself at the foot of Manhattan Island, where you will doubtless consider it a relief to get upon dry land again and seek the nearest first-class hotel.—*Transcript.*

ESCANABA.

THE GREATEST IRON PORT OF THE WORLD.

Escanaba is the county seat of Delta County, Michigan. It lies at the foot of the great pine forests, and overlooks Little Bay de Noquet, the headquarters of Green Bay. Five years since, it was practically a village in the wilderness. To-day finds it a city with a population of 8,000, lighted by electricity, having a well equipped fire brigade, water works with a capacity of 4,000,000 gallons per day, a high school and three other schools, six churches, three newspapers, a railway station where 216 trains arrive and depart daily, and it will shortly have an electric street railway in full work. Its annual retail trade is estimated at $3,000,000, and its wholesale trade, including iron ore, pig iron, lumber and coal, at about $25,000,000. According to Mr. Nursey's carefully written report, capable of the fullest verification, Escanaba is the greatest iron port in the world. He tells us that during the navigation season of 1890, it shipped 3,700,000 tons of iron ore, or nearly double that of all the ore ports of Michigan, Wisconsin, and Minnesota combined. Its lumber output amounted to about 120,000,000 feet, while the freight capacity of the vessels entering and clearing from its port exceeded 8,000,000 tons. This compares with the tonnage of the greatest seaports of the world, which are: (1) London, 19,000,000; (2) Liverpool, 14,000,000; (3) New York, 11,000,000; and next comes Escanaba with 8,000,000 tons.

WINE DESTROYERS.

GRUBS BORE INTO THE CORK AND RUIN THE CONTENTS.

"A subject that has recently engaged the attention of European entomologists is of great interest to the wine producers of our State," said a prominent vineyardist recently to a San Francisco *Chronicle* reporter. "Investigation among the vineyards in France proves the existence of two or three types of moths in wine cellars. These moths, it appears, thrive in damp cellars. It is said by the scientists that the moths lay grubs, which feed on the fungoid growth that forms on the wine vats and moldy corks. The insect bores and forms galleries in the cork nearest to the glass, and through the holes thus formed air gains access to the wine, spoiling it in many instances. Our chief difficulty in bottling wines has been in obtaining a supply of perfect corks. At least 25 per cent. of corks, after examination for fitness, are rejected. As soon as we heard about the discovery of these insects an examination of several bins was made at the vineyards, and while our cellars are in no way damp or moldy, we found that the corks were perforated, and that in some cases the wine oozed through them. Now we are trying a method to stop the inroads of these grubs. After soaking the corks in hot water and then in brandy they are dried, and when they are put into the bottles, the tops are coated with a layer of paraffine wax previous to sealing them with ordinary wax. We hope by the use of the paraffine compound to stop the ravages of these insects. Neither the grubs nor insects feed upon the wine, but simply use the cork as a place to deposit their eggs, and the coating may possibly prevent their entrance. This method of manipulating the corks is worthy of trial by all our California wine growers, and if successful will materially aid in promoting their interests."

LIQUID GLOBULES.

WHY DOES A DROP OF WATER TAKE A GLOBULAR SHAPE.

By striking the surface of a pond obliquely with an oar, a shower of drops will be thrown up. Most of them will, when they fall, reunite at once with the sheet of water below. But some of them will not do so, but will float and roll rapidly about, looking like little spheres of quicksilver. These globules will, after floating a longer or shorter time, suddenly disappear, and leave no sign save a tiny ripple. Although these water balls are such common objects, yet they are well worth the student's attention. He can manufacture them at will, and in a manner convenient for observation, by taking, instead of a pond of water, a china saucer filled with kerosene oil. The tension of the skin which all fluids seem to exhibit, and which accounts for the floating globules, seems to be greater in the case of

the oil than in water. With the aid of a rod of wood the size of a pencil the apparatus is complete. By dipping the rod in and out we may obtain an abundance of the globules whose antics we are to study. The first thing which attracts attention is, that often when only one drop of oil has fallen from the end of the rod we see two globules floating, and also, we observe, that one of them is much smaller than the other. This is accounted for in this manner: As the forming drop receives accretions from above, it elongates until the accumulating weight becomes too much for the cohesion of the particles of oil, and it breaks away. But it does not break off smoothly, but draws after it a tail like the stem of a pear. This stem then separates from the larger mass below, and both form themselves into spheres. The first and larger drop falls upon the fluid beneath, and swims thereon. The smaller drop falls upon the larger, and rolls rapidly down its side and away. Thus we account both for the two drops and for their disparity in size. We next observe that when two spheres approach sufficiently near they seem to be attracted by each other, and will coalesce into one larger globule. The question naturally arises, Why should the tension of the globules be sufficient to keep them from joining the fluid beneath, but not to prevent them from joining each other? The reason seems to be that each globule swims in the bottom of a cavity, or depression, which is equal in bulk with the globule. Now when two globules approach each other their depressions will begin to coalesce, and the globules will be driven toward each other, or, in other words, will roll down hill to the centre of their combined depression. This shock combined with the fact that the opposing surfaces of the two spheres are very small) forces a rupture of their skins, and a juncture of the two results. We next observe that a ball will sometimes appear to suddenly shrink to a fraction of its former size. This is a rather uncommon behavior, but diligence will reward the student with this, at first sight, inexplicable phenomenon. If we watch attentively the behavior of a ball when it bursts, we will see that there is always an attempt to reproduce itself upon a smaller scale, after the following fashion: If we throw a bullet into a pond of water, it, in sinking, first sends out a wave; then, as it falls down, it leaves a cavity, and the water, rushing in to fill up the depression, meets at the centre, and a column of water is projected upward. The same process happens on a small scale when a water ball coalesces with the fluid below First a wave is driven outward; then, as the globule sinks, it forms a depression. The fluid then rushes in: a minute column is projected upward, and divides into one or more fragments, which, upon falling back, sometimes assume the spheroidal condition and float—all being done so quickly as to leave the impression that the first globule had shrunken to its latter condition.—*Popular Science News.*

WISE SUGGESTION.—A timely suggestion has been offered by a German physician that the date of original preservation be stamped upon each and every can or package containing meat foods. It is held that preserved meats, hermetically sealed, may remain wholesome for a year or so, but that there is danger in the use of such foods after this period.

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

JOHN DUNCAN'S SONS. NEW YORK.

FOREST AREA.—The total forest area in the United States is estimated at 481,764,599 acres.

LONG WHISPER.—The most novel of the late telephone inventions has a glass diaphragm resting on glass rods, and communicating with the ordinary wire. It is claimed that a whispered conversation has been carried on intelligently over a distance of three miles on the trial instrument.

COMBINED EFFORT.—More than 300 different industries, says the *Southern Lumberman*, enter into the building of every ocean steamship. To build a 2,500 ton steamship requires 600 men in direct and constant employment, averaging $500 per man. The sum of $300,000 is thus distributed to the trades.

PRUSSIAN LONGEVITY.—Statistics of longevity just published by the German Government show that in 1888 there were ninety-one persons in Prussia who were over a hundred years old, and between 1864 and 1888 upwards of seven thousand persons of over a hundred died, and of these one hundred and fifty-five were more than one hundred and nine.

NO USE FOR A HUSBAND.—A Williamsport girl, who in the matter of beauty and affectionate exuberance was not to say "fresh as first love and rosy as the dawn," was asked why she did not get married, and this is what she said in reply: "I have considerable money of my own, I have a parrot that can swear, and a monkey that chews tobacco, so that I have no need of a husband."

IMPORTANT INVESTIGATION.—The Committee on Public Health of the Massachusetts Legislature recently passed a resolution that the State Board of Health should undertake an investigation into the dangers to human life and health arising from tuberculosis in the food products of cattle. It was recommended that authority be given to spend a sum not exceeding $15,000 on the inquiry."

GERM MULTIPLICITY.—Dr. Dowd, of New York, has been making a careful study of the number of germs found in the soil, which is known to be everywhere swarming with these minute organisms. The number of germs present in a cubic inch of soil was found to vary from sixty thousand to two and one quarter million.

HANDY MEASURE.—An ingenious device for measuring distances, and which will be likely to interest architects and builders, is an invention of an English firm. It consists of a small revolving wheel which operates a spindle, the revolutions being accurately registered by a dial counter. By running the distance wheel along a wall or other surface the recorder will show how many feet have been measured. There is practically no limit to the distance that may be determined by this little device.

FINGER NAILS.—A eminent German bacteriologist has recently been studying the impurities found under the finger nails, and has discovered abundant evidence to support popular idea that there is something particularly poisonous about the scratch of the nail. In seventy-eight examinations made by the authority referred to, more than fifty different kinds of germs, besides various sorts of mold spores, were found present. These experiments emphasize the necessity of frequently and carefully cleaning the finger nails.

INSURANCE AND ELECTRICITY.—The prejudice that seems so often to be carefully worked up against the electric light on the ground of danger from fire is found bottomless wherever there is the least regard for ordinary precaution, as with every other agent of use to man. Several thousand houses in Philadelphia have the electric light, and the inspector there in his last annual report states that there was not a single fire or a single dollar lost. Still more striking is the evidence from the electric light companies themselves. Until about a year ago, fire companies refused to insure central stations except at ridiculously exorbitant rates. The station took the matter in hand and formed a mutual company. The showing is simply magnificent, and the company is on solid basis, while insurance from outside is now offered them at the ordinary rates. The mutual company, moreover, is setting a high standard of construction, so that its losses should tend steadily to a minimum.

IMPERIAL GRANUM is the favorite food for children and invalids.
The Medical World, Philadelphia, Pa., May, '90.

IMPERIAL GRANUM is a good and well made powder of pleasant flavor. * * Contains no trace of any impurity.—*The Lancet, London, Eng., July 12th, '90.*

IMPERIAL GRANUM is a food that has attained a high and standard reputation by the merit of actual use for a long period of time.—*Medical Summary, Philad'a, Pa., July, '88.*

IMPERIAL GRANUM has withstood the test of time, and is to-day unexcelled by any dietetic preparation on the market.—*Medical & Surg. Jn'l, Atlanta, Ga., Feb. '89.*

IMPERIAL GRANUM has been before the public for many years, and is admitted to be a standard preparation. There can be no doubt that this is due to its uniformly superior quality, and the successful results obtained with it in all cases where a prepared food is required.—*Popular Science News, Boston, Feb. '88.*

IMPERIAL GRANUM is one of those carefully and conscientiously prepared foods that never disappoint the doctor in its administration. We have never seen a stomach that could not retain it, no matter how inflamed it might be. It will at once be seen what a valuable aid this is to the physician in the treatment of all the graver forms of gastric diseases.—*The Prescription, Feb. '91.*

IMPERIAL GRANUM has been on the market for many years, and its sales are constantly increasing. The greatest possible care is used in its manufacture, as we can testify, having visited the factory. Absolute cleanliness prevails, and the greatest care is taken to have the product absolutely uniform. The fact that physicians almost universally recommend it is sufficient proof of its standard quality.—*The Christian Union, New York, July 4, '90.*

Twenty-seven years ago last June IMPERIAL GRANUM was recommended to us by one of the leading physicians of Cincinnati, for a child whose life had been despaired of. We believe it saved the child's life, and it has been one of the articles necessary to have in the house ever since that time, and we have found it equally efficacious for the invalid and aged. It has steadily increased in popularity during all these years, and is to-day commended in the highest terms by leading physicians all over the world. There is probably no article on the market that receives so much care and attention in every detail of manufacture.
The Christian at Work, New York, Aug. 21, '90.

SOLD BY DRUGGISTS. Shipping Depot, JOHN CARLE & SONS, New York.

A LIGHT METAL.—It must be remembered that $1 a pound aluminum is really not so high as it looks, for the relation of a pound of aluminum to a pound of other metals is something like that famous pound of feathers to the pound of lead. Aluminum is almost three times as bulky as iron, weight for weight; it is nearly four times as bulky as silver and more than seven times as bulky as gold.

HIGH, BUT CHEAP.—Chicago will soon have the largest ten-cent lodging house in the world. The building will be seven stories high, will cost $85,000, and will be heated by steam and lighted by electricity. Each of the 360 rooms will be 7 by 6 feet, provided with iron bedsteads and hot and cold water. The floors will be of tile and the wainscoting of marble.

LARGE UMBRELLA.—The biggest umbrella in the world has been made for the use of a West African king. The umbrella, which can be closed in the usual manner, is twenty-one feet in diameter, and is affixed to a polished mahogany staff of the same length. The canopy is made of India straw, lined with cardinal and white, has a score of straw tassels and a border of crimson satin. On the top is a pine-shaped straw ornament which terminates in a gilded cone. When in use the umbrella is fixed in the ground, and under its shelter the king is able to entertain thirty guests at dinner.

THE CENTURY DICTIONARY

comes nearer to being a complete catalogue of the English language than any dictionary ever published. But it is not merely a dictionary: it is an encyclopedia of common things as well. It has been ten years in preparation. The leading scholars of the country have contributed to its pages. It is the latest dictionary and it ought to be, and is, the best.

A large descriptive pamphlet containing full-size sample pages, etc., will be mailed to any one sending five 2-cent stamps to
THE CENTURY CO., 33 East 17th St., New York.

A LARGE AND VALUABLE

Cook Book Free

We are enabled to offer our readers a most attractive combination, by which all may obtain a copy of the "Modern Cook Book" absolutely free. This handsome and valuable Cook Book has

320 Pages, Over 1,200 Recipes and Hundreds of Illustrations.

The recipes are the choicest selections from 20,000 that were received from practical housewives living in all parts of the United States, to which were added hundreds of the newest, best and most practical recipes of this progressive age, all of it set in new and large type, and the whole book handsomely illustrated.

IT HAS A BEAUTIFUL, ILLUMINATED COVER.

It is an elegant and admirably arranged volume of recipes for practical, everyday use. Among its points of excellence are the following:

Practical Suggestions to Young Housekeepers, Necessary Kitchen Utensils, Suggestions and Recipes for Soups, Fish, Poultry, Game, Meats, Salads, Sauces, Catsups and Relishes, Breakfast and Tea Dishes, Vegetables, Bread, Biscuit, Pies, Puddings, Cakes, Custards, Desserts, Cookies, Fritters, etc. Also for Preserves, Candies and Beverages; Cookery for the Sick, Bills of Fare for Family Dinners, Holiday Dinners, etc. A Table of Weights and Measures; Chapters on the Various Departments of Household Management and Work.

IT WOULD BE CHEAP AT $1,

As it is the Latest, Best and Most Practical Cook-Book Published, More Nearly Meeting the Wants of American Homes than any other.

Any person accepting our offer will receive this paper one year, and also that charming home journal, the Ladies Home Companion, one year, together with the Cook Book, all mailed, postpaid, for less than the regular price of the two papers alone.

The Cook Book is offered absolutely free to induce thousands of our readers to become acquainted with the Ladies Home Companion, the publishers looking to the future for their profit, as they believe you will always want the Ladies Home Companion if you try it one year. Do not lose this opportunity to get the newest and best Cook Book free.

THE LADIES HOME COMPANION is a large and popular 16-page journal, published **twice a month,** and gives information about those things which ladies particularly wish to know, and is mostly written by ladies. **Original or Selected Stories** by eminent authors are found in each issue. A special feature is the variety of departments, each of which is conducted by a special editor. It gives the latest **Fashions,** arranged for practical use; timely hints to **Housekeepers;** cheering and helpful talks with **Mothers;** valuable information for lovers of **Flowers;** a pretty and pleasant page for pretty and pleasant children. All handsomely illustrated. It is not an ultra fashion paper, but a journal for the home circle, full of common-sense ideas and suggestions for home happiness and comfort.

☞ **OUR OFFER** Send us $1.00 and you will receive **The American Analyst** one year, and also the **Ladies Home Companion** one year (24 numbers). And every one accepting this offer will also receive the above Cook Book, postpaid.

This offer is extended to **all** our subscribers. Subscribers whose subscriptions have not expired, or those recently renewed, are privileged to accept this GREAT OFFER, in which case their term of subscription will be extended one year.

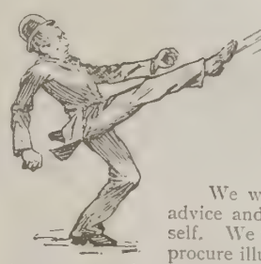
Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.



The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

Don't kick

because your business is bad, but advertise If you don't know how to, write to us and we will tell you.

We will prepare your advertisement or give you advice and assistance to aid you in preparing it yourself. We will have the advertisement set in type and procure illustrations if any are needed. When a satisfactory advertisement has been produced we will furnish proofs and an electrotyped pattern to be used in duplicating the advertisement if the display or illustration make an electrotype desirable.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

FROM FARM TO KITCHEN.

The United States census office has recently issued some highly interesting statistics of truck farming in the United States, as distinguished from market gardening, which is conducted so near to the local market that the farmer depends on his own team for transportation. The average truck farm is situated a great distance from the market in which its produce is disposed of. It is a new feature introduced within the last few years, except the little which used to be possible by canal. It is the modern railroad that has rendered possible the truck farm, and this partly accounts for the fact of its neglect in previous census compilations. Not that there was no truck farming in 1880, but the volume of it was vastly less than now. It is estimated that upward of $100,000,000 is invested in the industry in the United States, the annual production being three-quarters of this amount, or $76,500,000, realized from 534,440 acres of land. In the work are engaged 216,765 men, 9,264 women and 14,874 children, who are aided by 75,868 horses and mules, and use nearly $9,000,000 worth of agricultural implements. The industry is carried on in nearly all the States, but the principal districts are a narrow belt on the South Atlantic coast and along the Mississippi Valley. The more fertile soils are chosen, labor and the railroad do the rest. The big cities are the best customers of the truck farmer, the wants of the people in the smaller centers of population being to a large extent supplied from the immediate neighborhood, and they take less per capita of that grown in other climates than their own. The vast increase to human comfort permitted by the enjoyment of the products of other areas than those which surround the consumer, and the concomitant benefit to the many who in this direction minister to the supply of what may be called necessary luxuries to their fellow creatures are the outgrowth of the present generation, which, by making railroad transportation far-reaching, speedy and cheap, has permitted the interchange of commodities on a scale that would never have been dreamed of by the people of fifty years ago.

ELECTRIC EXHIBITION.

A novel and instructive entertainment is to be initiated in the city of Frankfort-on-the-Main on the 16th of the present month in the shape of an International Electro-Technical exhibition. An explanatory circular that has come to hand announces that the exhibits will be in twelve classes. At the principal entrance of the main exhibition the historical division will illustrate the development of the telegraph and the telephone from the beginning. As the Imperial Government has placed its present apparatus, as well as its museums, at the disposal of the directors, this division is expected to be complete beyond anything of the kind before attempted. The telephones will be connected with the grand opera houses in Frankfort, Munich, and Wiesbaden, as well as with concert halls in distant German cities, so that every evening visitors may hear the best music of the artists of western Germany. The second division will contain examples of all such electric signals as are used on railways, on ships, in mines, and in the army. The exclusively marine features of this department will be in the marine exhibition on the Main. Two electric boats, one of which carries 200 persons, will ply on the river, which will be illuminated with an enormous electric light tower. A picturesque and popular part of the marine exhibition will be a waterfall, forty feet high, in a grotto lighted with electricity. Beyond the departments of electro-metallurgy and kindred industries the electro-medical and scientific apparatus will be grouped. All the results and means of Prof. Hertz's celebrated experiments in the nature and essence of electricity will be shown there. The space around the centre of the main exhibition will be occupied by the machinery hall, with its sixty motors of 4,000-horse power. Two or three motors of 500-600 horse-power each will be operated in the hall. An experiment in the transportation and distribution of electric power is awaited with keenest interest. A factory in Lauffen, 105 miles distant, has undertaken to furnish from that place 300 horse-power with which to operate lights and machinery. All sorts of industries, such as shoemaking, joinery, and dairying, will be prosecuted on the grounds. Every kind of an electric street railway will be in operation to convey visitors to and from the exhibition.

THE PHOSPHATE INDUSTRY.

We find in a recent issue of our Baltimore contemporary, the *Manufacturers' Record*, a full and interesting narrative of the development of the phosphate mining interests of Florida and South Carolina. Since 1889, when one company commenced to mine phosphate rock in Florida on a small scale, this industry has developed with wonderful rapidity, and the investments in phosphate lands have been on an enormous scale. The *Manufacturers' Record's* list of companies now operating there shows that over $12,000,000 has been invested within two years and that these companies now have a daily capacity of 2,000 tons of phosphate rock, which will be increased shortly to 3,000 tons by the completion of mining plants now under construction. In addition to these companies, fifty-one others, with an aggregate capital of over $21,000,000, have been incorporated to develop phosphate lands, but are not yet at work. In South Carolina there are twenty-eight phosphate mining companies, with an aggregate capital of $4,510,000, and the production last year was 537,149 tons. There are also eighteen fertilizer manufacturing companies in that State, having a capital of nearly $5,000,000.

THE EARTH'S CRUST.

A curious work is that which we read in the daily papers the government geological survey has undertaken—it is digging the deepest hole in the ground which has ever been attempted by man. This extraordinary aperture is located in the neighborhood of Wheeling, West Virginia. It is eight inches in diameter and has now reached a depth of 4,100 feet, or nearly one mile. No difficulties in boring have yet been encountered, and the work will be continued so long as human skill can devise means of going deeper. Interesting geological discoveries will doubtless be made, but the principal object of the survey is, if possible, to reach a depth that will throw some light on the question of the proximity of interior fires to the surface of the earth. Whatever may be the final results, the progress of their work thus far is rather reassuring. If no signs of fire can be discovered at the depth of a mile we should be willing to take the chances against an early terrestrial combustion.

HOSPITAL EXAMINATION.

An open competitive examination of candidates for Junior Assistant and Female Physicians in the New York State Hospitals for the Insane will be held by the State Civil Service Commission at the Capitol, in Albany, June 11th. Candidates must be residents of the State, and must have had one year's hospital experience, or three years' experience in the general practice of medicine.

GERMAN COOKERY.

A GLIMPSE INTO THE NATIONAL DISHES OF THE WORLD.

There are so many characteristic and interesting dishes peculiar to the German speaking races of Europe, that it will be necessary to devote two numbers of this series to the setting of them forth. In the first of the two will be considered the most substantial dishes, the heavy artillery of the dinner-table—meats stewed, braised and roasted; poultry, sausages, soups and so forth. In the second, the lighter brigade of puddings, cakes and entrées. German cooking methods—it is useless to deny it—have not found favor with the neighboring nations. With kitchen matters race has much to do, also those evolutionary processes that accompany civilization. Cooking in Germany is not abreast of that of the rest of Europe. Literature itself in Germany in its higher development is hardly a hundred years old, and it is not to be supposed that the sister art is more advanced. Lessing, Schiller and Goethe were the pilots and pioneers of German literature, but there has never been a German Carême or Vatel to show the way from barbaric roasting and seething to the refinement of sauces and *ragoûts*. Race, too, must tell. The keen Celtic sensibility which Mr. Grant Allen has been dwelling upon is employed when the Celt is a *gourmet* in culinary criticism, and that "magic" which Matthew Arnold found in the works of the great Celtic writers is found also in such works of the great Celtic *chefs* as their *supremes de Volaille*, their *epigrammes d'agneau*, and their *vol-au-vents à la financière*. In Germany this delicacy, lightness of touch, and, so to say, "magic" is altogether wanting. On the other hand, the German has a strength of imagination which has done great things in many domains. It is the Gothic strain, romantic, sombre for the most part, or grotesque with a Macabrie humor. It is needless to recount the outcome and triumphs of this great faculty of the German mind and heart in painting, in sculpture and in letters. In the kitchen, it must be admitted, that at times it runs riot. The most incongruous ingredients, which cooks of a colder fancy would almost shudder to combine, are poured into one saucepan, and result in compounds at the bare contemplation of which the outer world of non-German grows pale. Beer is poured into soup with carraway seeds; apples and sausages and currants are fried together and bedewed with claret; and, as if it were not enough to eat such strange dishes, the greatest of German statesmen habitually washes them down, so it is reported, with champagne in which brandy has been poured, or porter tempered by port wine. These surely are neither the meats nor the drinks of a weakling nation. Notwithstanding the apparent violence of some of these modes of coction, the dish is mostly better than the recipe, and some of them, hereafter to be set down, deserve to be widely known.

KLARE SUPPE MIT PARMESAN CROUTONS (CLEAR SOUP WITH PARMESAN CROUTONS).—Celery, turnips, carrots, green leaks or onions, and young cabbage-leaves, all cut in strips, are put in a stew-pan with a piece of butter and a little sugar, covered close, and left to stew in their own steam over a slow fire. Shake them occasionally till soft and yellow. If the vegetables are not quite young, they must be previously parboiled, else they impart too strong a flavor to the soup. Boil the vegetables thus prepared in good gravy soup, and then strain them away. Take slices of stale roll, and, with a small round cutter, no bigger than a shilling, cut out little cakes, dip them in hot butter and roll them in grated Parmasean cheese. Bake them a bright yellow color. Throw these croutons into the soup at the moment of serving.

FISH SUPPE, WEISSE (FISH SOUP, WHITE).—Use any kind of fish; wash it well and set it on the fire in enough cold water to cover it. Add a small stick of celery, an onion or two, a few sprigs of parsley, a bay leaf, six cloves, and a spray of ginger. Cover close and leave it to simmer for an hour; then add sufficient water for the quantity of soup required. Let it all boil up together, strain it, add a cup of cream, and add salt and white pepper to taste. Fry as many eggs in butter as there are people at table; lay them in the tureen, pour over the soup, and serve with small toasted or fried sippets of bread. This soup may be made brown by leaving out the cream, using black pepper instead of white, and adding a browning, made in a stew-pan, with butter, sliced onion and flour; toast some very thin slices of bread a dark brown and put them in with the browning. Finish the soup as above.

KLOSTER WEIN SUPPE (MONASTERY WINE SOUP).—Boil a quarter of a pound of rice in a pint and a half of water until quite soft, and with it the thin yellow rind of a lemon. Add, by degrees, a bottle of any white wine. Sweeten with three or four ounces of sugar, and whisk in the yolk of four eggs when ready to serve.

BIER SUPPE MIT KUMMEL (BEER SOUP WITH CARRAWAYS).—A couple of rolls or small slices of brown bread must be boiled soft in a little water, then strained and beaten smooth. Add grated lemon-peel, sugar, spice, a large teaspoonful of carraway-seeds and three pints of ale. Boil all together, and, when ready for serving, pour the soup into a tureen, in which are the beaten yolks of four eggs, into which it must be stirred briskly.

SCHAUM MILCH SUPPE (FROTHED MILK SOUP).—Pound six bitter almonds and boil them in two quarts of milk; or, instead of the almonds, use half a stick of vanilla. Add sugar to taste and a little salt. Beat separately four eggs; the whites must be whisked to a stiff snow, then mixed with the yolks. Let the milk just cease boiling, and whisk in the eggs till it froths well; but this must not be done over the fire or the eggs will curdle. Serve with small sponge biscuits.

PANADA SUPPE (PANADA SOUP).—Cut three or four rolls in slices, and put them on the fire in cold water. When the bread has boiled a few minutes, pass it through a sieve, and set it again over the fire. Beat three ounces of butter to a cream, and add it to the panada when it boils, stirring it well in. Take it off the fire and stir in the yolks of four eggs, beaten with a half a pint of cream or milk, a little nutmeg and salt. It must not boil again.

PFLAUMEN SUPPE (PLUM SOUP).—Brown some flour in butter, stir in water to make it thinner, and put in plums, with some cinnamon or cloves. Let them boil to a mash, strain them, and add sugar with equal parts of wine and water, a pint of each to a pound of plums. Throw in a few whole plums, and simmer again till these are soft, but not broken. Add slices of toast a minute or two before serving. Cherry soup can be made in the same way, and is improved by breaking some of the stones and putting the kernels into the soup.

GEBRATENER HECHT MIT SAURER SALUE (BAKED PIKE WITH SOUR CREAM).—Cut the pike into neat slices and place them in an earthen baking dish with some butter at the bottom of it. Divide two bay leaves into pieces, and put them, with slices of onion, between the pieces of fish. Strew with salt and pour over half a pint of sour cream. Bake about twenty minutes in a quick oven, basting at intervels. Then strew over some fine bread crumbs, and grated Parmesan cheese; bake a few moments more until delicately colored. Dish the fish without breaking the slices, but take away the bay leaf and onion. Pour enough stock or hot water into the baking-dish to make a sauce; add pepper, sauce, lemon juice or vinegar; stir it well round the crusting and pour over the fish.

FORELLEN (TROUT).—To boil these, as indeed several other kinds of fish, put vinegar, sauce, sliced onion, bay leaf, spice and pepper into the water. Let this boil to get the flavors from the bay leaf, etc.; set it aside to cool a little; then lay in the fish and simmer slowly till done. Garnish and serve with any approved sauce.

SARDELLEN BUTTER (SARDINE BUTTER).—Wash a dozen sardines quickly in cold water, scrape off any scales and take the bones out. Pound the prepared fish in a mortar with a piece of fresh butter, adding by degrees more and more butter till half a pound is mixed in. Add some cayenne pepper and plenty of salt, and work the whole into a smooth paste, which must then be pressed into a jar or small potting-pan. If the sardines in oil are used they need not be washed; only the fresh fish need that. Sardine butter is excellent for sandwiches or spread on toast. Anchovies may be prepared in the same way.

SAUERBRATEN, OR ESSIG SCHMORBRATEN (SAVORY ROAST BEEF).—Lay a piece of beef in a deep dish, and pour a cup of vinegar over it. Let it remain in this form two or four days, turning and basting it every day. To prepare it for cooking, wipe it dry; cut strips of fat bacon the size of a little finger, roll them in a mixed seasoning of salt, pepper and pounded cloves. Make holes in the beef with a large skewer, and put in the pieces of bacon. Make some butter hot in a stew-pan just large enough to hold the beef; put the meat in and set it over a brisk fire, letting the steam escape to hasten the browning. Dredge it with flour, and turn it when one side is brown. When the meat is nicely colored, add about a pint of water, a couple of carrots quartered lengthways, a large onion or two sliced, two or three bay leaves, a teaspoonful of whole pepper, a blade of mace, the quarter of a lemon rind and a good sprinkling of salt. Cover closely, and let it steam slowly from two to three hours, adding a little water when necessary. When it is ready for serving, take the meat out of the stew-pan, and keep it hot while the fat is skimmed off and the gravy strained. The unbroken carrots may be laid round the meat. If the sauce requires to be more acid, add lemon juice or vinegar, thicken it with a little flour, give it a boil up, pour a little over the meat, and serve the rest in a sauce tureen.

GEFULLTE KALBSBRATEN (ROAST VEAL STUFFED).—Have a good fillet or loin of veal; beat it well, and rub it with salt. Make a forcemeat with half a pound of veal, half a pound of bacon minced fine with a small onion or shalot, a few sprigs of parsley, an ounce of capers, some grated lemon-peel, a little finely-powdered thyme or very little winter savory, a small cup of bread crumbs, salt, pepper and the yolk of three eggs. With this fill the most suitable part of the fillet or loin, and put the meat into a deep stew-pan with rashers of bacon under and over it, or rashers of bacon under and pieces of butter on the top. Let the meat brown on all sides, then add rather more than half a pint of water and an onion with six cloves stuck in it. Baste the meat often till thoroughly done. Should the steam at first retard the browning, do not keep the cover close, but it must be kept on after the water is put in. Skim and strain the gravy for serving with the meat.

GEBACKENE HUHNER (FRIED CHICKEN).—Young chickens only can be used for this. They should be washed clean and cut up, if small, into four, and if large, into six parts. Season with salt and a little pepper, roll them in flour, egg and breadcrumb them, and fry. Garnish with fried parsley, and serve. They may be eaten with mayonnaise sauce, which should be sent up in a sauce-tureen.

BRATWURST MIT APFELN (SAUSAGES WITH APPLES).

—Peel and core six or eight large apples, cutting each one in four quarters only; strew sugar and a little powdered cinnamon over them, and let them stand for two or three hours. Wash two ounces of currants and leave them to swell in warm water. Make a piece of butter hot in a stew-pan, and lay it in a pound of sausages, having first pricked them all over to prevent their breaking. Lay the apples between and on the sausages, and sprinkle the currants over. Cover close and let them fry gently. Turn the apples carefully when one side is done, and when they are quite cooked take them out and keep them hot. Turn the sausages until well done, then pour a wineglass of claret into the stew-pan; stir it round the crusting and make it hot. Dish the sausages in this sauce and lay the apples neatly round them.

KARTOFFEL SALAT (POTATO SALAD).—Small potatoes, which are wasteful to peel and cook with larger ones, should be sorted out for salads. Boil them in their skins, and while warm peel and slice them thin. Mince chilies, parsley or onions very fine, and strew it over the potatoes in the salad bowl. Sprinkle them with salt and pepper, pour over two or three spoonfuls of oil, and moisten the whole with vinegar and water mixed, that it may not be too sour. Several things may be mixed with the potato salad to give it flavor and variety, but only one should be added and mixed with the potatoes before the oil and vinegar are put in. Slices of pickled beetroot, a fresh cucumber, a Dutch herring cut up small, or a few sardines mixed may be used with advantage.

HÄRING SALAT (HERRING SALAD).—No precise quantities or proportions can be given for this excellent and favorite salad, as the ingredients may be varied according to taste. Good, white barrelled herring must be chosen—the Dutch are best. Lay them in water or milk for an hour or two to take out the salt, then open them, take out the bones, and cut them in small, thin slices, or chop them. An equal quantity of finely-minced cooked veal or other white meat is often added to the herring. Stir a small piece of butter to a cream, add to it some white or cayenne pepper, mustard, a little white sugar, oil and vinegar. Have ready, for a salad of two herrings, half a dozen potatoes, boiled and cold, as for potato salad. Cut them into small dice, and also some sour juicy apples, about as much in proportion, when minced, as the herrings. First stir the dressing well in with the fish, then the apples and potatoes lightly. The salad should be a little moist; if too dry or too sour, add some milk, or a little stock or broth. Some chopped chives or shalot is an improvement if the flavor is not objected to.

EARTH'S LAST DAY.

CAMILLE FLAMMARION GLANCES A FEW MILLION YEARS AHEAD.

The earth had been inhabited for about twenty-two million years. The primordial age had taken not less than ten million years to go through its several phases. The primary age had occupied more than six millions; the secondary age two million, three hundred thousand years; the tertiary age, half a million years; the primitive human age, the time of national divisions, of barbarism, and of militarism, had filled about three hundred thousand years, and the sixth age, that of intellectual humanity, had reigned for nearly two million years. During that long succession of ages the earth had grown older, and the sun colder, and in consequence the geographical aspect of the globe had metamorphosed itself, the water of the ocean had slowly penetrated through the earth's crust; the sea was contracted to a fourth of its area in the early human period; warm valleys and equatorial regions alone were habitable. All the rest was frozen. From century to century, humanity had attained forms of exquisite beauty, and no longer worked materially. A network of electricity covered the globe, producing at will all that was needed. It was then a unified race, entirely different from the rude and heterogeneous races that had characterized the first period. About the year 2,200,000 after Jesus Christ, the last great focus of human civilization shone in the centre of equatorial Africa, in the brilliant city of Suntown, which had already several times been raised again from its ashes. The sites where Paris, London, Rome, Vienna, and New York had stood were then buried beneath the ice. The capital of this aristocratic republic had attained the last limits of a luxurious and voluptuous civilization. Wives no longer became mothers unless by accident, they no longer desired the inconvenience of maternity, and reigned in all the splendor of their unblemished beauty. Life had been, if not dried up at its source, at least rendered irremediably unfruitful. No young women remained; the soil, too, was sterilized, and the generation saw the end approaching. In this dilemma, an aerial flotilla was constructed and all the strong men started on a voyage of investigation of the whole equatorial zone, to see whether any isolated human groups still existed. The entire earth had almost disappeared beneath snow and ice, and already half the members of the expedition had died of hunger and cold, when the survivors discovered a human settlement on the banks of an unfrozen river. They were received as saviors by men who believed themselves the only survivors of terrestrial humanity, looking on with despair at the last days of the world. The river, on whose banks they were camped, was the once famous Amazon. The last woman of the community was already dead, the wine and the grain were extinct, and the men subsisted solely on fish. On hearing this, the guests were in despair; their country was still wealthy, science rendered them independent of soil and natural temperature, and the leader of the party exclaimed: "We came in search of female associates, and had we found but one single wife, all the riches of our land would have been hers." Some time before these events happened in Africa and America, the island of Ceylon, now attached to Asia, was the last refuge of the human in Asia, and there, in this former earthly paradise, not far from the equator, at the foot of Adam's Peak, dwelt twelve women, sole heiresses of the last unextinguished families. The male sex had completely disappeared. The youngest of the females, little Eva, was three years old. The decline of natural forces had brought about a decline of human forces, and with it the decline of inventions and usages which had formerly seemed so indispensable. Crossing the Pacific Ocean, our adventurers observed that Ceylon was freer from ice than other regions, and on approaching it, they saw to their joy a group of five women in mourning, the then last survivors of the race in Asia. They alighted, told the object of their explorations, and had no difficulty in convincing the fair Asiatics. Their despair disappeared like a mist; and a few hours after the arrival of the aeronauts the five nuns had become the most elegant of women. But Ceylon was more desolate than Suntown; provisions were scarce, and the whole party, taking the women with them, returned to their African home. Arrived there, they found that the friends and relatives they had left behind were all dead or dying from an epidemic; the cold, too, was increasing; and, although they kept up fires and shut off all communication with the outer air, death was busy among them until, at the end of a few weeks, all had passed away save only the youngest woman, Eva, her lover Omegar, who saw without delusion the inevitable fate which awaited them, well knowing that no other spring would ever bloom on earth. However, the sky cleared, and the young couple, taking all the provisions available, rose in their aerial boat to judge of the last invasions of the snow, and saw that the whole city was buried. They then started for the Nile Valley, and on reaching it saw with delight that the Great Pyramid was still standing, the last evidence on earth of the work of man's hands. There they found shelter among the ruins, and, folded in each other's arms, took their last look at earth; and, murmuring eternal love to each other, they sunk into the sleep of death. And the snow continued to fall, as a fine powder, on the surface of the earth. And the earth continued to revolve on its axis, and to float through the immensity of space. And the sun continued to shine, but with a redish and barren light, and stars continued to scintillate in the immensity of the heavens. And the infinite universe continued to exist, with its billions of suns, and its billions of living or extinct planets. And in all the worlds peopled with the joys of life love continued to bloom beneath the smiling glance of the Eternal.

PRE-HISTORIC LONDON. — Three Chaldean monuments of antiquarian value were recently discovered under the foundation of an old London house. The site was formerly occupied by the dwelling of a Dutch merchant who traded in Persian ports. At the time of the great fire the stones probably fell through the ruins by their weight, and escaped notice when the house was rebuilt. They belong to the pre-Semitic age, and the characters upon them are of the most archaic form.

NATURAL COKE.—A remarkable discovery has recently been made near Ooalaska, Alaska,—coal transformed into coke solely by the forces of nature. The locality has been taken up by the steamship company. So positively assured is the company of the extent of the deposit that it has undertaken to supply the local demand, in addition to furnishing during future seasons fuel not only for its own steamers but also for those of the government service.

BOTTLE STATISTICS.—It is computed, in recently made statistics, that the glass bottle production of the world amounts to a daily output of a little over eleven million bottles. Of these, Germany, Belgium, and Austria-Hungary make more than three-fourths, England and Sweden coming next, while the production of France and the United States combined is said to be quite inconsiderable in comparison.

NEGRO PHYSICIANS.—The fifteenth anniversary of the Meharry Medical Department of Central Tennessee College was held February 19th. The Nashville *Journal of Medicine and Surgery* says that more than one-half of the educated colored physicians of the Southern States are graduates from Meharry College. With scarcely an exception, they have been cordially received by the white physicians, who have consulted with them in dangerous cases, and assisted in difficult surgical operations.

SHELLING PEAS.—An Albany firm has gotten out a patent on a device for shelling peas. The novelty about this machine is that the peas are cut down like wheat or barley, and the vine and pea are all fed into the machine, which separates the green pea from the vine and pod perfectly fine and clean. The machines are large, being sixteen feet long, eleven high and six wide. The company do not sell these machines but let them out on a royalty, and they are in great demand in all places where canned goods are put up as they make a very great saving in the harvesting of peas.

RAZOR FREAKS.—The finest grades of razors are so delicate that even the famous Damascus sword blades cannot equal them in texture. It is not generally known that the grain of a Swedish razor is so sensitive that its general direction is changed after a short service. When you buy a fine razor the grain runs from the upper end of the outer point in a diagonal direction toward the handle. Constant strapping will twist the steel until the grain appears to be straight up and down. Subsequent use will drag the grain outward from the edge, so that after steady use for several months the fibre of the steel occupies a position exactly the reverse of that which it did on the day of purchase. The process also affects the temper of the blade, and when the grain sets from the lower outer point toward the back, you have a razor which cannot be kept in condition, even by the most conscientious barber. But here's another curious freak that will take place in the same tool: Leave the razor alone for a month, or two, and when you take it up you will find that the grain has assumed its first position. The operation can be repeated until the steel is worn through to the back.—*Manufacturers' Gazette.*

CARING FOR THE COMPLEXION.

SOME PRACTICAL SUGGESTIONS ON AN IMPORTANT THEME.

A writer, evidently of the fair sex, and therefore best qualified to discuss the subject, expresses herself on the subject of preserving the complexion, in the *Soap and Perfumery Journal* of this city, as follows: "There has never been a great beauty who had not a fine, smooth skin. It may not have been rosy or fair, it may have been that most exquisite of tints, a clear olive. But it was at least free from spots and imperfections and sufficiently fine to show the veins under it. She may not tell it, but every woman whose skin keeps good takes care of it. A perfect complexion is like a fine bit of china; it needs continual consideration, and though it is not kept under glass it must be treated all the more carefully because of that fact. The spring and the early summer months are essentially the time to get one's complexion in good order, the danger of catching cold from various simple medicines not beingso great as during the cooler days. There is nothing so good for the skin as what the English people call "brimstone and treacle," but which Americanized becomes "sulphur and molasses." Five cents' worth of sulphur, with enough molasses mixed with it to make it of the consistency of custard, is the prescription; take a teaspoonful every morning three days in the week and then stop three. It is just possible that for a while you may be spotted like the leopard," but these spots will soon disappear and your skin will be as white, smooth and delicate looking as that of a new-born baby. Dr. Erastus Wilson, the great authority on the care of the skin, evidently believed in the advantages to be derived in the liberal use of lemons. As a beverage, and also, diluted with rain-water, as a cooling wash for the face, he places them before everything else; therefore, if used with liberal discretion, lemons may be cited as a valuable medicine, and aid to the woman who wishes to make her complexion clearer. A wash for the face, recommended alike for freckles and tan, is composed of two parts of lemon juice of Jamaica rum. This should be dabbled on the face with a piece of soft linen, and may be so applied several times during the day and just before retiring at night. If the skin evinces a tendency to look dull a tonic should be applied, and a little gin in the water used for bathing the face is about the best that can be procured; it reanimates the skin, and in addition is very cleansing. A box of powdered borax should be kept on the washstand, and will be found of great service. If the water is hard it will soften it, and if the soap does not readily lather, a little borax will hasten the operation. The writer of this has frequently found, when it was necessary for her to keep awake, and she felt as if her skin was drawing together in her effort to keep her eyes open, that a little alcohol put on with a small sponge and left to dry gave new life to the face and made it possible for the eyes to stay wide open. Where there is an inclination to spots on the lips a wash of tepid milk and water applied many times during the day is efficacious. It should be dabbled on with the bit of linen which every wise woman keeps for such purposes. "Dabbling," by the way, is exactly what the word expresses, and is the right way to apply any cosmetic, intended to be healing. The average woman treats her face as she might the kitchen floor—she rubs it with a coarse towel, she's not at all particular about the kind of water she uses, and a hard scrubbing is her idea of making it clean. Now the trouble with the average woman is that she don't know how to wash her face. She's horribly insulted when she is told this, but it is true, nevertheless. How shall she do it? She wants a big bowl full nearly to the top with water that has had the chill taken off; then plunging both hands down in this she should bathe her face again and again until the water is dripping from all parts of it; then it must be gently dried in a soft towel. Hardening the skin, a process that some of the so-called health reformers suggest, is an insult to it; it would have been made like one's finger nails if it had been intended that it should have peen treated in such a rough way. The best washrag for the face is is the union of the hands, for they form a washrag with a mind and never hurt one. If the face is dusty and soap is to be applied, then the washrag should be a flannel one. Don't be afraid to use hot water on your face. Florence Nightingale said that when it came to a question of removing dust or dirt from the face, and anybody wanted to see which was efficacious, she washed one sick soldier's face with cold water and one with hot, and the difference between the two, the color of the water after use and the result on the skin, left no doubt in the minds of the lookers-on as to the desirability of that which was warm. If you ask your physician anything about freckles he will learnedly call them lentigo. Now, freckles are not altogether the result of the sun on the skin; the skin itself is in a supersensitive condition when these spots come out, so the first thing you want to do in an effort to get rid of them is to induce your physician to give you a good tonic and to take it regularly. If the freckles do not go away of themselves, then try that simplest of remedies, lemon juice, for them. Too much food and lack of exercise make the skin "doughy looking," the eyes dull, and, as a natural result, the temper very unreliable. Avoid shocks. When you are very warm do not bathe the face in cold or even cool water; instead choose that which is tepid, and the skin will not then be rendered sensitive by the rapid change from heat to cold. Distilled water is best for the skin, and the next best is rain-water. Hard water makes it coarse, and eventually causes deep wrinkles. In the country, where hard water is often the most plentiful, she who would preserve her beauty of color and softness of the skin should be careful to use nothing but rain-water. Borax in the water makes the skin lustrous, and possesses the recommendation of ancient favor, as it was in use by the women of Egypt, who extolled its value for this purpose. Too much cannot be said in favor of the bath. It not only keeps the skin in good order, but has a delightful effect on the mind. It rests, refreshes and improves the body, and in time of worry is almost as soothing as sleep itself. It may be said that we can drown trouble in it. Certainly the bath will rid us of care for a time, and that is a great deal in a world that morbid and dyspeptic people pronounce "full of woe."

LABOR AND HUMANITY.

THE "NIGHTINGALE'S" DESCRIPTION OF A MODEL ESTABLISHMENT.

The nearest approach to the Dressmaking Association that Walter Besant, in fancy, established in Stepney Green, one of the darkest spots in the east end of London, has been realized by Messrs. Ferris Bros. in their new factory, at Newark. There are 350 employes in the factory, 330 of whom are young women. There are bath-tubs in the factory, with an abundance of hot and cold water, linen towels and toilet soap. In the girls' bath-room there are rugs under foot, the finishing is done in oak, the trimmings are nickel-plated, the sanitary arrangements are perfect, and everything is as bright and clean as it is possible to make it. Each employe is allowed thirty minutes for a bath, and if one is as fastidious as to need three-quarters of an hour, no comments are made. Every day tea, with milk and sugar, is supplied by the firm free of charge; oatmeal is furnished three days in the week at the same rate, and every other day soup is served at three cents a bowl. The entire floor is carefully cemented; it is light, warm and clean, and there are tables and benches for those who lunch in the building. An hour is allowed at noon, and while all are expected to be on hand promptly at 1 o'clock, the girls living at a distance from the factory are permitted to leave before 12 o'clock. At one end of this spacious floor there is an improvised music-room with a piano and window garden, where the girls sing, dance and sun themselves every noon. Opposite is an enclosed sanctum, divided into a reading and reception room. Bright, soft rugs are scattered about. The reading table is as well stocked with current literature as a club man's literary table. While not intended for circulation, the papers and periodicals are reserved for the exclusive use of the girls. An open fireplace is one of the attractive features of the reception-room, and there is a mantle mirror, too—that means of grace so dear to the sex. No charges are imposed upon the operators. They do not have to buy thread, pay machine rent, or replace broken needles. If an attachment is displaced it is restored by the firm, and even the girls' scissors are kept sharpened at the expense of capital. Hot and cold water, mirrors, towels and soap are amongst the conveniences. Posted over the stationary wash-basin is this request: "Please help with your forethought to keep things clean and nice."

BEEF ADVANCING.

THE CAUSE BEING THE INCREASED COST OF CATTLE ON THE RANGE.

The advance in the prices of meats has become general throughout the country—the increase being from two to five cents per pound on nearly all cuts. When, nearly two years ago, some of the best-posted writers warned the public and cautioned the stock-raisers, they were laughed to scorn and their predictions were held up to ridicule as the croakings of alarmists or the utterances of monopolistic tools. Sound reasons for the predictions were brushed aside by mere assertions, and were met by some would-be authorities with the statement that the ratio of beef cattle to population was steadily increasing, notwithstanding the heavy drafts made for export and the numerous causes cited as tending towards a decrease. The unprecedented marketing of calves and cows and the great increase in the practice of spaying heifers were pointed out as certain to produce a shortage before the lapse of three years, even if there was no increase in the exports of beef products. The increase, however, has been very great, and, combined with the causes named above, has produced the exact result predicted by the few and scouted by the many. From every quarter of the country comes reports of high prices for beef, and there appears no prospect of an early decline. The recent large purchages of range cattle by the Western packers indicate a conviction on the part of those engaged in the dressed-beef industry that there will be no decrease in the prices now prevailing, but rather that they will probably advance still further. High prices for beef will lead to the substitution of cheaper food, and mutton is likely to become, in a measure, a substitute for beef, as it has in Great Britain. Those who are always ready to lay every grievance at the door of the dressed-meat magnates of the West, are silly enough to have stated that the advance was directly chargeable to them, when the fact remains that range cattle are considerably higher in price than they were a few months ago. Some of the journals which make it a point to distort facts in order to appear to be argumentative, deliberately falsify and change reliable figures in order to support their position. Such journals, and even prominent stockmen who know better, have stated that the Western dressed-beef companies control the prices of meats throughout the country, and have brought about the present advance without any reason but to put more money in their coffers. Such statements are too ridiculous to be worthy of serious contradiction, especially in view of the facts presented above, showing the best of reasons for higher prices. From Helena, Mont., comes the report of a large sale of three and

four-year-old beef cattle at $50 per head, which is the highest price paid for beef cattle for several years past. This is one case of many which show that there has been a marked advance on the ranges, which necessitates an advance all along the line. It is very unfortunate that it is so, but all the false charges which can possibly be made will not alter the facts or reduce the prices. The advance is due to natural and legitimate causes, and will be governed by the legitimate demands of trade. When the cattle market becomes easier, the price of beef will fall.—*National Provisioner.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobsters, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

SPRING SOUP.—Wash and peel three young turnips and cut them into shreds; take four young carrots and cut them into shreds; cut off the white end of two leeks, cut them in inch pieces and then into shreds lengthwise. Put an ounce of butter in a frying-pan; when hot, add the shredded vegetables and brown them slightly; add a pint of hot water or soup stock; simmer half an hour, add a quart more of stock and two tablespoonfuls of boiled peas, or asparagus tops. Put some snippets of toast into a tureen, pour the soup on them and serve.

ITALIAN STEAK.—Take about one and a half pounds of steak from the round and fry it brown on both sides. put it in a stone baking-dish, slice two good sized onions, a bunch of parsley and a shallot and fry them in the butter left from the steak; when brown put them with the steak with a seasoning of cayenne pepper, a few cloves, one or two chopped pickles and a little salt. Over all pour two cupfuls stock, cover the dish with a tight lid and bake for an hour in the oven, then put in the dish a whole carrot and turnip that have been parboiled, set back in the oven, and when they are done cut them into dice and serve with the steak.

LOBSTER CHOPS.—Take the meat from two medium sized lobsters and chop it fine. Put into a saucepan two tablespoonfuls of butter and one of flour, let them cook for a few minutes then add a cupful of cream, and a well beaten egg, seasonings of cayenne, salt and pepper and a dash of onion juice; boil up for a minute, stirring carefully, add the lobster, take from the fire and spread the mixture out on a platter to cool; when quite cold either cut out with a knife or else form with the fingers into neat little pieces, the size of small chops, dip these in beaten egg and crumbs and fry in very hot lard, drain them, stick a claw in each and serve very hot.

CAULIFLOWER AND TOMATOES.—Take one or more small compact heads of cauliflower and boil them in salted water, when done drain thoroughly, put them in a hot dish, heads up, and pour over them a well-seasoned tomato sauce.

OATEN MEAL MUFFINS.—Make a rather stiff batter with a pint of sour milk, a teaspoonful of soda, salt, a little sugar and oat-meal flour. See that the soda is thoroughly dissolved in a little water before putting it into the milk, then beat it a few minutes, add the other ingredients, beat well and bake in a good oven in well greased pans or rings.

COCOANUT CANDY.—Slice some pieces of cocoanut very thin and line a buttered pan with them. Make a candy of four cupfuls of sugar, one of water and a teaspoonful of cream of tartar, cooked to a crisp; pour it over the cocoanut and set away to harden.

ALMOND PUFFS.—Blanch two ounces of sweet almonds and beat them fine in a mortar with orange-flower water. Beat the whites of three eggs to a stiff froth, add a little powdered sugar, then mix in the almonds and add enough sugar to make a thick paste. Pour by spoonfuls on buttered paper and bake in a cool oven.

ÆSTHETIC HYGIENE.

THE INFLUENCE OF BEAUTY AS A MEANS OF HEALTH.

Before one of the New York working girls' clubs Dr. Louise Fiske Bryson recently gave an address upon this subject, reversing in more ways than one the usual order of copybook aphorism. While acknowledging the impossibility of any protracted happiness without virtue, and the maintenance of beauty's fine edge without goodness, the doctor affirmed that systematic efforts to be beautiful will insure a fair degree of health, and that happiness is the best safeguard against vice. The difference in appearance between one woman and another, it was stated, is more than anything else an affair of style—that beauty of beauties so hard to define and so easy to recognize, which makes the girl of no-colored hair, features of indifferent turn, and lines none too perfect, infinitely more attractive than other maids of faultless curves and innumerable strong points not cemented by this magic quality. Style may be defined, for want of something better to express it, as an attractive manner of holding the body, a firm, graceful way of doing things and of moving about. It is the visible sign of inherent power and reserve force. It is the outcome of long, deep breaths and the use of many muscles. The prayer of the New York child, "Lord, make us very stylish," when viewed aright, is recognized as an aspiration based upon sound scientific principles, and worthy of universal commendation. Proper breathing is the first art to cultivate in the pursuit of beauty. The lungs have their own muscular power, and this should be exercised. The chest must be enlarged by full, deep breathing, and not by muscular action from without. Inflate the lungs upward and outward, as if the inflation were about to lift the body off the ground. Hold the shoulders on a line with the hips, and stand so that the lips, chin, chest and toes come upon one line, the feet being turned out at an angle of sixty degrees. It is wrong to make the bony structure do most of the work in keeping the body upright. The muscles should hold it in position. In walking, keep face and chest well over the advanced foot, and cultivate a free, firm, easy gait, without hard or jarring movements. It is impossible to stand or breathe aright if the feet are pinched. When correct posture and breathing are interfered with, the circulation is impeded, and deleterious substances in the blood tend to make the complexion bad. This is one of the many evils of tight shoes. To be well shod has a marked influence on style. The feet symbolize the body in their way as much as the hands. A clever shoemaker says that in a well-fitting shoe the human foot feels like a duck's foot in the mud. It is held firmly in place, but nowhere compressed. Nothing can exceed the vulgarity and hygienic wickedness of a shoe that is manifestly too tight. For misery-producing power, hygienically as well as spiritually speaking, perhaps, tight boots are without a rival. Next to the search for style pure and simple as a means of health, the care of the complexion and the cultivation of the right kind of expression are of great importance. The first is largely a matter of bathing and the general hygiene of the skin, while the second—a good expression—is best secured by the constant preference of higher thoughts over lower ones. This is the essence of intellectual living, and is fortunately within reach of us all. Beauty that is lasting, and really worth while, is more or less dependent upon a good circulation: while a good circulation is made possible by correct pose, proper breathing, and the judicious care of the skin, something else is also necessary to insure the normal quality and activity of the blood—and this something consists in a combination of sunshine and exercise in the open air. Town dwellers have too little of these blessings, partly from circumstances and partly from lack of wit. Exercise is the most important natural tonic of the body; without it there can be no large, compact, muscular frame It is as essential to physical development as air is to life, and an imperative necessity in the maintenance of beauty. To keep the complexion and spirits good, to preserve grace, strength, and ability of motion, there is no gymnasium so valuable as the daily round of housework, no exercises more beneficent in their results than sweeping, dusting, making beds, washing dishes, and the polishing of brass and silver. One year of such muscular effort within doors, together with regular exercise in the open air, will do more for a woman's complexion than all the lotions and pomades that ever were invented. Perhaps the reason why housework does so much more for women than games is the fact that exercise which is immediately productive cheers the spirit; it gives women the courage to go on with living, and makes things seem really worth while. In a general way the great secrets of beauty, and therefore of health, may be summed up as follows: Moderation in eating and drinking; short hours of labor and study; regularity in exercise, relaxation, and rest; cleanliness; equanimity of temper, and equality of temperature. To be as good looking as possible, and to be physically well, one must in general be happy; and to be happy, it is necessary to carry out ideas of personal taste and preference, as many of them as can be put in definite form without infringing upon the rights of others. Happiness has a distinct æsthetic and hygienic value. In itself it will secure perfect poise and respiration. To be happy is a duty just as style is a duty, and both are, in great measure, an affair of intellect and management. The old order put the cart before the horse; it said, "Be virtuous and you will be happy," a rule with many exceptions. But the old order changeth, and the modern gospel postulates happiness and material prosperity as the basis of morality. Other times, other manners. The ardent pursuit of good looks sums up the best there is in hygiene, and becomes a legitimate and praiseworthy means of health. The world has yet room for two or three truths, of which not the least is the fact that the definite desire for personal beauty—which was in the beginning, is now, and ever shall be—constitutes in itself a perfectly proper and meritorious inspiration to effort, especially in a country where the shades of Puritanism linger as a sad inheritance, and where disinterred Buddhism claims too often the frail neurasthenic for its own.—*Medical Record.*

CANCER CURE.—It is stated that a Vienna doctor has declared that cancer can be arrested, if not cured, by an injection of the dye methyl-violet.

STEAMER FUEL.—Three hundred to four hundred tons of coal per day is the amount used in some of the large passenger steamers on the Atlantic. This is about one ton per mile run.

INCREDIBLE.—It will be news to many to learn that when asafœtida is distilled *in vacuo*, one of the products is of exceedingly pleasant odor. So at least a German chemist announces.

AMERICAN ATHLETICS.

INJURIOUS CONSEQUENCES OF OVER-EXERCISE.

It is time to call a halt in the worship of athletics. We do nothing by halves in this country, and when the fashion is set and once becomes popular the actors follow it to the extremest limit. Our forefathers found sufficient exercise in their daily calling, and did not need the dumb bells, the cross bars, the trapeze, and all the wonders of the furnished gymnasium to give to their blood a healthy circulation. The farmer who held the plough, plied the hoe, swung the scythe, or handled the axe, did fully as much for his muscular development as nature in her most exacting moods could be supposed to require. The mechanic who used the saw, the plane, the adze, or the hammer, found his hands grow hard and his muscles tense without any playful attempt to accelerate the process by swinging from a rope or climbing a scaffold. The blacksmith at his forge, and the mason and bricklayer in their vocation, if they took on no superfluous flesh, found no reason to complain of lax or shrunken sinews. It is true that the shoemaker on his low bench and the tailor who bent over his work did not have the same variety of exercise in their respective callings, but out of the shop there was abundant opportunity to display the needed energy. The garden and the woodpile, the one or the other, were always waiting with the spade, the hoe or the axe, and when these failed through the passing season or inopportune weather, there was never wanting other service sufficient to quicken the stagnant blood, and take the kinks out of the unstrained cords. We are not decrying exercise, nor condemning physical training, we are only following the history of the present craze back to its origin. When the young man left his farm and gave the shop a wide berth for the more attractive clerkship, he still lacked none of the opportunities for useful bodily exertion. He made the fires, he swept the store or the warehouse, he shoveled the snow from the sidewalk, he helped to unload and to pile the goods, he carried bundles, and found enough to do to make the bed at night a welcome resort for a weary frame. As customs gradually changed, there was a large class of young men who had too little physical exertion, and really needed some form of exercise to give sturdiness to the body and to strengthen its otherwise inert muscles. Then came the gymnasium, with its adjuncts in the billiard-room and the nine-pin alley, and later the bath and the luxuries belonging thereto. It is just here that the mischief began. Exercise, to give a healthy flow to the blood, and to bring into action all the muscles of the body, is undoubtedly necessary to soundness of health; but over-training, for the sake of acquiring the agility or dexterity of the athlete employed in the circus, is dangerous always, and any performances of this character, when undertaken without the constant supervision of an experienced and conservative teacher, are certain to produce some permanent injury. It is a serious question whether the gymnasiums in this country, taken together, have not done quite as much harm as good. It is certain that greater caution and moderation in their use must be taught and enforced if they are to be the unmixed blessings their advocates represent them. Intelligent physicians have found the physical effects of these severe strains of the muscular system too injurious to pass unnoticed, and their voice of warning has come none too soon, for we know of many who will never recover from excessive indulgence in what they considered a harmless recreation. The athletics that have been brought more prominently before the community in the public games that have been thereby encouraged, are still more disastrous. Rowing in moderation, as a personal exercise, expands the chest, develops the muscles of the arms and legs, and tends to give sturdiness to the whole frame. If the practice stopped just there, there is nothing to be said against it; but when a college student joins a club, and enters into a course of training for a race, in the hope of becoming the champion of his class, or of winning in some annual contest with a similar club belonging to a rival institution, he is certain to injure himself, both in the early practice and the competing effort. We are not criticising his consequent neglect of his studies, and the substitution of physical prowess for intellectual culture, but we do insist that not one in a hundred can go through all that is required to prepare for a rowing match, and to take a final part in it, without some permanent injury to the organism of his body. The foot-ball games are still more to be deplored. The ordinary practice of foot-ball is of doubtful utility, but where it is resorted to as mere play, without any of the excitements of a serious contest, it may be indulged in occasionally without serious injury; but the collegiate contests are absolutely brutal, and ought to be suppressed. If the competition was confined to kicking the ball, the bruised ankles and battered shins, from which some never recover, would be bad enough, to say nothing of the over-strained muscles; but kicking the ball is not the means adopted to win the game; it is a fierce struggle, in which all the powers of the body are used in wrestling, pushing, lifting, wrenching, and contesting inch by inch the loss of ground on either side. Every opportunity of disabling the antagonist, except by the use of the fist in a downright blow, is permitted, or at any rate is practiced; and a crowd of fighters at a wake, where whiskey has been too plenty, or a contest between two Irish counties on the last day of an old-fashioned country fair, never presented a sorrier set of victims than come limping home with battered visages from these annual games. The base-ball practice is a little less hazardous, but this in a great measure has lost its amateur character, and has now degenerated into a money-making business for stock actors and their supporters. Our whole system of athletics in this country needs a careful pruning and revision.—*Journal of Commerce.*

ENERGY.

THE RELATIONSHIP OF FORCE AND MATTER.

Before the Thomson Scientific Club, at Lynn, Mass., Professor Thomson recently delivered a very interesting address on "Energy." Formerly, he said, matter was considered as the thing that existed, and force the something that acted upon it. Energy is a term used to express something which we do not always understand. It exists everywhere so far as we know. Matter was considered indestructible. If we admit that energy can act on energy, we have no need of the old matter and force. We can see the changes in energy, though we cannot discover the thing itself. We have potential and active energy. Potential is simply stored energy, power to do work. The water in the reservoir is the same as the water a hundred feet lower, but it can do the work that the other cannot, because it has energy stored in it. When that water is running down the hill and turning the wheel, it shows its actual energy. The earth revolving is another case of stored-up energy, as is also a wheel in motion. A spring is an example of elastic energy. In a boiler we have kinetic energy transformed from the heat of the fire. These are all mechanical forms of energy. The cannon ball shot into the air shows energy of motion in its ascent. When it reaches the highest point, it has energy of position. When it strikes the ground and bounds, it shows elastic energy. Besides this there is energy of temperature, which the hot cannon ball possesses. This is called molecular energy. If we could take all the heat out of anything, it would become liquid and then frozen. This has been done even to air. There is another or electric energy, another chemical and another radiant. Every form of energy is convertible into any other, sometimes at so great waste as to be impracticable for use. In converting mechanical energy into heat it is almost perfectly efficient, but in converting heat to mechanical motion ninety per cent. is lost. The energy of heat is disorganized as contrasted with the organized, direct energy of motion. A disorganized army, each soldier going his own way, can do little. The tendency in nature is to degrade energy.

DON'T GET SICK!

Nine times out of ten sickness is unnecessary. Of course there are many ailments against which we can not make ourselves invulnerable. Injuries by accident form one large class. Diseases incident to changes in life, such as the teething of infants, the ills of motherhood and the wasting-away and other maladies of old age are a second. Then there are the epidemic and germ diseases, such as cholera, glanders, small-pox, yellow fever, typhus, anthrax, consumption, leprosy and lupus, against which science is now beginning to make rapid progress. But of the other and commoner sicknesses, such as coughs, colds, headaches, "malaria," mumps, diarrhoea, colic, indigestion, congestion of the kidneys, heartburn, eruptions, boils, ulcers, these and a thousand others are the result of ignorance, carelessness and wilful disregard of the principles of common sense as well as the teachings of physiology. With but a slight knowledge on the subject and with reasonable care, it is possible to pass through life and hardly lose an hour from the causes mentioned. It must be remembered that the blood is as it has been poetically called the life-current. It bathes every cell and molecule of the body, it renews every part, it brings the countless atoms which constitute increase in weight, and it takes away those whose loss means decline, emaciation and death. As it means life and death, so when it is in normal condition it means health, strength and happiness and when impure or charged with humors it means disease, weakness and suffering. The first great principle is to keep the blood pure. This cannot be done in a moment. It takes time to purify the blood just as it does to overload it with humors and the worn out particles of the physical system. But the process of purification involves the corresponding disappearance of the various symptoms of sickness, and the final state, when reached, of normal purity is marked by the utter vanishing of every ailment. Every one knows how the system becomes clogged with humors. Over-eating and over-drinking, dust from the air, dirt from clothing, unwholesome food, inherited taints and unsanitary surroundings are the chief causes in nearly every case. These causes are simple and easily understood. Equally simple are the remedies for undoing the harm done. Sunshine and plenty of it is a necessary medicine. Go out into the fresh air as often as possible, take long walks, keep your windows open and your rooms full of daylight. We are like flowers and fruits and can never reach a beautiful maturity without sunlight. Warm bathing is more important. Take a lukewarm bath every day, not cold because it shocks both skin and nerves. Not too hot, because it weakens the pores and glands. Do not use too much detergent. A spoonful of ammonia, a few grains of borax, sodic carbonate or potash lye thrown into the bath-tub or a fine toilet soap will accomplish all that is needful. Above all, purify the blood from within by using Ayer's Sarsaparilla. It is not a secret drug, but the finest scientific combination known to science, of Honduras Sarsaparilla, yellow dock, other powerful tonics and diuretics. Anyone can make it, but to make it at home would cost a hundred times more than you can buy it for. The ingredients named, when properly combined, stimulate and strengthen the liver, kidneys and stomach, and in this wise expel or destroy every particle of humor, debris, decay, or impurity that may be floating in the blood or deposited in the system. No matter how deep-seated or long standing any ailment, Ayer's Sarsaparilla rapidly cleanses the entire system and so does away with the disease.

BUSINESS NOTES.

IMPERIAL GRANUM.

Among the foods prepared for infants and invalids none has taken a stronger hold upon the medical profession, and those who have used it, than Imperial Granum. Its method of preparation is peculiar, and in spite of all the fine-spun theories, it has proven itself practically a good and useful preparation, easily assimilated, containing a very large amount of nutriment and not requiring either skill or time in cooking nor labor of a delicate, weak stomach in digesting. The numerous certificates from the most eminent physicians published by the proprietors, sufficiently attest the well-deserved popularity of this valuable physicians' aid.

The Armless Wonder.

He uses the harmless wonder, *Pearline*, for bathing. A teaspoonful on the sponge or wash rag is enough. You'll find the directions on every package. Try it. It's as clean and refreshing as a Turkish bath—almost nothing to pay—no danger, no more than with good soap—but there's no soap as good. It does more, it's more effective—in the bath as in everything else. And it washes everything—in hot or cold, hard or soft, salt or fresh water. It makes no difference if you use *Pearline*. In the laundry and for house cleaning *Pearline* makes a saving of dollars for every penny of its cost—every grocer sells it.

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back*. 191 JAMES PYLE, New York.

THE RETORT SCIENTIFIC.

A CORRESPONDENT EMPHATICALLY DENIES THE ALLEGED WORTH OF ALUMINIUM.

In the *Tribune* of May 6th we find what purports to be a communication from a Springfield, Mass., correspondent, signing himself "C M.," over the date of April 6, which traverses in no ambiguous phrases the generally accepted value to the arts and sciences of aluminium. He says: "It is interesting to watch certain crazes which at certain times in history have taken hold of and still affect the minds of men. Thus the tulip craze, the South Sea craze, the balloon craze in the beginning of this century and end of the last. In the present age we may notice the aluminium craze. How people will invest thousands of dollars on hearsay evidence, when they could ascertain the truth by buying 25 cents' worth of pure aluminium wire or sheet, belongs to the oddities of capital gone carzy. The yarns about aluminium are so numerous, and are repeated in so many bold and frank lies that it seems almost a vain task to try to set people right. Now, Jules Verne, the champion writer of scientific fancy, never uses aluminium much in his fiction. He knows too well that it is 'no good.' In 'De la Terre a la Lune' he uses a large aluminium bullet, not because of its strength, but because it is so light. Not long ago a card from persons interested in the making of aluminium came to me, stating that aluminium is as hard as steel. All wrong! The purer, the softer. Pure aluminium is just a trifle harder than ordinary cheap zinc or spelter, which can be soldered, threaded and drilled without difficulty, while pure aluminium cannot be soldered reliably, and for working is one of the 'nastiest' metals in existence. One great point in its favor, but only a point of skin-deep beauty, is that the aluminium rust forming in the air is white, while it is brownish red on iron, green on copper, and gray on zinc—but aluminium tarnishes readily, especially in salt air. Salt water acts upon it far more than it does upon iron, and a ship built of aluminium would be full of holes after one trip around the globe. Therefore, for ship building and all parts exposed to the water it is even intrinsically inferior to iron—therefore not worth 6 cents a pound. For roofing it is vastly inferior to galvanized iron, because it cannot be soldered, and much inferior to zinc—therefore not worth 5 cents a pound. For vessels to be used in the kitchen, it could only be employed if salt was kept away, but with salt present, it would not have the slighest advantage over ordinary tin pails—therefore would not be worth 8 cents a pound. For parts of machinery where strength is required, weight for weight, it is not as strong as iron. As such iron can be bought for 14 cents a pound, aluminium would be worth less than that; for the same strength aluminium would be four times more bulky. For spoons and knife-handles, where no particular quality except looks is called for, it might be worth as much as tin, say 22 cents a pound. The drawback in that use would be its great softness, as it soils the fingers when handled, like lead. The only use for which at present pure aluminium may take, with advantage, the place of longer-known metals, is for electric appliances and wires. For the same diameter, aluminium is twice as good a conductor as iron; its weight is almost exactly one-third, but its strength is only one-fourth, so that the wire could only be stretched three-fourths the distance over which now iron wire is stretched to keep the same relation between weight, strength and sagging. For these purposes aluminium might be worth 12 cents a pound. It could be made harder by alloying it, especially with silicon, but even the hardest aluminium, short of aluminium bronze, which is essentially 90 per cent. copper, I met with was only about the strength of brass. The alloys of aluminium have all been made and tried thousands of times, but no value has been found in them which would make the aluminium worth more than copper—say, perhaps, 18 cents a pound. The aluminium bronze keeps fairly bright, but when made in its proper proportion is extremely hard to work. In this bronze aluminium shows at its best, but does not come up to good steel in ease of handling and working. One advantage is that the bronze is elastic and springy, even when almost red-hot. It consists essentially of 90 per cent. copper and 10 per cent. aluminium. How much the metal is worth for advertising medals, for plaques and other uses of a more sensational character is, of course, impossible to estimate. Its value ranks with that of the chromo. At present, its greatest use lies in the magnetic power which it has for greenbacks, and in proving the defective experience of capitalists. While, therefore, as will be seen from the frequent examples quoted, the true value of aluminium does not lie much above that of zinc, which costs 6 cents a pound, the cheapest aluminium in the market is held at $2.25, and the manufacturers are already compelled to send around circulars, in which you may read between the lines: 'Tell us some use of aluminium.' There is not a single application, at present, in which aluminium ranks intrinsically above the value of the same weight of copper, which is 16 cents a pound. Even chemically, it has not the energy of sodium, potassium, magnesium, and in an extensive practice as a chemist I haven't had a single use for aluminium in fifteen years."

INCH OF RAIN.—An "inch of rain" means a gallon of water spread over a surface of nearly two square feet, or a fall of about 200 tons to an acre of ground.

DISEASE BEARERS.—"It is no new doctrine," says the *Lancet*, "that in the presence of infectious or contagious disease every object may become endowed with a mischievous faculty of transmission. Nothing is exempt, though some substances are naturally better fitted to act as media than others. Such substances as clothing and carpets may be placed in the first rank, and paper, especially in the book form, hardly second. The scrupulous rigor with which measures of purification are adopted in regard to all these, is proof of the wholesome suspicion with which they are commonly invested. It was not to be expected that paper money could escape the stigma, nor should it. Even solid coin has latterly been credited with the same maleficent property. It cannot be denied, indeed, that any penny or shilling may thus be made to bear a novel and mischievous increment of its own."

IMPORTANT PRECAUTION.—In some cases, it becomes impossible to locate a furnace to supply warm air to all the flues built in the house. The difficulty could be overcome if all the details of location of furnace, length, size and shape of air pipes and flues, size and position of smoke flue, position and size of cold air duct, were carefully studied, and included in plans and specifications.

THE MODEL KITCHEN.—The importance of a good kitchen can hardly be exaggerated. It is the great laboratory of the household, and it ought to be remembered that not only the comfort, but the health of the family also is greatly dependent upon the manner in which food is prepared. A kitchen should be proportioned to the size of the house, reasonably large, with good height of ceiling, well lighted, and properly ventilated.

NEGATIVE AND POSITIVE.—A novel lawsuit recently came before the court of Petersburg, Virginia. A short statement of the facts is as follows: Davis, a photographer, some time ago sold to a florist a lot of refused negatives, which he wanted to use to cover his hothouse. Foster, a rival photographer, bought some four hundred of the negatives from the florist, and from these printed photographs and exposed them as specimens in his gallery. Davis obtained an injunction to prevent Foster from so using the negatives, and the court perpetuated the injunction.

MANUFACTURE OF OLD LACE.—A technical journal, in a chapter devoted to the tricks of various trades, tells how the ordinary quality of machine-made lace can be toned up to bear a close resemblance to the genuine article, and gives the method by which hundreds of yards are treated every year. The lace is rinsed in a strong decoction of Oolong tea which has been strained and allowed to become cold. The lace should not be crushed in a wringer, but pressed with the hands until partially dry, then spread on a clean ironing board. The delicate points are then carefully separated, so that the pattern may be preserved. When dry the lace exhibits a tea tint, which lends the material a tinge of yellowish antiquity.

IRON AND STEEL.—Add carbon to pure iron and it becomes steel. Add a hydrocarbon to iron, and steel itself becomes so extensively modified that its properties are not recognizable. Thus steel may be as soft as pure iron. Add hydrogen, in varying quantity, and it has the quality of resilience, as in the watch spring, or the quality of tenacity, as in the knife or razor, or may be given nearly the hardness of a diamond, as in a file. With steel at a low temperature, from 400 to 450 deg. F., edge tools are produced, the color in the yellow shades; from 500 to 525 deg. various sorts of springs are produced, color blue; while by heating iron to whiteness and plunging it into water, which is mainly composed of hydrogen, files are produced or forms even harder.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM THE GREAT MEDICINAL FOOD

REGISTERD.

IMPERIAL GRANUM.—There is one dietetic preparation that goes on in the even tenor of its way, always a popular food with the doctor when no other one can be, or will be, retained on the stomach. It is carefully prepared, never disappointing, always a valuable aid to the busy doctor. Easily assimilated, with the greatest possible amount of nourishment, combined with the minutest amount of labor in its digestion, IMPERIAL GRANUM stands to-day, without a rival, in the room of the sick or convalescent. While good for children in all the varying periods of their existence, yet its strongest hold is in the sick room where either adult or little one needs a soothing, sustaining diet with the least amount of physical effort for its digestion.—*W. C. Wile, A.M., M.D., The New England Medical Monthly, Dec. '90.*

IMPERIAL GRANUM in my hands, seems to be all that is claimed for it, and experience has taught me to rely on its use where its special properties are indicated. In infantile diseases it has proved very efficacious, and I always direct its use when a child is being weaned.—*P. Varnum Mott, M.D., Boston, Mass.*

IMPERIAL GRANUM—"Of the preparations so varied and so highly commended by those who put them on the market, IMPERIAL GRANUM seems to hold the first place in the estimation of medical observers."—*N. Y. Medical Record, Vol. 13, No. 23.*

IMPERIAL GRANUM, the invaluable food for children and invalids, is in constant use in the hospital, and has shown its superior value many times. Thousands have been helped back to strength by the support rendered by this easily digested and palatable food.—*The Cottager, Mass. State Hospital Cottages for Children, Aug., '89.*

IMPERIAL GRANUM is a prepared food that has acquired a very high reputation for its nutritive and medicinal excellence, and we have found it adapted to very young children as well as adults—in fact, we have used it successfully with children from birth.—*The Post Graduate Journal, New York, April, '90.*

IMPERIAL GRANUM is acceptable to the palate and also to the most delicate stomach at all periods of life.—*Annual of the Universal Medical Sciences, '90.*

Many are good, but one of the best is IMPERIAL GRANUM. It has stood the test of many years, and has not been displaced by any yet introduced later; while many competing kinds of prepared foods have come and gone, and been missed by few or none. But this will have satisfactory results in nutrition far into the future, because it is based on merit and proven success in the past.

The Phaumaceutical Record, New York, March 19, '91.

IMPERIAL GRANUM is an invalid food of unrivalled purity, very palatable, and of especial value in typhoid fevers, inanition, and enteric troubles generally. Its sale is world wide.—*The Homœopathic Recorder, Philad'a, Pa., May, '90.*

Hay, choice to fancy, perpetual pressed bales	13.00 to 14.00
Hay, fair to good	12.00 to 13.00
Hay, poor to ordinary	10.00 to 12.00
Hay, Clover and Clover mixed	10.00 to 11.00
Hay, swale	8.00 to 8.50
Straw, Rye, good to prime	17.50 to 18.00
Straw, Oat	8.00 to

BOSTON, May 9, 1891.

Receipts for the week are 180 cars of Hay and 15 cars of Straw; corresponding week last year, 209 cars of Hay and 12 cars of Straw. The receipts are moderate and the stocks here are well cleaned up. The market is firmer in consequence. It is a good time to get in shipments. Rye straw is steady, with moderate receipts and moderate demand.

H. F. WILSON,

WIRE BALE TIES,

458 WEST 38th STREET, New York.

COPPER ON PORCLAIN.—Manufacturers of statuettes and other articles of porcelain have been experimenting for a long time in the direction of a process to cover porcelain articles with a deposit of copper. No successful industrial process has been discovered until recently, a Vienna chemist solved the vexed problem. The process is as yet a secret, but it is stated that one of the coating products is first used to fill the pores of the porcelain biscuit, thus preventing the crystallization which has heretofore characterized other processes. This treatment is followed by the processes of electric deposition now in vogue. The results are said to be very remarkable, the articles being difficult to distinguish from bronzes.

FIGURE THIS OUT.—Charles Jahnke was married at Memphis lately for the fifth time, and his bride is Mrs. Lizzie Perche, being her third time. The groom is 55 and the bride 30 years old, and both are well-to-do. Three of Mr. Jahnke's five spouses were widow's when he captured them, and all three of his bride's husbands were widowers. Jahnke has two children by different wives and one stepson contributed by one of the widows he married. His new wife brings him two more stepchildren by different husbands. The happy couple are somewhat bothered to know what relationship all these children will bear to one another and what would be the result to their children in case they should intermarry hereafter.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

THE GREAT AMERICAN TEA COMPANY

LADIES

GET UP ORDERS.
Entire New Departure.
A HANDSOME PRESENT TO EVERY SUBSCRIBER.
THE GREATEST INDUCEMENTS EVER KNOWN TO INTRODUCE OUR NEW GOODS.

If you enjoy a cup of **Delicious Tea** send in your orders. 3½ lbs. Fine Tea by mail on receipt of $2 and this "ad". Beautiful premiums given away with $5 orders and upwards. The **most extraordinary bargains** ever offered, during the next thirty days. China Tea Sets and Lamps with $10, $15 and $20 orders to introduce our excellent **New Crop Teas.** Formosa and Amoy, Oolong, Congou, English Breakfast, Japan, Imperial, Young Hyson, Gunpowder, Sun Sun Chop and Mixed. Good mixed teas 20c. per lb. Headquarters in United States for Fine Teas. One pound of our tea will go farther than three pounds of trash. Thirty years' national reputation for selling **Pure Goods Only.**

THE GREAT AMERICAN TEA COMPANY,
P. O. BOX 289. 31 and 33 Vesey Street, New York.

We shall be glad to supply our readers with any periodical published at club rates.

Send us a postal naming periodical and we will quote you prices.

ANALYST PUBLISHING CO.,
19 Park Place, New York.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

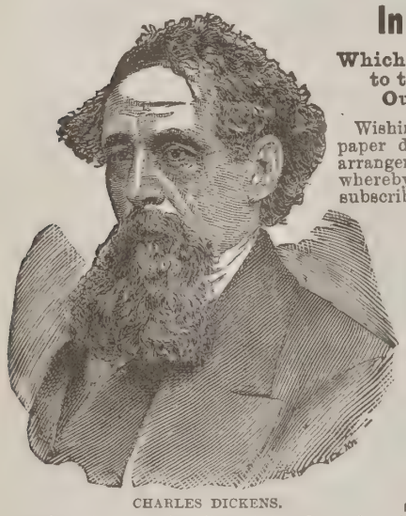
Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

THE ANALYST PUBLISHING CO.,
19 Park Place, New York.



GRAND PREMIUM OFFER!

A SET OF THE

WORKS OF CHARLES DICKENS,

In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens, in Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

GLENN'S SULPHUR SOAP.

Glenn's Sulphur Soap is the **Original** and **Best** combination of its kind, and the one now generally in use. For sale by **All Druggists.**

BEWARE OF COUNTERFEITS.

Wholesale Depot,

C. N. CRITTENTON,
115 FULTON STREET,
NEW YORK.

Be progressive and keep abreast of the times. Avoid dyspepsia by using **Lard Compound** and **Cottolene,** a substitute for lard.

The highest medical authorities pronounce them healthful; and expert cooks commend them.

Our **Clairette** brand of cotton oil soap is the purest and best laundry soap in the market; as pleasant to the hands as genuine castile.

N. K. FAIRBANK & CO.,
CHICAGO AND ST. LOUIS.

OUR GREAT OFFER

TO SUBSCRIBERS

TO THE

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

NAVIGATING THE AIR.

At the annual meeting of the National Academy of Sciences held in Washington, D. C., in April, among the interesting papers that were read, one by Professor S. P. Langley, of the Smithsonian Institution, on "Flying Machines," attracted the greatest attention. Professor Langley gave the result of a series of experiments he began about five years ago to ascertain the possibilities of aerial navigation. He said that he set up on the grounds of the Allegheny Observatory a whirling machine with a diameter of sixty feet, and driven by a steam-engine of ten or twelve horse-power. He first sought to ascertain whether or not it required more power to move laterally than to stand still in the air. For this purpose he had suspended a flat brass plate from the arm of the whirling machine by a spring. When the machine was put in motion and the plate encountered an artificial wind going forty miles an hour, the spring instead of elongating actually shortened, showing that the weight or power required to suspend the plate was less when in motion than when it was standing still. His next series of experiments, Professor Langley said, demonstrated that it took a second or two more for a brass plane to fall four feet while in motion than when it was dropped from the hand without motion, the plane when in motion laterally sinking slowly as if the air had become dense like cream. From his experiments he reached the conclusion that the amount of power required for artificial flight was perfectly attainable by steam-engines we now possess. To him the amazing thing demonstrated by the experiments was that the faster you go the less it costs in power, and that a one-horse power will transmit a much heavier weight at a rapid speed than at a slow one. In summing up Professor Langley said that he did not say that man could traverse the air, but under certain conditions and with our existing means, so far as the power is concerned, the thing was possible. The difficulties would be in getting started, in coming down to the ground again, and in guiding one's self through the air. Nature had supplied an instructive intelligence in a bird to balance and guide itself. He did not question that man would ultimately acquire it. He thought all aerial navigation would pass out of the sphere of charlatanism and into the hands of engineers in a short time, possibly months instead of years. He believed we would see something notable come from it.

OLEOMARGARINE.

We have had repeated occasion to denounce the oleomargarine law as a monstrous sample of class legislation, and we are not alone in our opposition. The operation of the law has been somewhat different from what its projectors expected, as the *Sun* shows in a recent editorial discussion of the subject. It says the oleomargarine act was passed in 1886 ostensibly for the protection of consumers of butter, in reality for the supposed benefit of the dairy interests. In signing it, under the influence of Bill Scott and the fear of the agricultural vote, Grover Cleveland committed the United States to the policy of using the power of internal taxation for the purpose of crippling or crushing one industry for the good of another. The precedent was dangerous, and sure to produce similar efforts to make the United States a factor in the rivalries of business. The Conger lard bill, which fortunately failed to pass the Fifty-first Congress, was the child of the oleomargarine law, and legislation of the same kind is sure to be proposed in future Congresses. Persons who believe that such exercise of the taxing power is legitimate, are invited to ponder the fact that in the case of the olemargarine act that exercise has not fulfilled the purpose intended. The production of oleomargarine has not decreased since the passage of the act, but has greatly increased. Here are the returns of the Internal Revenue Bureau from the sale of oleomargarine stamps since the law went into operation: 1886–7, $407,670; 1887–8, $642,710; 1888–9, $686,674; 1889–90, $624,490; 1890–91 (July 1, '90 to May 1, '91), $694,944. If the sales for May and June are up to April figures, the amount for the year will be nearly a million dollars. The attempt to suppress or repress oleomargarine has failed to repress or suppress. There is a great demand for oleomargarine, and the demand has stimulated production. The Federal tax has had no effect save to increase the cost of production. Cheap butter is the only thing that can repress oleomargarine.

POISON-PAINTED PEAS.

We are informed that the State Board of Health of Massachusetts has decided to forbid the sale of vividly colored French canned vegetables, because they have found by analysis of many samples that twenty-seven out of thirty-seven contained cupric sulphate of copper or blue vitriol, one of the worst of metallic poisons in its crude form. In order to give due warning to the dealers in fancy groceries the Board will at once send out circulars to the effect that the sale of articles of food containing salts of copper is a violation of the statutes, and warning dealers that a repetition of sales will render them liable to prosecution. The sale of food products containing copper salts is forbidden in England, Scotland, Belgium, Germany and other countries. It is a curious fact that it was also forbidden at one time in France, though the country allowed the manufacture for sale abroad. But the pressure from the manufacturers was so great that the law was repealed and the sale allowed at home. Prosecutions have been successful in England, Belgium and Scotland, probably also in other countries. There is a minor consideration which will have its weight, though the action of the Board was purely taken on the grounds of health. This is that the prohibition of French colored peas will help home industries. An article not so nutritious, possibly stale, and put up in Europe, is made to appear more attractive than the fresh American vegetable. Their bright color makes French peas displace even fresh green peas in July; for their color is the only superiority, and causes selection by the eye instead of by the palate.

THE CENTRE OF POPULATION.

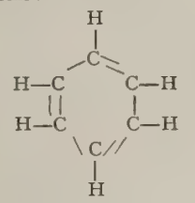
An interesting gathering, reported to have been ten thousand in number, assembled on May 10 at a point in Indiana, twenty miles east of Columbus, in Decatur County, to witness the unveiling of a monument erected to mark the centre of population in the United States. The monument is fifteen feet high, of highly polished gray limestone, and deeply cut into it is the following inscription: "Centre of the Population of the United States." This is the second time in the history of the United States that the centre of population has been ceremoniously marked with a monument. The first

time was in 1810, and the place was several miles northwest of Washington, D. C., where yet remains a small stone on which is engraved "Centre of Population." The centre of the population has travelled westward each decade about forty-five miles, and has varied from a straight line west from Baltimore as the population increased in the North and South. The only time when the exact centre could not be accurately fixed was from 1860 to 1870, when a perfect census could not be taken in that part of the United States where the civil war occurred. The following is the location of these centres each decade since 1790, when it was twenty-three miles east of Baltimore: In 1800, 18 miles west of Baltimore; in 1810, 45 miles northwest by west of Washington; in 1820, 16 miles north of Woodstock, Va; in 1830, 19 miles west by southwest of Moorefield, W. Va.; in 1840, 16 miles south of Clarksburg, W. Va.; in 1850, 23 miles southeast of Petersburg, W. Va.; in 1860, 20 miles south of Chillicothe, O.; in 1870, 48 miles east by north of Cincinnati, O.; in 1880, 8 miles west by south of Cincinnati, O.; 1890, 20 miles east of Columbus, Ind.

WOMEN'S WORK.

THE MANIFOLD OCCUPATIONS OPEN TO WOMEN IN FRANCE.

There has been published in Paris recently a book of remarkable interest to women, and, in fact, to students of social science, irrespective of sex. It is entitled "The New Practical Guide for Young Women in the Choice of a Profession," and in its pages may be learned more than a hundred methods by which French women may earn an honest livelihood in the city of Paris, as well as in the provinces. These occupations are classed under these heads: 1. Liberal professions. 2. Teaching. 3. Employment in public administration. 4. Private employments. 5. Trade, strictly so-called. These are again subdivided into needlework, work connected with the household, printing work, professional trades, industrial trades and artistic trades. A few occupations, such as the cultivation of silkworms and the manufacture of steel pens, belong exclusively to the provinces. All the information given is in a clear, practical, and exhaustive form, and, after perusing the book, one cannot help feeling a thrill of admiration at the enormous amount of skilled labor it shows to exist in Paris and the industry and intelligence that it must require. So many women, too, are employed in trades wholly feminine in their nature, but which require, of course, a luxurious public for their maintenance, such as the manufacture of stuffs for furniture, as well as the *articles de fantaisie*, which need continual invention to keep up with the fashions. The liberal professions consist of artists, doctors of medicine, health officers, druggists, dentists, midwives, professional nurses, lady inspectors of charitable institutions, hospital assistants, herborists, stenographers, and inspectors of work in manufactories. For musical artists there is the conservatoire, which is the best preparatory institution of the kind that exists. The list of studies is: 1. solfeggio, oral harmony, study of the piano and that of easy dramatic rôles; 2, singing; 3, lyrical declamation; 4, piano and harp; 5, stringed instruments to be played with a bow; 6, wind instruments; 7, counterpoint, organ and composition; 8, dramatic declamation. The instruction is entirely gratuitous. For admission to the classes the candidate must be no less than 9 years old and no more than 22, and must register her name and deposit a copy of her certificate of birth and of vaccination. There is only one entrance competition each year, and the number of places in each class is limited, except in the case of choral solfeggio. The duration of study, when there has been some previous instruction, is from two to three years. A sum of 600 francs a year is offered for competition, to enable the successful scholar to continue her studies. Every pupil who misses two classes in a month is crossed out of the books; and no pupil can appear in public without permission from the director. They are further obliged to promise not to take any engagements until their course of studies is finished, and to give aid if required at any one of the assisted theatres. Ten pensions of 600 francs and twelve of 1,200 francs are given annually, as adjudged by the examining committee, to the pupils in the classes of singing and declamation. These pensions can be withdrawn by the same authorities, if for special reasons they think it desirable to do so. The candidate who gains the first prize can remain in the class for another year. For the second and third prizes silver medals are awarded. Two trials are necessary for admission to the class of declamation: 1. A scene chosen by the aspirant, and if she succeeds well in this she is allowed to pass to the second trial, and recite a scene chosen by the jury from a list prepared by the candidate. The conservatoire is open to foreigners, which, with a few exceptions, is not the case with the other trades and professions. Painting is taught in professional schools and in private studios, there being no Government institution for the teaching of painting open to women. The "Association des Femmes Peintres et Sculpteurs," founded by Mme. Berteux, offers to its members the best chance of success in that profession. Since 1868 women have been authorized to study medicine under precisely the same conditions as the men. They are also permitted to be health officers, and here, too, the conditions are the same as for the male candidates. The school of pharmacy requires for the diploma of chemists either a Bachelor's degree or a teacher's certificate. The course lasts six years, of which three are passed in practical work in pharmacy. For dentists there is a school of odontology, founded in 1884, and there, too, women are received under the same conditions as the men. Midwives must be furnished with the diploma of first or second class. At the Clinique d'Accouchement women from 18 to 40 may attend the weekly practical lectures. After ten months course of study an examination for the second class diploma is held. The pupils leaving the Maternity usually possess a first-class diploma. All licensed midwives must possess a first-class diploma. From among these are chosen the nurses who reside in the hospital. These receive in payment 800 francs the first year, 1,000 the second, and 1,200 the third year. Seventy-five wet nurses are attached to the children's department of the Clinique d'Accouchement, and there are also certified wet-nurses attached to the other hospitals. They are paid 300 francs a year. For the post of lady delegate no conditions are exacted. These ladies receive from 1,800 ($360) to 2,000 ($400) francs a year. The sick-nurses can rise to be under inspectors and even head inspectors of their wards. These sick-nurses must also be furnished with diplomas, but that given by the municipal schools is held sufficient. They receive from 230 ($46) to 500 ($100) francs a year, with lodgings, and 1,500 ($300) to 2,300 ($440) without. There is no regularly established school of nursing in France. Herborists may learn their profession in the botanical classes in the school of pharmacy. There is no Government school of stenography, and must be learned under private teachers. France is probably the only European country enlightened enough to allow the post of stenographers to the Chamber of Deputies to be open to women. For their services in the Chamber they are paid 3,500 to 6,000 francs a year. Stenographers who report lectures, congresses or conferences are paid sixty francs an hour, each hour implying eight hours of transcribing. So far the method of Provost Delaunay is the one most used. Women are also chosen in France as inspectors of work of women and children in factories. Here there is a limit of age; they must be over 30 and not more than 45. They must pass an oral and written examination in the text of the laws written upon the subject, and they must prove that they have lived at least five years in the department where they are to serve. They have 150 establishments to visit in a month, and concerning these they must report to the prefect. They are all sworn in. To these posts there are no attached, and the salary is about 1,800 francs ($360) a year. As might be anticipated, the teaching profession is much overstocked. For private teaching no diploma is required, but practically it is needed, for a teacher with a diploma is always preferred. Ladies are sometimes attached to large scholastic establishments solely for the purpose of receiving the relations of the pupils. For their services they are paid fifty francs a month and their board. Secretaries and readers are paid from 100 ($20) to 300 ($60) francs a month. Their hours are long and their duties fatiguing. Interpreters get two francs an hour. For the post of interpreter the candidate must get herself into good relations with the hotels, for it is here that their services are chiefly required. In a lower class of life respectable women can earn ten or fifteen francs a month by taking children out for a walk every day, and thus relieving hard-worked mothers and saving them the expense of a nurse. These women are not, properly speaking, teachers, but they often talk some foreign language, and are often required to do so, in order that their little charges may gain practice. The public schools are divided into primary, secondary and superior. In the primary the best posts to be obtained are those of inspectors. There are five inspectors of boarding schools and five of infant schools. The salary is a minimum of 4,000 francs ($800) a year and a maximum of 5,500 francs ($1,100), with a bi-annual rise of 500 francs ($100). The inspectors also receive 500 francs ($100) a year for extra expenses. In Paris itself there are six inspectors of girls' primary schools and three of infant schools. The salary it 6,000 francs ($1,200) a year including expenses. There is also an inspector of the class for book-keeping and modern languages, in which the salary, together with the expenses, amounts to 7,200 francs ($1,440), and one post of inspector of schools for dress-making and cutting out. These schools are in the suburbs of Paris and the salary is 3,000 ($600) a year. The applicants must be 30 years of age at least and 35 at most, and must hold the highest diploma. They can all receive pensions, calculated after the rules applied to the employés of the Prefecture of the Seine, that is, after thirty years' service they have a right to a pension equal to half their salary. This sum is deducted from their salaries at the rate of 20 per cent. The teachers in primary schools must also hold the highest diplomas, except in the infant schools, which require a simple diploma and certificate of aptitude. Here the salaries of the teachers are from 1,5000 ($300) to 2,500 francs ($500), for the directresses from 2,750 ($550) to 3,800 francs ($760). Promotion can only be obtained after three years of service, and becomes a right after five. Good posts are those of adult school teachers, there being seventeen schools for adult women in Paris. There are sixty drawing schools throughout Paris and the provinces, but the salary of the teachers here is not fixed by the Government. These schools are excellent, and very good places in which to begin the study of art.



(*To be continued.*)

UTILIZING WASTE.

THE OBLIGATIONS OF SCIENCE TO ILLUMINATING GAS.

The first instance of practical gas-lighting on record occurred in the year 1792, when one William Murdock lighted his workshops at Redruth, in England, with gas obtained from coal, but it was not till twenty years later that the streets of London were lighted by gas, and it is only within the last half century that this cheap and convenient means of lighting streets and buildings has come into general use. The most important product of the destructive distillation of coal is, of course, the illuminating gas, the manufacture of which has already been described in these columns (July, 1888); but there are many by-products which are almost equally valuable. The residuum left in the retorts, known as coke, is a most excellent fuel, and in regions where soft coal is abundant it is a regular article of manufacture, part of the resulting gas being used to heat the retorts,

while the remainder is burnt or allowed to escape into the air. The ammoniacal liquor condensed from the hot gases as they come from the retorts contains no less than five different salts of ammonia, and is the chief source of supply of this invaluable alkali. In all, there are at least seventy different chemical compounds produced from the coal in the process of distillation, of which perhaps ten are useful as illuminating substances, while the remainder are either thrown away as impurities or saved for use in other ways. The most important of all the by-projects is the coal tar, which was formerly thrown away, but is now almost entirely utilized. This coal tar is a black viscous fluid, composed of about forty different hydrocarbon compounds. The discovery in 1850 of the aniline colors first called attention to its value, and since then an immense number of chemical and medicinal substances, artificial flavors and perfumes, insectides, disinfectants, explosives, photographic developers, as well as four hundred or more different colors, have been obtained from an ill-smelling repulsive liquid, which at first sight would appear to be the most useless thing on earth. Prominent among the substances contained in coal tar is a liquid known as *benzol*, sometimes less properly written benzene, as it is entirely different from the familiar cleaning agent known by that name. Benzol has the chemical formula, C_6H_6, and is important as being the starting-point or foundation-stone, as it were, for a long list of compounds known as the aromatic series of hydrocarbons. To account for the chemical phenomena presented by the substance, it is supposed that the atoms forming the molecule of benzol are arranged in the form of a hexagonal ring, as roughly represented in the following diagram. The lines connecting the letters represent the quantivalence or chemical affinities of the carbon and hydrogen atoms:

To thoroughly explain the theory of the benzol ring, as it is called, would lead us too far into the mysterious realm of organic chemistry, and the above diagram is only given to roughly indicate the supposed structure of a single molecule of benzol. In all the innumerable derivatives from this substance the inner ring of carbon atoms remains intact, but, by replacing the hydrogen atoms by other elements or radicals, both simple and compound, or by adding to the number of elements or radicals held to the ring by the carbon affinities an immense number of substances may be obtained, some of which may be directly obtained from the tar, while others are produced in the laboratory from the benzol itself—and as the only important source of benzol is from this by-product of the gas-works, a perusal of the list given below will show how much we owe to this industry aside from the illuminating product for which it was first undertaken. In addition to the four hundred or more brilliant aniline, alizarine, and naphthaline colors, we also derive from benzol carbolic, benzoic and salicylic acids, antifebrin, antipyrin, saccharin and thymol, all important medicinal agents; artificial oil of almonds and oil of wintergreen, the powerfully explosive picrates, the invaluable photographic developers, hydrochinone and eikonogen, besides a host of other substances interesting to the chemist only from a theoretical point of view. Quinine and morphine also belong to this series, but have not yet been artificially produced, while indigo, also a derivative of benzol, has already been prepared in the laboratory, although at a cost far exceeding that of the natural product. Finally, the pasty mass left after the distillation of the coal tar, and known as asphalt, forms a most excellent material for pavements and sidewalks. Curiously enough, the petroleum oils of America do not contain any of the aromatic series of hydrocarbons; their constituents belong to another series known as the paraffines, which do not contain the benzol ring. It is said that the East India petroleums do contain the aromatic hydrocarbons, but the supply is very small and uncertain, and until some chemist succeeds in artificially chaining the atoms of carbon together into the wonderful benzol ring, we must depend upon the by-product of the gas-works for many of our most important and valuable medicines and chemicals.

GRAPE JUICE.

THE DECEPTIVE USE OF THE PHRASE EXPOSED.

The name grape juice, like charity, covers a multitude of sins. More trash than anything else is sold under this taking title. Common sense will show at once that grape juice cannot be made to keep without adding a preservative such as alcohol, or an antiseptic like salicylic acid. Any liquid containing sugar will ferment and go through the various transformations of sugar, alcohol, vinegar, etc., and if artificially prevented, ceases to be grape juice. Lately a great deal of so-called natural grape juice has been advertised, and as it is supposed to be a healthful drink especially adapted for invalids, we have applied to an experienced wine maker from whom we obtain the information which follows, which tallies exactly with what we knew about the subject theoretically:

1. If great intelligent care be taken, grape juice can be sterilized by heating in bottle, sealing hermetically, and keeping in a temperature below 50 deg. Fahr. constantly. If moved to a higher temperature, I am afraid there would begin what is termed "insensible fermentation."

2. Alcohol will keep grape juice from fermenting, spoiling or changing, if added to the amount of 20 to 24 per cent. absolute. Sometimes 18 per cent. is sufficient, but less than 20 per cent. is risky.

3. Grape juice can be fermented to a point where sufficient alcohol is obtained to preserve the resulting liquid (wine); but it is then no longer grape juice, in the general acceptance of the term. If fermented to a certain degree, still leaving some natural sugar of the original juice, the resulting liquid will surely spoil unless alcohol enough be added to raise its alcoholic strength to at least 18 per cent. absolute. In lieu of alcohol, antiseptics, which are always dangerous to health and objectionable, may be added to secure the same result.

4. Port, sherry, angelica, sweet muscat, etc., in California, are made with the addition of more or less grape spirit, entirely without use of antiseptics, such as salicylic acid, naphthol, benzol, or other similar preparations. With port wine the grapes, according to locality where grown, are allowed to get the highest attainable sweetness, from 28 deg. Balling's scale up to 37 or more. The juice is then fermented to reach the highest possible alcoholic strength, which is seldom under 15 per cent. absolute, and in some localities reaches 17 per cent. absolute, without any additions whatever. This fermentation materially reduces the saccharine matter left undecomposed. If there is not from 4 to 6 per cent. saccharine left, that amount is added in the shape of concentrated grape juice. This concentrated grape juice is obtained by boiling down a given quantity of the juice pressed fresh from the grapes, so as to show from 70 to 75 deg. Balling's scale or saccharometer. After addition of this concentrated must or grape juice, the port is fortified to the difference between its actual alcoholic strength and at least 18 per cent. If the port showed 16 per cent., then 2 per cent. grape spirit would be added to make 18 per cent., or 4 per cent. to make 20, etc. The sherry is made very much in the same manner as the port, only differing in after-treatment. The sweet muscat and angelica are not fermented to so great a length as the port, so as to retain more saccharine and less alcohol. This necessitates also a larger after addition of grape spirit to have it attain the necessary minimum strength, viz., 18 per cent. By feeding a certain kind of grape juice with cane sugar, and treating with fresh grape yeast, two years ago, I made one thousand gallons of wine, the alcoholic strength of which reached a fraction over 19 per cent. absolute by fermentation alone. Experiments made by chemists for the British Government in Australia are claimed to have obtained a fraction over 21 per cent. through fermentation.

AIR AND FIRE.—A certain amount of air admitted to the furnace above the live coal is advantageous rather than otherwise if the supply be regulated. The oxygen of the air thus introduced assists in the more effective combustion of the gases.

LIGHTNING.—It has been calculated that the electromotive force of a bolt of lightning is about 3,500,000 volts, the current about 14,000,000 amperes, and the time to be about 1-20,000 part of a second. In such a bolt there is an energy of 2,450,000,000 watts or 3,284,182 horse power.

A JAW-BREAKER.—The champion word thus far coined, looking at it longitudinally or horizontally, is doubtless quinolineparamethenylbenzenylazoximeparacarboxylic acid. Most lexicographers will be afraid to tackle it in its entirety. Nicknames should be allowable in chemical and pharmaceutical nomenclature for such mastodonic monstrosities.

ABRASION OF GOLD COIN.—By careful experiments made at the United States Mint, says *The Iron Industry Gazette*, it has been shown that $5 are lost by abrasion every time $1,000,000 in gold coin are handled. The experiments were conducted with bags containing $5,000 each, and it was shown that the mere lifting of the 200 bags making up $1,000,000 to a truck to be removed to another vault, resulted in the loss stated, and that their transfer from the truck again made a second similar loss.

JUPITER'S DOUBLE.—It is reported that the observers at Mount Hamilton have lately kept a sharp eye turned upon the shadow of one of the moons of the planet Jupiter. This shadow seemed double, indicating that the tiny moon which cast it is also double. Since the first hint of the discovery many observations have been made through the Lick glass, all tending to confirm the original impression, to wit: That this particular satellite of the greatest of the planets is double—a dot of a moon revolving around the main moon.

HIGHEST INHABITED PLACES.—The highest place in the world regularly inhabited is stated to be the Buddhist monastery, Halne, in Thibet, which is about 16,000 feet above sea level. The next highest is Galera, a railway station in Peru, which is located at a height of 15,635 feet. Near it, at the same level, a railway tunnel 3,847 feet in length is being driven in through the mountains. The elevation of the city of Potosi, in Bolivia, is 13,330 feet; Cuzco, Peru, 11,380 feet; La Paz, Bolivia, 10,883 feet, and Leadville, Colorado, 10,200 feet.

HANDY LIGHT.—A recent novelty in electrical appliances is a handy incandescent drop light, in which the current is switched off or on by pulling the flexible cord that supports the lamp, instead of turning a key in the lamp socket. The switch is at the ceiling and the flexible conductor is fastened to the handle of the switch, which moves on the slightest pressure. A single pull lights the lamp, and a second pull extinguishes it. It is not altogether desirable that the slender conductor should always be charged, and this device very simply obviates this objection.

WORLD'S POPULATION.—In the proceedings of the Royal Geographical Society for January, 1891, it is estimated that the population of the world in 1890 was 1,487,600,000, representing an average of 31 to the square mile, and an increase of 8 per cent. during the decade. Of the continents Asia has the largest population, 850,000,000, and the lowest percentage of increase, 6 per cent. Australasia has the smallest population, 4,730,000, and the smallest average per square mile, 1.4, but the highest rate of increase during the decade, 30 per cent. Europe is the most thickly settled continent, with a population of 380,200,000, which is 101 to the square mile. The population of North America is estimated at 89,250,000, which is an average of 14 to the square mile, and represents an increase of 20 per cent. during the past decade.

ANCIENT FAITH CURE.

EVIDENCES OF FAITH CURE IN ANCIENT GREECE.

[*Prof. J. C. Rolfe, in Popular Science News.*]

Epidarus in Argolis was celebrated in antiquity as the principal seat of the worship of Asklepios (or Æsculapius, as he is more commonly called), the god of healing and son of Apollo. There were many other famous shrines of Æsculapius in the Greek world, of which those at Athens, Pergamum, and Smyrna were the most prominent; but all traced their origin directly or indirectly to Epidaurus. Its fame even crossed the seas, for as early as 293 B. C.—at the time of a destructive pestilence—the Sibylline books ordered that the worship of Æsculapius should be introduced into Rome. Accordingly, one of the sacred serpents of the god, which always accompanied the colonies from Epidaurus, was transported to Rome and established in a temple of Æsculapius, built for the purpose on the island in the Tiber. Ovid (*Met.* xv.; 420 fol.) tells us that it was Æsculapius himself, who, in the form of a serpent, migrated from Epidaurus to Rome. Serpents were always connected with his worship, and a peculiar kind of tame serpent, in which Epidaurus abounded, was kept in his temple. The Hieron of Epidaurus, as it was called in ancient times, and as it is still called to-day, was five miles distant from the town, picturesquely surrounded by hills, on one of which the god is said to have been born. The Greek traveller Pausanias has left us a description of the place as it was in the second century of our era, and the site has recently been excavated by the Greek Archæological Society. The Hieron comprised a temple of Æsculapius, surrounded by a sacred grove, and containing a statue of the god in gold and ivory; a round building, or *tholos*, like the round temples found in various parts of Italy, which was the work of the younger Polykleitos, and contained beautiful paintings by Pausias; buildings for the priests, who were also the physicians; halls for gymnastic and and musical exercises; and a sacred portico, in which the patients assembled to await the visits of the god. Just outside the sacred precinct was a magnificent theatre, also the work of Polykleitos. In Roman times extensive baths were added. To this delightful sanitarium invalids resorted from all over Greece, attracted by the fame of the marvellous cures. They spent one or more nights in the sacred portico, observing certain rules prescribed by the priests, when the god usually revealed the remedies for their diseases in a dream. Each patient, after his cure, offered a sacrifice to the god—usually a cock or a goat—and recorded on a tablet his name, the disease from which he had suffered, and the method of its cure. And we may imagine that, after the fashion of our modern quacks, the priests composed a great many testimonials themselves, to increase the fame of the sanctuary and the faith of new-comers. Among the very interesting results of the excavations at the Hieron was the discovery of two stone slabs, containing records of marvellous cures. Some specimens of these I give below. They show that while occasionally a regular course of treatment was prescribed, the majority of the cases were "faith cures." A man, having his fingers paralyzed, except one, came to the god as a suppliant, and seeing the tablets in the sacred enclosure, he did not believe in the cures, but made fun of them; and when he went to sleep he had a dream. It seemed to him that he was playing at dice beside the temple, and that just as he was about to make a throw the god appeared, caught his hand, and straightened out the fingers. And when the god was going away, he seemed to bend the hand together and to straighten out the fingers one by one; and when he had straightened them all out he asked the man whether he still disbelieved the inscriptions on the tablets in the sacred enclosure, and the man said that he did not. And, when day came, he went away cured. Unbelief is rebuked in another inscription in a way which shows that the god was not lacking in humor: Ambrosia of Athens, blind in one eye. She came as a suppliant to the god, and going around the sacred enclosure she laughed at some of the cures as incredible and impossible, that the lame and blind became whole merely by seeing a vision; and when she went to sleep she had a dream. It seemed that the god stood beside her and said that he would make her whole on condition that she would pay him by setting up in the Hieron a silver pig, as a monument of her stupidity. So saying he cut open her diseased eye and poured in a drug. And when day came she went away cured. A dumb boy came as a suppliant to the god about his voice, and when he had made the preliminary sacrifices, and gone through the usual ceremonies, the attendant of the god, looking towards the boy's father, said: "Do you agree within a year, if you obtain what you came for, to offer thank offerings?" And suddenly the boy cried out, "I do." And his father in amazement bade him speak again, and he spake again, and thereupon was cured. In the two following inscriptions the evil consequences of cheating the god out of his fee are shown: Pandarus, a Thessalian, having marks branded on his forehead. He went to sleep and had a dream. The god seemed to bind a fillet around the marks, and to order him, when he left the sacred enclosure, to take off the fillet and offer it up in the shrine. And when day came he got up, took off the fillet, and offered it up in the temple, with the marks from his forehead on it. Echedorus received the marks of Pandarus in addition to those he already had. He received money from Pandarus to offer the god at Epidaurus on his account, but did not pay the money. Now, when he went to sleep he had a dream. He thought the god came and stood beside him, and asked whether he had received any money from Pandarus as an offering to the shrine. He replied that he had received nothing of the kind, but that if the god would cure him of his marks he would dedicate a statue to him. Thereupon it appeared to him that the god bound Pandarus's fillet around his forehead, and bade him, when he went out of the sacred place, take off the fillet, wash his face in the spring, and look at his reflection in the water. And when day came he took off the fillet, on which there were no longer any marks, and saw on his forehead the marks of Pandarus, besides those which he had formerly had. The next shows the god in a kindly light: Euphanes, a boy of Epidaurus, afflicted with stone. When he went to sleep it seemed to him that the god came and asked him what he would give him if he would cure him, and he said, "Ten jackstones!" The god laughed, and said that he would help him. In the morning he went away cured. The following shows that some very desperate cases were cured: A man came to the god as a suppliant who was so blind in one eye that he had only his eyelids and nothing at all in them, but only an empty void. And some of those in the sacred place said that he was foolish to expect to see when he had absolutely no eye at all, but only the place where the eye ought to be. Now when he went to sleep a vision appeared to him. It seemed to him that the god prepared a drug, and then, separating his eyelids, poured it between them, and when morning came he went away seeing with both eyes. The success of the god was not confined to living beings: A porter was on his way to the shrine, and when he was about ten stadia away he fell. And when he got up and opened his wallet he saw that its contents were shattered. And when he saw that the cup from which his master was wont to drink was broken, he was grieved, and sat down and tried to put the pieces together. And a wayfarer seeing him said: "Why, foolish fellow, do you vainly try to put that cup together? Why, not even Æsculapius at Epidaurus could make that whole!" Now, when the boy heard this, he put the pieces in his wallet again and went to the shrine. And when he got there, he opened his wallet and took the cup out safe and sound. Then he told his master what had been said and done. And when his master heard it, he dedicated the cup to the god. Curiosity is punished: Æschines, when the suppliants had gone to sleep, climbed a tree and peered over into the sacred portico. But he fell from the tree and dashed out his eyes against some stakes. And being in a pitiful plight and blind, he prayed to the god, went to sleep, and woke up cured. Euippus carried a spear-head in the side of his face for six years, and when he had gone to sleep, the god took out the spear-head and placed it in his hand, and in the morning he went out with the spear-head in his hand. Hermodicus of Lampsacus, paralyzed. When he had gone to sleep the god cured him, and bade him go and bring into the sacred enclosure the largest stone he could find. And he went and brought the one that lies before the sacred enclosure. Even the most skeptical must have believed this, for there was the stone to prove it! Nicanor, lame. When he lay down a boy seized his staff and ran off with it. He rose and pursued him, and thereupon was cured. A man's toe was cured by a snake. This man—whose toe was afflicted with a malignant ulcer—was carried out by the attendants one day, and placed upon a seat. When sleep had come upon him, a snake coming out of the sacred enclosure cured his toe by licking it with his tongue, and then went back again. And when the man woke up he said that he had dreamed that a youth of great beauty had poured a healing drug upon his toe. Alcetas, blind. He had a dream. It seemed to him that the god came and opened his eyes with his fingers, and thereupon he saw the trees in the sacred grove, and in the morning he went away cured. I have never heard of a case in modern times of a cure of baldness by faith, but the god at Epidaurus was equal even to that. We see incidentally that baldness was rare among the Greeks: Heraieus of Mitylene. He had no hair on his head, but a great deal on his chin. And being ashamed, inasmuch as he was laughed at by the rest, he went to sleep; and the god anointed his head with a drug and made it have hair. Thyson of Hermione, he having his eyes licked by one of the dogs belonging to the sacred place, went away cured. All these inscriptions with several others are on one slab.

THE STAGE WORLD.

HOW THEATRE SCENERY IS MANUFACTURED.

Not far from the Central's tracks in Mott Haven is a big frame house. Perched on a hill, it attracts attention at once, looking gay and almost gaudy in its coat of many colors among its sober neighbors. It appears enormous compared with the country houses surrounding it, and really is a large building. A stranger might take it to be a fine country mansion; but the plain wooden fence and the untidy yard are not at all in keeping with the pretentiousness of the house, and if the stranger is at all suspicious he will think twice before settling in his mind the real purpose of the curious structure. If he were to step inside, however, all doubts would be dispelled. He would find himself at first in a pretty little office, also gay with color, and the many papers scattered about the desks in it would indicate that it was a busy place. If the stranger were to get beyond the office, he would find himself in a curious room resembling an old-fashioned garret, and filled with odd and fantastic things that might be mistaken at first for piles of rubbish, disused furniture, and old lumber. What the place actually is provided he has not satisfied his curiosity, will dawn upon him slowly as he wanders about climbing ladders and unrailed stairs, leading to different parts of the building. He will realize at last that he is among the scene painters. Formerly most of the scene painting was done in the theatres. There were some advantages attached to this method, as the scenery could be judged in the place in which it was to be used and in connection with the actors who were to appear with it. If any thing was wrong the manager could have it remedied without difficulty. But the ordinary theatre stage is not large enough and has not facilities for scene painting

such as can be obtained in structures built for the purpose, and nowadays most of the scenes are painted in buildings adapted to the work. The big building in Mott Haven has been turning out scenery by the yard every day for a long period. Adjoining the office is the shipping room, in which the scenery is boxed and prepared to be sent to the purchasers. Leading from this room is a large shop in which the stage carpenters do their work. At the time of the reporter's visit the carpenters were at work on some skeleton doors to be used by J. K. Emmet in "Fritz in Ireland." Not every carpenter is fitted for stage work, and many of the details have to be attended to by men of long experience. In making scenery the carpenter always has to bear in mind two essentials. The scenery must be very strong and at the same time very light in weight. It is all built in five-foot sections, so that it will fold up and go through an ordinary freight car door without difficulty. The corners and edges are protected by specially prepared canvas, which is glued on the wood before the nails are driven in. The carpenter must make not only smooth-working doors and windows in his scenes, but must be able to make imitation doors and windows that are not distinguishable from the genuine articles at a distance. Everywhere throughout the building the reporter found unexpected openings, trap-doors and other contrivances by means of which separate floors could be thrown into one, and large scenes could be handled without bending or crumpling them. The studio in which the painting is done has a stage in it which can be used when required for rehearsal. It is not unusual for a theatre company to go up to the studio and rehearse with the scenery before it is entirely finished. That allows the artist in charge of the work an opportunity to make such changes in detail as may be suggested to him by the movements of the actors. Sometimes, when the artist is in doubt, he dresses up his carpenters, typewriters, office boys, and even calls in the butcher's and grocer's boys from the neighboring stores, dresses them in suggestive costumes, and makes them rehearse an act or two, and thus give him a clear idea of the appearance of a scene in conjunction with the performers. This was done not long ago in connection with some scenery painted for a play in which the taking of the Bastile is depicted. Armed with old poles, and with canvas lapped around them instead of regular costumes, the makeshift people took their positions as directed by the artist at the front of the door of the Bastile, which was put up in position on the stage, and began the preliminary movements toward breaking it in. The artist secured some valuable ideas, and finished the scene, which had bothered him a great deal, without further difficulty. Before any work is done on the scene at all the chief artist lays it all out in miniature. This is done in another room in the building. The artist having received verbal instructions from the theatre manager, first makes pencil sketches of the various scenes, which he submits to the manager. When the sketches are satisfactory they are elaborated and laid in water colors. The artist is as clever with his fingers as with his brush, and with a pair of shears and some pasteboard he cuts up the scenes as he wants them and pastes the water colors on them. A little stage, built for the purpose, and with holes in which pegs supporting the pasteboard scenes can be fitted, is then used. The artist has, of course, read through the play, and he now rehearses it, as far as the scene shifting is concerned, until he himself is thoroughly satisfied. Then he calls in some assistants, and together they go over the scenes. The stage has all the details of the theatre stage. It has a curtain, footlights, boxes at the sides, and places for hanging the scenes. The rehearsal by the artist and his assistants is just as thorough as though an audience were present. In fact, an imitation audience is provided. When everything is ready the first scene is set, the curtain is pulled down, the stage is put on a table and the audience is placed in front of it. The audience consists of a lot of little pasteboard figures in seats, and the auditorium is arranged as nearly like that of the average theatre as can be. A large pasteboard wall rises back of the audience, and this has two little holes in it protected by pasteboard flaps. Through these holes the artists view the scenes. The curtain is rung up and the scenery is criticised just as it would be by the average audience. Sometimes the play is read so as to carry out the idea more completely. The peep-holes are so arranged that a view of the scenery is obtained not only from the centre but from the sides, and it is criticised from every point. Each scene is taken in turn and examined critically. If satisfactory, the theatre manager is called in to see it, too. Sometimes the scenes have to be made over in miniature many times before they will answer the manager's purpose, but no work is done on the real scenery until the manager has given his approval of the miniature. After he has once done that, he has no longer any voice in the matter. The miniature scenery has all been prepared on a certain scale, and, having been accepted, is turned over to the scene painter. The usual proportion of miniature to actual size is one half inch to two feet. The painter's first work is to lay out his canvas in squares of two feet. Then he takes up the first scene, and, following the colors in the miniature as closely as possible, begins on the actual work of painting. Scene painters have to serve a long apprenticeship before they become experts. Some of them receive very large pay, and the average make $2,500 a year. All scenes that are painted are more or less difficult to handle because of their size and bulk, but of recent years a new process of preparing scenes has come into vogue which may some day supplant painting altogether. In this dyes are used. The chief difficulty with painted canvases is that the canvas is made very heavy by the paint on it, and has to be rolled on poles to keep it from being crumpled and cracked. Where dyes are used the canvas is no heavier after it is finished than before it was treated, and can be folded and crumpled as much as required, without injuring it in any way. The only difficulty at present lies in the perfecting of this process so that the effects will be just as good as where paint is used. When the reporter was in the studio a forest scene was being painted. Even in the daylight the trees and foliage looked very natural on their white background. "We are going to make this as near natural as possible," said the artist, "and all the white is going to be cut out. That will leave only the trees and the foliage, and in order to keep that in position a web of dark threads will be pasted onto the canvas holding the severed portions together." After a scene is finished it is usually photographed, and these photographs are kept, so that when a scene is destroyed it can be duplicated without waste of time. This is made necessary by the accidental destruction of scenery at times when it is very necessary to replace it in a hurry. A manager whose scenery is burned out in Duluth may telegraph an order for its duplication and have no more bother in the matter. In connection with the scene paintings in the studio may be seen the making of what is called relief work. The realism of stage scenery of to-day has brought into being an industry which requires skill and experience. The theatre goer who marvels at the beauty of the furniture and decorations in some of the stage setting of to-day would probably be surprised to know that much of this is papier-maché work. This is by no means inexpensive, however, the mantel and relief decorations in one scene of "The Heir at Law" costing over $2,000. A great deal of expense is incurred in securing the models for this work. Sometimes the artist has to make models in clay. A mould is made from the model, and this is in turn filled with the papier-maché, which hardens and comes out in the shape required. Papier-maché is made of reddish paper, containing no sizing. It is soaked, and put into the mould in small pieces. There is ornamentation on the outside of the building which is the product of the papier-maché artist, and although it has been exposed to all sorts of weather for two years it is as good as new. Besides the stage furniture and decorations the papier-maché department turns out large quantities of scenic backgrounds and furniture for photographic studios. The trees, rustic fences, rocks and other backgrounds, which appear in some photographs, are all papier-maché, and many of them come directly from this studio. The reporter came very near turning an involuntary somersault when he casually leaned against what appeared to be a solid trunk of a tree. It was as light as a straw, and if the reporter's guide had not grabbed him he would probably have fallen into the vat in which the paper was prepared. A number of orders from distant parts of the world were being filled at the time, and the artist told the reporter that orders had been received from India, various parts of Europe, and Cape Colony. In making these backgrounds it is very essential for the artist to know on which side of the photographic studio the light enters. Before making up any orders, therefore, this point is carefully inquired into. There have been turned out at the studio recently a number of backgrounds and scenes for a photographic studio which will be used in a photograph illustrating the first twenty-seven lines of the poem "Elaine." This photograph will enter into the competition for the prize offered by the Photographers' Association of this country.

GERMAN ELECTRICIANS.

THE PROGRESS OF ELECTRIC SCIENCE IN EUROPE.

Experiments are now going on in Germany, with electric currents of very high tension, which have a good deal of interest to architects, who are called upon, each day more and more, to plan and direct the introduction of electric appliances in their buildings. Every one will remember, says *The American Architect*, the somewhat acrimonious discussion of a year or two ago about the danger of alternating currents of electricity at one thousand volts pressure, and the proposition of a company in England to use a ten thousand volt current was looked upon as wildly reckless. Now, however, a line is in process of construction to carry a current of twenty-five thousand volts. The line is to be about a hundred miles long, and is to extend from the Falls of the Neckar, at Lauffen, to Frankfort-on-the Main, along the railway route, through Heilbronn, Jaxtfeld and Hanau. It is to be used to convey a force of about three hundred horse-power, obtained from the cataract by a turbine wheel, to the building of the electrical exhibition in Frankfort, and the object of using a current of such high tension is to reduce the cost of the wire, under the rule that the smaller the wire the greater the resistance, and the higher must be the electrical pressure of the current to force its way through it. The current is obtained from a dynamo which delivers it at a pressure of one hundred volts, and is passed through a transformer, which changes it into one of much higher tension. On arriving at its destination, a second transformer changes the current back again into one of one hundred volts, suitable for actuating motors and for feeding incandescent lamps. In the experiments which have already been made, the two transformers were connected to dynamos, a wire about three miles long being stretched between them, passing in various directions about the territory connected with the station. On setting the dynamos in motion, a current of thirty-three thousand volts, as measured by a Thomson voltmeter, was developed, which was reduced without difficulty to one hundred volts by the second transformer. A trial was then made to determine how great would be the tendency of such a current to leave the wire, it having been asserted that a far more feeble current would jump several feet from a wire, to strike a man standing below. With this object, the wire was cut, and the two ends cut brought slowly together. Under a difference of tension of twenty-two thousand volts between the two pieces of wire, no spark forced its way across the intervening space until the ends had

been brought within twenty-two millimeters of each other—less than an inch. Another experiment was tried, to see whether the ordinary safety cut-off could be used with so strong a current. A ball of lead was interposed in the circuit, and the effect of the fall of a loose wire, or of a tree, was imitated by dropping a piece of wire across the circuit. The short-circuiting thus caused was instantly felt by the lead ball, which melted, with a flash and small explosion, cutting off the current.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEAT.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobsters, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, watercress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

LYONNAISE TOMATOES.—Slice four medium-sized onions and fry them in butter until they are just beginning to become yellowish, stirring often to prevent burning; then pour into the pan six large tomatoes, peeled and cut into small pieces; season highly with salt and pepper, and cook for twenty minutes, stirring frequently; add a tablespoonful of minced parsley and half a pint of stock or gravy, and simmer for five minutes; thicken a little with flour rubbed smooth in water and serve.

HERRING SALAD.—Boil and peel some good firm potatoes and cut them into dice, or slice them. Pick a small herring into bits and mix it with the potato; grate a little onion over both, and serve with French dressing.

FRIED CODFISH STEAKS.—Select a medium sized fresh codfish, cut it in steaks crosswise of the fish about 1½ inches thick, sprinkle a little salt over them and let them stand two hours. Cut into dice a pound of salt fat pork, fry out all the fat from them and remove the crisp bits of pork; put the codfish steaks in a pan of corn meal, dredge them with it, and when the pork fat is smoking hot fry the steaks in it to a dark brown color on both sides. Squeeze over them a little lemon juice, add a dash of freshly ground pepper, and serve with hot, old-fashioned, well-buttered Johnny cake.

SCRAMBLED EGG AND TOMATOES.—Put a little olive oil into a frying-pan, and when it is very hot add the pulp of two tomatoes and a quarter of a small onion chopped fine, and one or two green Chili peppers cut up very fine; add salt and pepper; cook for a couple of moments, then break two eggs into the pan, mix all together and pour onto a hot dish, and serve at once.

RHUBARB DUMPLING.—Make a nice paste of one pound flour, one-quarter pound suet, two teaspoonfuls baking powder, salt, and sufficient water to make it not too stiff. Line a bowl with the paste, fill it with rhubarb that has been sweetened and half cooked. Put a cover of paste on the top of the bowl, wetting the edges so that the two pastes will stick together. Flour a cloth and tie it about the bowl, and boil for three hours. Serve with a sauce of powdered sugar and butter beaten together.

OYSTER PLANT CROQUETTES.—To three quarts of cold water add a gill of vinegar; scrape and throw into the water the oyster plants as fast as cleaned. Drain and plunge them into boiling water slightly salted; boil fifty minutes; drain and mash them thoroughly; season with salt, pepper and butter, and bind together with yolks of eggs; roll them in cork shapes, dip in egg batter and then in crumbs, and fry in a liberal quantity of hot fat. Throwing the roots in water containing vinegar prevents them from turning black after they are scraped.

LEMON CREAM FOR CAKE FILLING.—Grate off the very top of the rind of five fine fresh lemons onto a cup of sugar, and put it in a saucepan; break in four eggs and beat well all together, then add a quarter of a pound of butter and set it on the side of the stove, where it will cook but not burn; stir frequently. Cut the lemons in half and squeeze the juice into a bowl, carefully taking out the seeds; when the cream is cooked a little add the juice, and stir constantly until it thickens; then put away in a jar to cool before using.

PLANKED SHAD.

HOW THE FAMOUS DISH IS PREPARED ON THE BANKS OF THE DELAWARE.

This is the time for "planked shad," and hotels and restaurants which are supposed to make a specialty of this delicacy have it announced in large and alluring letters on their bills of fare and in their show windows. The shad season itself is a little on the wane. Fulton Market is crowded with the fish, and boarding houses are having it with apocryphal strawberry shortcake and chocolate éclairs for Friday dinners. Shad begin to run in February in Southern waters. The best, however, comes from the Delaware and North Rivers. The Connecticut River shad are due next week. They herald the end of the season. It was only about four years ago that restaurants began advertising "planked shad." The fame of this method of preparing the fish had come from enthusiastic fishermen who had partaken of it on the Delaware. The fish are taken alive and silver skinned from the nets on the Delaware, and there is the golden opportunity. A planked shad, like a boiled lobster, must be almost cooked alive. A fire of wood and brushes, a half dozen of the shimmering fish, a quick motion of a sharp knife in each and they are disemboweled and ready for the fire. Great flat blocks of oak or pine upon which the fish, split in half, the skin towards the wood, complete the preparation. The fish are roasted in the ashes, and when ready the feast is fit for the gods. The pompano is the king of Southern waters, the shad the royal fish of the North. With either but one wine should be drunk, and that should be cold, amber colored and extra dry. The planked shad of the restaurant is another thing. Along the Delaware they have been eating the only planked shad since before Washington crossed that historic stream. Four years only has it been known in the North, and already a firm manufactures the "only genuine planks for shad," each of which is duly stamped, and they are patented as an invention. The wood comes from North Carolina, and there is an impression that shad can be properly planked only upon oak from that State. The patented plank is smooth and perfectly square. The fish is placed on this piece of board in the same manner as on the banks of the Delaware. But here all remembrance ceases. It is thrust into an oven or a hot coal fire and baked. Sometimes a gas stove is used. The surroundings are the four brick walls of a New York restaurant kitchen, and the consumer munches bread and drinks ice water on a correctly laid table until his fish is brought in. "We have a great deal of trouble with people," said a head waiter in a restaurant recently, "because they insist on taking their planks away with them. That never does, you know. Planks cost, and we can use them some ten times over. We have prepared planked bluefish and we are thinking about planked lobster, and later in the season we may see what can be done with clams."

NICKEL AND SLOT.

THE USE OF VENDING MACHINES IN AMERICA.

It is five years since P. Everitt, of London, England, introduced in America the first practical vending machine. Prior to this the vending machines were almost unknown, and the few that were put out for selling goods were of such poor construction and design that public honesty had to be relied upon to insure receiving money for goods delivered by the first rude machines. With P. Everitt's machine came a change. The confidence placed with the public in vending machines as conveniences, and giving them proper care, had been very imperfect, and occasioned heavy losses of money to those who were disposed to give machines a proper chance to do what might be expected of them. P. Everitt's invention was designed to correct the mistakes of former inventors, and to place before the public a machine that could not be robbed nor cheat the customer. The Automatic Machine Co. of New York was formed to handle Everitt's machines; and many of them were made and put out, but, as ever, the skilled robbers soon struck terror to the new enterprise. The wealthy company, however, were not to be driven from the field. With the assistance of F. M. Leavitt the machines were improved, again the public showed the upper hand, and the fight between inventors and robbers became warm. Hundreds of improvements were patented, and those of C. F. Redon and H. Bailey found popular favor, and for many months held out against mischief searchers. The company then had thousands of machines built, and were proceeding to gather their first harvest when, alas! again it was found that the mischief makers were ahead. During this time many other machine companies had commenced work, only to meet with the same disappointments, and the vending machine business seemed generally imperilled. No one had yet been able to meet the connivances of the 14-year-old boys who, by the skilful use of strings, glue, wire, etc., where playing sad havoc with the profitable part of the business. The existing companies were not able to show a balance in their favor. Many thousands of dollars had been spent, with scarcely anything but inferior machines to show where it had gone, and many inventors had quit the field from necessity. Then suddenly from the West came a surprise to the skilled machine robbers. J. A. Williams, of Kansas City, who had spent years in experiments, subjected a machine to the severe test of the same people who had thwarted the good intent of a dozen inventors. For weeks a few of these machines were up in what past experience had shown were the hardest places in New York for a machine to live. For the first time in the history of vending machines the cunning cleverness of these localities had been met, which proved it possible to make a machine that would have fair play on both sides, neither cheating nor being cheated to an appreciable extent. Then followed the formation of the Williams Automatic Machine Co., and building of machines was taken up in earnest, and many thousands have been built. Improvements have been added wherever desirable, until the public again have confidence in the machines, as shown by the large patronage when articles of merit are sold. In an interview with Mr. E. F. Bradford, 24 Union Square, New York City, who is the manager, for New York, Long Island and New Jersey, for Walter Baker & Co.'s chocolate machines, he said the superiority of the Williams machine is no longer questioned. As to the result, whether profit or loss, now rests with the merit

of the goods sold. As to our goods, we have been very successful, having an article that is known the world over. The first goods sold in this way by machines were the output of Adams & Sons, the Tutti-Frutti chewing-gum makers. Before them, however, Schilling & Stollwerk had some of their confectionery on sale in this way, but the goods apparently not being desirable the scheme was a practical failure. Everything in the way of success of these machines depends upon the quality of the goods sold. No one can be humbugged twice, and in this respect the machines are just like stores. The public demands value for its money. Such firms as Walter Baker & Co., who cannot afford to risk their reputation, have no difficulty in gaining and retaining public confidence. There have been innumerable articles sold through automatic machines, such as pens, postage stamps, note paper and envelopes, cigars, cigarettes, cologne, and even accident insurance policies. The automatic machines have also been employed to weigh, tell fortunes, offer two hands of cards, give electric shocks, imitate horse races, gambling, throw dice, make tintypes, try strength, exhibit the microscope, indicate lifting power or the strength of a blow, measure the expansion of the lungs, and to work the phonograph, but as the novelty gradually wore off they ceased to be profitable. The receipts of these machines vary according to what is offered through them, the place where they are located, and many other circumstances; but when their cost is considered, which ranges from $10 to $150, it may be appreciated that it does not take very heavy receipts to pay a good interest on the investment.

CHLORINE.—Liquid chlorine is, according to *The* (London) *Gas World*, now supplied as an article of commerce by the Badische Anilin und Soda Fabrik, Ludwigshafen, on the Rhine. Herr Knietsch has been investigating its physical properties. In thick layers it is orange-yellow; in thin, yellow. It completely absorbs blue and violet rays, allowing red, orange, yellow, and green to pass.

HOUSEHOLD SERVANTS.

THE VEXATIOUS PROBLEM VIEWED FROM TWO STANDPOINTS.

A correspondent of the *Journal of Commerce* sends that paper a plea for some consideration of the servant-girl question. He gives a most touching account of a domestic who served in his family for eight years with such fidelity that she was held in high esteem by all its members, and when, with a nice sum in the savings-bank she left to be married, she was followed to her new home with the strongest tokens of their affection. This is a beautiful picture, says our contemporary, and not quite as rare, perhaps as many would have us believe; but how to make it the history of a common experience is a problem not easily solved. If we admit that there is a serious fault on the part of the one side or the other, or of both; and if we could apportion the blame fairly between the two, we should be no nearer a settlement of the difficulty. When our correspondent hired his faithful domestic she was engaged at her asking price, which was seven dollars a month. The wages of such helpers has nearly or quite doubled since that day. The writer asks if there is any reason for such an advance. The board is furnished, and therefore the cost of living, whether less or more, does not enter into the question of the rate of pay. The other necessary expenses are probably no higher, taking all things into consideration, now than then. It does cost more to dress the average servant-girl now than it did thirty or forty years ago, not because the same articles are more expensive, but because the style of attire has undergone a material change. The calico that would "wash," and the plain fabrics which than composed the one better dress, can be had for less money, but the girl is not content with these. She must have expensive materials made and trimmed in the most fashionable style. The shawl that then cost only a month's wages and would last for years is superseded by a cloak or other made garment costing three or four times as much, and this will do only for one or two seasons. A fashionable hat or bonnet exchanged or renewed twice a year takes the place of the simple covering of the head with its one ribbon, made into a dainty bow, that once sufficed. Does any one say that servants dress above their station, and that this is a matter needing a speedy and thorough reform? If we answer in the affirmative we shall be met at once with the fact that the extravagance did not begin in the kitchen, and the reform cannot be set on foot from that at a starting point. There is no wider difference in the attire of the servants, comparing 1850 with 1890, then there is in the wardrobe of the mistress. The former is only a copy or imitation of the latter. The servants will not go back to calico and plain delaine while the mistress and her daughters shine in silks and satins, and dainty robes, and costly furs. The reform to be effective must begin up stairs. We undertake to say that when the majority of employers will spend no more for their outfits than they did at the date suggested as a standard, the kitchen domestics can be won to the same measure of economy. But the difficulty is not wholly or mainly in the cost of attire. It is, no doubt, true that inordinate vanity fed by rich dresses, fine cloth or velvet cloaks, and hats gay with flowers and tossing plumes, disqualifies a domestic in some measure for respectful service and the plain, hard work of the household; but the chief reasons for the tone and temper found to be most objectionable lie beyond the outside garments. It requires special grace to be a servant. Not alone in the household, but in the State and throughout the world, the great need is service. "I am among you as one that serveth," said He who in His nature was "Master and Lord." A quaint old writer declares that "We are free and equal" is the lie that sent the rebellious angels to their sad estate; and it is this pride that unfits so many of the human race for their proper calling. The law of the universe, from the throne of the Highest to the minutest atom, is one of subjection, and willing service is the only perfect obedience. They who deny the doctrine of man's fall and his consequent innate depravity can give us no explanation of the fact so patent to the commonest observation, that down to man and below him the law is obeyed, and in the whole range of our vision he is the only rebel to whom, while he remains unchanged, all obedience to another is a hardship requiring constant self denial. Faithful service cannot be bought with money. It must be prompted from within, and only love can inspire and secure it. Wherever we have an instance of untiring devotion on the part of a servant, it will be seen that there is a real attachment between the laborer and the employer. The domestic, working for hire in the mer-

Buffalo Lithia Water, Spring No. 2, in Bright's Disease, Gout, Stone in the Bladder, and Diseases Generally of Uric Acid Diathesis, Etc., Etc.

DR. WM. A. HAMMOND, of Washington, D. C., Surgeon General U. S Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the BUFFALO LITHIA WATER in cases of AFFECTIONS of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. *The results have been eminently satisfactory.* Lithia has for many years *been a favorite with me in like cases, but the* BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION of THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from OVER MENTAL WORK—in which the condition called NERVOUS DYSPEPSIA exists—*and generally with* MARKED BENEFIT."

DR. WM. B. TOWLES, Professor of Anatomy and Materia Medica, in the Medical Department of the University of Virginia.

"BUFFALO LITHIA SPRINGS, No. 2, belongs to the ALKALINE or, *perhaps, to the* ALKALINE SALINE Class, *for it has proved far more efficacious in many diseased conditions than any of the simple* ALKALINE waters.

"*I feel no hesitancy whatever in saying that in* GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE *in the* BLADDER, and in all diseases of URIC ACID DIATHESIS, *I know of no remedy at all comparable to it.*

"*Its effects are marked in causing a disappearance of* ALBUMEN *from the urine. In a* single case of BRIGHT'S DISEASE *of the* KIDNEYS, I witnessed *decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of this disease.* In DYSPEPSIA, especially that form of it in which there *is an excessive production of* ACID *during the process of nutrition*, in some of the PECULIAR AFFECTIONS *of* WOMEN, notably in SUPPRESSION of the MENSES, and in CHRONIC MALARIAL POISONING, etc., I have found it highly efficacious."

DR. G. HALSTEAD BOYLAND, late Professor of Surgery, Baltimore Medical College, late Surgeon French Army (Decorated), Member Baltimore Academy of Medicine, Member of American Medical Association.

"In BRIGHT'S DISEASE of the KIDNEYS, ACUTE or CHRONIC, BUFFALO LITHIA WATER, Spring No. 2, is, in my experience, *without a rival*, whether in the PARENCHYMATOUS form or INTERSTITIAL NEPHRITIS. In cases in which the ALBUMEN in the URINE reached as high as 50 per cent., I have known it under a course of this water gradually diminish and finally disappear, at the same time other alarming symptoms were relieved and the sufferers restored to health.

"In STONE in the BLADDER of the RED LITHIC ACID and the WHITE PHOSPHATIC DEPOSIT, the SOLVENT power of this water is *unmistakable*."

Water in cases of one dozen half gallon bottles, $5.00 f. o. b. here.

THOS. F. COODE, Proprietor, BUFFALO LITHIA SPRINGS, VA.

cenary spirit, cannot reach even the lowest ideal of perfection, and must come far short of the ministry which the comfort of the household requires. The girl in the kitchen, the chamber or the laundry is thinking only of keeping her place at the smallest outlay of energy and the least personal inconvenience. There is no question in her heart of how much she can do to make the home happy and to anticipate every reasonable wish of her employer, but, on the other hand, of how many privileges and exemptions she can secure by persistent stipulation. She is not peculiar in this; it is the effort of imperfect human nature the world over, which is always crying "Give, give," and not, as in the law of service, "What can I possibly add by my personal ministry to the sum of human happiness?" It is useless by organization or combination among employers to better this state of things through the application of external force. It needs conversion and a change of heart, and this is never reached in any case by intimidation or outside pressure. If there is any truth in the gospel story, men are to be renewed in their being by the exhibition and attractive force of a self-denying and suffering Love that seeks after them with infinite tenderness and patience, and woos them at last to accept its reforming ministry. Suppose that they who seek for loving service in their households should imitate this blessed example. Some one may say that it will not be successful. Not always, certainly, for how often are the masters and mistresses themselves indifferent to the voice evermore sounding in their ears and to the pleading of One that knocks at the door of every heart! We asked a lady who was complaining that she never had a faithful domestic, or one for whom she had the least personal regard, if she had ever sought to win the attachment of a servant with the loving tenderness and forbearance that had turned her own heart heavenward! She burst into tears at our question, and said that she had never thought of it! We added that it might be met with insolence; that it might be regarded as an exhibition of weakness; that it might be taken advantage of by the servant as showing a want of dignity and a failure to assert a proper authority. In short, that it might be treated as those who never worked as household drudges too often meet the proffers of a Divine compassion. But even so it is worth trying. It is the more excellent way. He that would have friends must show himself friendly. He that would secure service to himself must give himself up to loving service wherever he can make his ministry a means of good to others. Servants in the kitchen have the same hearts that beat under satin in the parlor, are subject to like passions, and are melted into fruitful devotion by the same ministry of love. Is not the experiment worth the effort when the object to be gained is so important?

Indigestion

Horsford's Acid Phosphate.

A preparation of phosphoric acid and the phosphates required for perfect digestion. It promotes digestion without injury, and thereby relieves those diseases arising from a disordered stomach.

Dr. E. J. WILLIAMSON, St. Louis, Mo., says: "Marked beneficial results in imperfect digestion."

Dr. W. W. SCOFIELD, Dalton, Mass., says: "It promotes digestion and overcomes acid stomach."

Dr. F. G. McGAVOCK, McGavock, Ark., says: "It acts beneficially in obstinate indigestion."

BUSINESS NOTES.

UNCLE SAM BUYS IT.

On May 7, 1891, the contract for supplying the U. S. Army with baking powder was again awarded the Cleveland Baking Powder Co. The fact that the Government requisition calls for baking powder "equal in quality to Cleveland's" is a high tribute to the great merit of the powder. Cleveland's is the standard.

HORSFORD'S ACID PHOSPHATE

Makes delicious lemonade. A teaspoonful added to a glass of hot or cold water, and sweetened to the taste, will be found refreshing and invigorating.

DR. D. SCHAUB, Muncie, Ind., says: "Have used it in bilious disorders and it did all that was desired. I think it an invaluable remedy."

A COMMERCIAL PARADOX.

Gordon & Dilworth, the well known fruit packers and preservers, some two years since, got so far behind their orders that they were compelled to stop all their advertising. They intended to resume the next year, but found that they had so firmly established themselves that they could sell all the goods they could make without advertising, until they could increase their manufacturing facilities. This, however, proves that judicious advertising brings trade, but that only good goods can retain it.

GRAND PREMIUM OFFER!
A SET OF THE
WORKS OF CHARLES DICKENS,
In Twelve Large Volumes,

Which we Offer with a Year's Subscription to this Paper for a Trifle More than Our Regular Subscription Price.

CHARLES DICKENS.

Wishing to largely increase the circulation of this paper during the next six months, we have made arrangements with a New York publishing house whereby we are enabled to offer as a premium to our subscribers a **Set of the Works of Charles Dickens, in Twelve Large and Handsome Volumes,** with a year's subscription to this paper, for a trifle more than our regular subscription price. Our great offer to subscribers eclipses any ever heretofore made. Charles Dickens was the greatest novelist who ever lived. No author before or since his time has won the fame that he achieved, and his works are even more popular to-day than during his lifetime. They abound in wit, humor, pathos, masterly delineation of character, vivid descriptions of places and incidents, thrilling and skillfully wrought plots. Each book is intensely interesting. No home should be without a set of these great and remarkable works. Not to have read them is to be far behind the age in which we live. The set of Dickens' works which we offer as a premium to our subscribers is handsomely printed from entirely new plates, with new type. The twelve volumes contain the following world-famous works, each one of which is published *complete, unchanged, and absolutely unabridged:*

DAVID COPPERFIELD,
MARTIN CHUZZLEWIT,
NICHOLAS NICKELBY,
DOMBEY AND SON,
BLEAK HOUSE,
LITTLE DORRIT,
OUR MUTUAL FRIEND,
PICKWICK PAPERS,
BARNABY RUDGE AND CHRISTMAS STORIES,
OLIVER TWIST AND GREAT EXPECTATIONS,
THE OLD CURIOSITY SHOP AND THE UNCOMMERCIAL TRAVELER,
A TALE OF TWO CITIES, HARD TIMES AND THE MYSTERY OF EDWIN DROOD.

The above are without question the most famous novels that were ever written. For a quarter of a century they have been celebrated in every nook and corner of the civilized world. Yet there are thousands of homes in America not yet supplied with a set of Dickens, the usual high cost of the books preventing people in moderate circumstances from enjoying this luxury. But now, owing to the use of modern improved printing, folding and stitching machinery, the extremely low price of white paper, and the great competition in the book trade, we are enabled to offer to our subscribers and readers a set of Dickens' works at a price which all can afford to pay. Every home in the land may now be supplied with a set of the great author's works.

AMERICAN ANALYST.

We will send the **ENTIRE SET OF DICKENS WORKS,** *in* **TWELVE VOLUMES,** *as here described, all postage prepaid by ourselves, also* **THE AMERICAN ANALYST** *for* **ONE YEAR,** *upon receipt of* **$1.50,** *which is only* **50** *cents more than the regular subscription price of this paper.* Our readers, therefore, practically get a set of Dickens' works in twelve volumes for only **50** cents. This is the grandest premium ever offered. Up to this time a set of Dickens' works has usually been $10.00 or more. Tell all your friends that they can get a set of Dickens' works in twelve volumes, with a year's subscription to **THE AMERICAN ANALYST** for only **$1.50.** Subscribe now and get this great premium. If your subscription has not yet expired, it will make no difference, for it will be extended one year from date of expiration. We will also give a set of Dickens', as above, free and post-paid, to any one sending us a club of three yearly subscribers.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

To Subscribers, Readers and Advertisers.

SUBSCRIBERS' attention is called to the great variety of interesting and instructive subjects treated in this number. We respectfully ask the co-operation of our subscribers in extending our Subscription list, which will enable us still further to increase the value of the AMERICAN ANALYST to them.

The CASUAL READER is specially requested to examine our liberal premium offer.

ADVERTISERS who do not know of this Journal already, are respectfully referred to article headed "A Business Benefit."

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any newsdealer will take orders for it, the American News Company being our wholesale agents. All postmasters will receive subscriptions.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

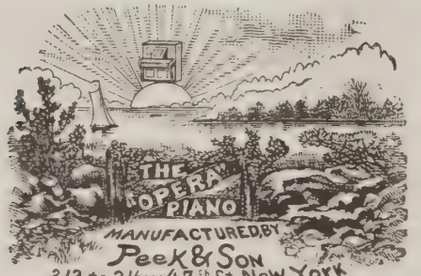
Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.



Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

GREENLAND EXPLORATION.

Some further details are announced regarding the projected Arctic exploration to be conducted by Civil Engineer Robert E. Peary, U. S. N., which was mentioned in these columns some weeks ago. As then stated Mr. Peary in 1886 sailed on a whaler to the west coast of Greenland, and thence crossed the glaciers in an easterly direction for about one hundred miles. Mr. Peary's object was to demonstrate the feasibility of traveling in Greenland on top of ice and snow. His forthcoming expedition is founded upon the knowledge he gained then. About June 5, accompanied by Mrs. Peary, a negro servant and several scientific men whose names have not yet been made known, Mr. Peary will sail from here on a Danish steamer especially built for the Arctic seas. They will go up the west coast of Greenland to Whale Sound, which is not far south of Smith Sound, famous in many polar expeditions. It is expected that Whale Sound will be reached early in August. The rest of this season will be spent in putting up Winter quarters on the shore, laying in a store of meat, collecting specimens, making inspections of the inland ice, and, if the weather should be favorable, establishing an advance depot of supplies near the southern angle of Humboldt glacier. Next Winter will be passed in a house near the head of Whale Sound putting the sledges together, preparing the clothing and traveling equipment and carrying on snowshoe and skier practice. It is very important that the members of the expedition should be experts with skiers, for much of the traveling will probably have to be done on them. As early as possible in the Spring of 1892, Mr. Peary and his party will try to reach the north end of Greenland, using the inland ice as a highway. They will first go to Humboldt glacier, thence to the head of Peterman Fiord, where a second depot of supplies will be established; thence along the inland ice, keeping in sight of the west coast, if possible, to the head of Sherard Osborn Fiord, where a third supply depot will be made; thence to the head of De Long Fiord, which will be made a fourth depot and thence to the northern end of Greenland, if it should be possible. The American Geographical Society has contributed $1,000 toward the expenses of the expedition. The Academy of Natural Science bears a portion of the expense, which in all will not be more than $7,000. Mr. Peary is about 34 years old, a native of Maine, of tough and wiry physique, and he has trained himself particularly for Arctic expeditions. He was for two years engaged in the preliminary surveys for the Nicaragua Canal, and until recently was the civil engineer at the League Island Navy Yard. The Navy Department has granted him a furlough in order that he may go upon this expedition.

A SOLEMN DOUBT.

In a recent issue the *New England Grocer* propounded editorially the stupendous proposition: "Can a man keep a grocery store and be a Christian?" As the editor of that enterprising journal is an expert in at least the grocery end of the matter the fact that he leaves the riddle unanswered, suggests the suspicion that he found it embarrassing to enter too deeply into the discussion. In the meantime the wide-awake public will entertain its own views on the subject, which, perhaps, will not be wholly untinged by local bias. If the question, for instance, were to be propounded in New York, we fear there is a numerous element here that would give it an earnest and cheerful negative response. The grocer's profession in this metropolis is not sustained on even a parallel plane with cleanliness in the proverbial proximity to sanctification which that latter admirable attribute enjoys. It would not indeed be overstating the matter to declare that here the grocer and godliness are the moral antitheses of each other. Sufficient evidence of this unfortunate state of things was afforded by the recent "Food and Health" farce enacted in this city, where an unsuspecting and guileless public were cozened into divesting themselves of a large sum of money through the working of a wholesale and unscrupulous advertising scheme in which among a few reputable dealers many of the principal "snide" concerns in the city were represented, together with a striking array of country circus "side shows." The details, however, we have already published. Emboldened by success, the projectors of that absurdity now propose to develope their three weeks free lunch advertising dodge of last April into a permanent enterprise of similar character, having as its ostensible purpose the educating of the public in the matter of pure and wholesome food. The real purpose, judging as we are justified in doing from last month's manifestation, will be to attract attention to the persons who hire (and pay for) concessions of space for the exhibition of their wares. "Pure food" will mean whatever is advertised to the public eye through this scheme, and the public health will be the subject of about as great solicitude as the Constitution of the Argentine Republic. We do not wish to be unjust. What we say about the moral inefficacy of the grocer is intended kindly. We like him personally, whatever prejudices we may have against his watered milk, his sanded sugar, his glucose syrup, his bread-toast coffee—and to condense in a word an interminable list, his eccentricities generally, which, like the man's wooden leg may have been inherited and unintentional. But with all our affection for him, individually, we cannot reflect upon him as a class without repeating the unanswered conundrum of our New England contemporary. The supreme absurdity of this new project is the name by which they propose to designate it, "The Healtheries." Has English dudeism such a hold upon this community that it must find vent through the grocery store? We shall expect next to see the grocer's boy equipped in stunning collars and plaid gaiters, balancing his package of codfish and turnips on one arm while with the other he is swinging his huge-headed cane with the ferrule held carefully uppermost. The word is confessedly imported from London, and is as absurd as its projected application. Its only recommendation is its alliterative aptness. The grocer is not wholly unsuspected of stealthery, leading presumably to wealthery, of which a fresh instrument is, he hopes, the forthcoming healthery.

HOURS FOR STUDY.

Do our school children devote sufficient time to study? A writer in the Boston *Transcript* calls attention to the fact that in a recent magazine article Professor Montague of Amherst College asserts that a French boy in a Paris lycée spends, out of the twenty-four hours of the day, nine hours in sleep, three and one-quarter hours at meals and in recreation, four hours in recitation, and seven and three-quarter hours in study. A boy in the Boston Latin School, a school

of corresponding grade, spends three and one-third hours in recitation, and three required hours in study—one in school and two at home. This explains in part why a French boy of eighteen is more advanced than an American boy of eighteen. And yet our boys seem to be as many hours over their books as their health will bear. Perhaps they lack training for the concentration of their powers both in work and in exercise.

WOMEN'S WORK.

THE MANIFOLD OCCUPATIONS OPEN TO WOMEN IN FRANCE.

(*Concluded from page* 242.)

In the professional schools the instruction is entirely free, but the number of pupils is limited. The ages range from 13 to 18, and only French candidates are permitted. In these schools the pupils cannot live on the premises. The scholars are taught trades, such as fine white sewing, ironing, stay making, artificial flower making, millinery, dress-making, and so forth, as well as household work. There are also classes for cooking and washing, and the pupils are further taught how to market with advantage. The number of pupils varies in the different schools, but none admit more than 200 at a time. To these professional schools commercial classes are attached, which are held in the evening. Here book-keeping is taught (double entry). The school for the professional education of young girls, founded by Elise Lemonnier, has produced excellent results. In the Philotechnique Association a section named after Victor Cousin is also open to women. The classes are held in the evening, and there are no formalities for entrance. The high schools for women comprise the Normal School at Sevres, twenty-six lyceums, of which two are in Paris, and twenty-six colleges. The educational curriculum differs from that for boys. For entrance the highest French diploma is required, or a foreign one that answers to it. The candidate must not be less than 21 years of age, and must submit to the preliminary trials fixed by the law of 1860. The salary of the directresses is fixed at a minimum of 6,500 francs ($1,300), and that of the under teachers at 1,400 francs ($280). For the schools in Paris the salary is slightly higher. The stewards, or rather clerks, of the high schools must pass two years' apprenticeship in one of them, and must produce a certificate. Five years' service is necessary before they can receive promotion. At Sevres the mistresses have board, lodging and washing free. The teachers of drawing receive from 1,600 ($320) to 3,000 francs ($600) a year, in return for which they must give sixteen hours' teaching a week. They are paid extra for supplementary lessons. The teaching of gymnastics is also confided to ladies in the girls' schools. They must have a certificate of competency and give at least twelve hours' lessons a week. The salary is from 1,600 ($320) to 2,000 francs ($400), and sixteen hours' service may be required of them every week without extra pay. The date of the *concours* for these posts is fixed every year by the Minister of the Interior. Besides the usual documents, aspirants must produce a medical certificate of their physical capacity. The average salary of a governess is from 1,200 francs ($240) a year, but as this is a private matter it, of course, varies, according to the generosity of the particular family in which she is employed. The Bank of France employs a very large number of women as accountants in the classification of bills, in the classification of coupons, and in the department of printing and binding. The ladies employed in this category are called *dames titulaires.* They are paid 3 francs (60 cents) a day, and are required to pass a preliminary examination in writing, spelling and arithmetic. They must be from 18 to 35. In the printing office an apprenticeship of two years is required as pamphlet sewers. These women work in the same shop as the men, and are paid at exactly the same rates. After twenty years' service they are retired with a pension of 400 francs ($80). Recommendations from influential persons are requisite for obtaining places in the Bank of France. In order to obtain employment in the administration of the railways it is necessary to be either the daughter, wife or widow of an employee. Nearly 500 ladies are thus employed. Indeed, at French railway stations the ticket sellers are nearly all women. In the railways there is not the same just payment as in the other State departments; here the women are paid just half as much as the men, while working quite as much. The *Credit Foncier* employs about 2,000 women on its staff; the entrance is by examination and the limit of age, 16 to 35. Candidates must produce good conduct certificates, both official and private, and must receive at the examination a maximum of marks, that is to say, 12 out of 20. The salary in the first stage is 3 francs a day, rising to 1,700 a year ($340). A tax of 4 per cent. levied upon the salary gives the right to a pension after twenty years' service. In the Credit Lyonnais women are also employed. For their entrance there the rules are not yet fixed. A cashier receives the salary of 2,000 to 2,500 a year, and a clerk from 3 to 5 francs a day. In the Post, Telegraph, Telephone and Postal Savings Bank Departments women are employed as follows: 1. As aids in offices of secondary importance. 2. As employees at the telegraph and telephone offices in Paris and important towns. 3. As clerks in the savings bank and book-keeping departments of Paris. 4. As receivers. The personnel is recruited from the auxiliaries, who must be 16 years of age and free from any weakness which would prevent their being employed in any branch of the service. These aides are under the direction of the receivers, and rise by examinations. Postulants must prove that they have lived honorably in company with persons of their own families. Age for entrance, 18 to 25. The relatives of employees have the right to come up first for examination. The value of the appointments varies from 800 to 1,800 francs a year, rising at the rate of 100 francs at a time. Posts in the savings bank are reserved as far as may be for the wives, daughters, daughters-in-law, and sisters of public servants and officers of the army and navy. There is no European country in which women clerks are more employed than in France. Indeed, it is rare to enter a French shop and find a man serving as accountant. Book-keepers are paid from 1,000 to 3,000 francs a year, and accountants much the same. In the commercial houses, where women clerks are also employed, they often have an interest in the business. In trades, properly so called, the apprenticeship is regulated by contract, and in most cases French nationality is indispensable. The limit of hours of work for women is fixed by law at eleven daily after 18 and at ten for children under 13. There are seventeen institutions in Paris alone for the teaching of different trades. Those that are dangerous to health are forbidden to young children. The term of apprenticeship naturally varies according to the nature of the employment. Some trades are very intermittent in their times of work. Thus basters do not work during January and April, and are paid about 35 centimes an hour. In embroidery no work is done in June, July, and August; if skilful, the workers are often paid at rates varying from 3 to 25 francs a day. Embroidery in silk and wool is especially well paid. The making of soldiers' linen is remunerated at the rate of from 30, 40 to 45 centimes an hour. Corset-makers for nine hours' good work receive an average of 4 francs a day. Dress-making is very well paid, and so is the sewing of furs and the making of costumes for theatres. Ready-made clothes for export can generally be worked at home, and sometimes mantuamakers and ready-made dress-makers can also take their work to their own abodes. The aspirant for employment in the mantua-maker's trade must learn the art of trying on, and, if possible, must know one foreign language. For these the salary is from 2 to 4 francs a day. In this trade it appears that there is no intermission all the year round. Plain white sewing is not well paid, owing to the competition of the large warehouses; but articles of *haute nouveaute*, on the other hand, are often remunerated at the rates of 20, 30 and 60 francs per garment. In men's cravat-making there is also excellent steady work, as well as in lace-making and glove-making. The trimming of bonnets, the making of bows for shoes, umbrellas and parasols, is intermittent, and so is the making of trimming of all kinds, this being dependent upon fashion. A woman can earn a decent livelihood by going out as a mender to those who have not time or capacity to do their own household work. Restoration of embroideries and tapestries is sometimes paid as much as 4 francs a day, but this work is of course very uncertain. In plaiting and ruching no work is done in January and February. In tailoring women are paid according to the quality of their work. All work for children is well paid and steady, and this includes the dressing of dolls. Women also do mattress carding, which in France is generally done in the house. Laundresses are paid by the piece. Bread-carriers are paid from 18 to 22 francs a week, according to the quarter and the custom received, besides two pounds of bread per diem. Printers, stitchers and folders are paid from 1 to 3 francs a day. A fairly remunerated occupation is the coloring of playing-cards. As lithographers, chromo-lithographers, as fillers and markers of ink bottles, as compositors, as bookbinders, good workwomen can earn 5 francs a day. The *articles de Paris* are well paid, but change constantly, according to the fashion, and the work cannot be depended upon. The making of fireworks is subject to various accidents. Too many to mention are many other small industries for women, comprising the making of small balloons, flags, steel springs for stays, and buttons. The latter is an extensive and important branch. Fairly well paid, too, are barbers' and dress-makers' dummies, but they must, of course, be fairly good looking. Fan making, in all its branches, from the simple fan to the highly ornamented, is a most important branch of woman's work in Paris, and in the case of artistic painting is often very highly paid. Well paid, too, are the artificial flower makers, for in this profession much natural taste is required. Strangely enough some branches of this profession are unhealthy. For artificial flowers there is always a certain demand, but it fluctuates according to fashion. Some girls only make one species of flower. In all trades connected with food women are, of course, largely employed. In biscuit making they need to serve a somewhat arduous apprenticeship. The manufacture of shawls is very well paid, but is fatiguing. Taken as a whole, there are not so many men employed in factories in Paris as in some other French towns. Sorting rags is a very unhealthy occupation; in this women are much employed, and receive in payment 15 francs a week. Women are also employed in leather manufactories, preparing the leather which is afterwards pressed in machines. In the making of military equipments women work equally in shops and in their own homes. Several large firms have the monopoly of this work, which is chiefly done by means of the sewing machine. In the making of perfumery, too, women are much employed; this and soap-making needs but a very short apprenticeship. Tobacco employs 1,500 women out of 1,800 work-people. For this six months' apprenticeship is needed, and the lowest salary is 3.50 a day. Weavers of fine stuff for furniture receive 3 francs a day. The weaving of galloons for carriages and ribbons for decorations is done entirely by women. Among the artistic trades that of pottery in its various branches requires special aptitude and a long apprenticeship. It is sometimes very hurtful to the health. It is paid according to quality. To the class of artistic trades belongs the coloring of fashion plates, lithography, photography, and so forth. Religious pictures, cards for first communion, and other small religious publications, are extremely well paid, especially if the

designs are original, and the illumination carefully done. It is not a little amusing to read that the imitation of autographs is a profession that is well remunerated; one would rather have thought that it would lead its author to prison. The engraving of music is largely done by women. It is well paid, but requires expensive tools. Engraving on paper is now largely supplanted by photography. Painting on porcelain and coloring glasses are all taught at the professional schools. Under the head of trades connected with printing is ranged the immense amount of work given out by journalists and publishers. The paper industries, too, give employment to a large number of women. The immense amount of work done for export only is very striking, also the great number of fancy articles manufactured, such as cotillon favors, which all require more or less taste and skilled handiwork. All these employments are evenly and steadily paid, and are regulated in a sensible and considerate manner. The French habit of classification makes it possible for any one to choose from this bookful of useful trades and professions the one most suited to her natural aptitude. Altogether, it is not without reason that Paris claims to be in the front rank of civilization. There is no other country that has such a noble record of women's work to show.

HEAT.

THE SUN'S RADIATION OF HEAT IN SPACE.

Only comparatively in recent years has the true nature of heat been properly ascertained. It was in Newton's time believed to consist of a subtle fluid, named caloric, which was mutually exchanged between all bodies. Heat is now known to be a form of motion communicated to the ultimate particles of matter by means, it is thought, of an imponderable, invisible medium, of infinite tenuity and elasticity, called the luminiferous ether. This ether is supposed to fill all space and to permeate the interstices of the hardest and heaviest substances. The glowing sun is composed of infinitesimal molecules and atoms of matter, vibrating with inconceivable rapidity in the ether which pervades every portion of his mass. The vibrations produce waves which are radiated across the vast etheral expanse to our planet at the rate of 186,000 miles a second. The ether-waves, when they come in contact with matter, set up the internal molecular motion we know as heat, and their pulsations on the retina of the eye produce the impression we perceive as light. When we stand before a fire and feel its warmth, the heat is communicated to us instantaneously, by means of the ether which pervades the chemical particles of which the air is composed. That heat and light must be conveyed in some such way as I have mentioned is now universally admitted, but it is not a truth capable of positive demonstration. Also, with regard to the sources of the sun's heat, men of science are satisfied that it cannot be supported by combustion, or to any appreciable extent by the impact of meteors, but must be recruited by the gradual contraction of the gaseous portion of the mass; though the shrinkage would be too slow for direct observation. Astronomers have calculated that at the present rate of radiation the sun could not have lasted more than about 18,000,000 years, unless the heat has been supplied by some means unknown to science. On the other hand, geologists and biologists, to meet their conclusions, require a far longer time for the past duration of the system. The antecedent probability appears to be on the side of the longer period; and what I claim is that, so far as loss of heat by radiating heat forth is alone concerned, our luminary's past duration may have been far more protracted than the longest extent now demanded. We have every reason to believe that there is, practically, as complete an absence of heat in space, as we can perceive at night there is a derth of light. The fact that the farther we ascend above the earth's surface the colder becomes the temperature of the air, makes it quite certain that the void region beyond the earth's atmosphere must be cold to the last degree. Yet the sun is supposed to be constantly performing work equal to melting ice or raising water to an enormous temperature in his surrounding medium, namely, work equivalent to producing heat outside his mass in all directions. No doubt our luminary would impart the heat in question, if he were surrounded by the ice or water. It is admitted however, that the sun is environed by a medium that must for all intents and purposes be a void. Yet it is maintained, in effect, that radiating to empty space should exhaust his energy to the same extent as the emitting of heat to the above-named substances would do. The present estimates, then, of the sun's annual expenditure are based upon the assumption that he is pouring forth in all directions the enormous amount of heat I have indicated. This assumption appears to me wholly unwarrantable. Professor Clerk Maxwell, Balfour Stewart, and, I have no doubt, all the authorities, admit that there is a great difference in form between the energy of pure radiation, or radient energy, and that of absorbed heat. It appears to me that these energies must differ as much in value as they do in form. Pure radiation is merely the result of a certain definite work accomplished within the sun, by which its vast temperature is sustained; and his expenditure of heat is not at all influenced by the velocity or rapidity of the vibration of the ether-waves, which proceed outwards in all directions. Different, however, is the case of the communication by the sun of the heat which is absorbed. We gather from the mechanical equivalent of heat—as, for instance, the energy expended in melting a large quantity of ice—and from the law of the conservation of energy, that the radiation of a vast amount of absorbed heat should have a reflex exhausting effect upon the sun's supply of energy. There is not a shadow of proof, however—the evidence is all the other way—that pure radiation could have any reflex influence of the kind. The reason assigned for the belief that the sun and each of the stars is constantly pouring forth a never-ceasing stream of heat, appears to be based on Newton's law of cooling, to the effect that "the quantity of heat lost or gained by a body in a second is proportional to the difference between its temperature and that of the surrounding medium." Newton was a persistent upholder of the material theory of heat, a view now quite abandoned. Dulong and Petid have proved that the above law is not of general application; but assuming it to be practically valid, it refers to the fact only of the amount of loss or gain of heat in a second, varying proportionally with the temperature. On a clear, frosty night, when we behold the planets with the stars, many of them far larger and hotter than our sun, gleaming in space, a medium that we know must be everywhere colder than the coldest temperature we could experience, and we are told that the sun is perpetually giving out heat sufficient to boil per hour 700,000 millions of cubic inches of ice-cold water, our sensations supply no evidence at variance with the thesis I have been maintaining. In warm weather, on the other hand, when we are enjoying the sun's light, and reflect that even at a considerable distance from his surface the most solid rocks would be quickly reduced to ashes, it may seem at first hard to realize that our luminary could only expend that stupendous energy when there was the requisite matter to operate upon. I think the difficulty arises from our still half-unconsciously entertaining the material conception of heat, and that when we form a clear representation of the undulatory theory, the notion that the sun cannot radiate forth more heat than is absorbed, appears the more natural view of the case. It appears to me that argument might be piled on argument in support of the view here advocated, and I am not aware that a single plea can be urged in favor of the received theory. Equally against it seem both the *a priori* evidence from the supposed enormously long geological periods, as well as the *a posteriori* demonstration from the mechanical equivalent of heat and the analogy of terrestrial radiation. Also, that the sun should be constantly expending in all directions a vast amount of energy for no apparent purpose, would be repugnant to our notion of the general order of things; though, perhaps, our finite minds may not always be able to decipher perfection in the works of Nature.

FASHIONABLE SQUEAMISHNESS.—Miss Brunc (*who is very fastidious*).—"Kitty, will you do me a favor?"

Miss Blonn.—"*Will* I? ask it."

Miss Brunc.—"Let Peters bring me a chocolate éclair instead of this vanilla one. It doesn't match my gloves, you know."—*Pick-me-up.*

HAPPY THOUGHT.—One day, in 1830, when a working jeweller, Joseph Gillott, now the famous steel pen maker, accidentally split one of his fine steel tools, and being suddenly required to sign a receipt, not finding his quill pen at hand, he used the split tool as a ready substitute. This happy accident led to the idea of making pens of steel.

COPPERED IRON.—A process has been recently invented by which iron may be coppered by dipping it into melted copper, the surface of the iron being protected by a layer of melted cryolite and phosphatic acid. It has been found that if the article when immersed is connected with the negative pole of a battery the coppering is done more rapidly.
